INDEX OF CONTENTS.

JULY TO DECEMBER, 1894.

A

BELIA rupestris, 307, 629
bies Pinsapo and A. Nordmanniana hybrid, 506
butilon vitifolium, 373
cacias, Worthing, the, 217
cacias, the culture of, 760, 785
crophyllum venosum, 118
diantum capillus var. cornubiense, 667
dvertisers, a caution to, 292
cidium asperifolii, 222
crides quinquevulnerum, 246; A. Savageanum, 562
ganisia ionoptera, 507
garicus arvensis, 444, 510
gave americana, flowering of, 101
gricultural education in Aberdeenshire, 442; returns of Great Britain, 254; statistics, 755
phand, M., *proposed* statue to, 100
pines, winter treatment of tender, 718
ps, Maritime, Orchids at. 776
nateurs' column, 37, 74, 757, 785
nateurs' garden, hardy flowers for, 785
nerica, Carnations, in, 668; Chrysanthemums in, 668; forestry in, 726; Roses in, 668
nerican Florists, Society of, 346
nerican Florist, the, 344
nerican notes. 257, 668
nerican Tariff Bill, 284, 374
npelopsis hederacea, 563; A. Veitchii purpurea, 468
alysis of fresh Figs, 38; of Chrysanthemum, 18
emone japonica, 402; A. j. "Whirlwind," 661, 697
ts as gardeners, 9
twerp Exhibition, the, 96, 191, 332; decorations in connection with the, 728; exhibitions of dessert-fruit and Dahlias at, 507
iary, the, 157, 251, 313, 631
ple crop, the, 348; of Nova Scotia, 285
ple, Manx Codlin, 700; Washington, 627, 667, 700
ple trees, old, grafted, 700
ples at Maiden Erlegh, 316; at South Stoneham House, 346; large Devonshire Quarrenden, 346
achnanthe moschifera, 435
alia nymphæifolia, 191
aucaria imbricata, 603
aucarias in Scotland, 637
boricultural Society's Excursion, Royal Scottish, 258, 223
istolochia gigas, 73; A. g. Sturtevantii, 223; A. trilobata, 306
um Dracunculus, 16, 46
h at Woburn, the old, 446
hby-de-la-Zouch, Manor House, 161
Ash-growing, waste in, 156
Ashridge, notes from, 761
Asparagus sarmentosus. 746
Aucuba japonica vera, 628
Auricula, the, 278, 593, 760
Azara microphylla, 510

B

Bacteria, action of light on, 292
Bacteria and insect pests, 776
Bananas, products of, 135; how to protect from flying-foxes. 285
Barker, Mr. Michael, 190
Bateman, Mr., his garden at Worthing, 345
Bath, the lake in the Victoria Park, at, 11
Bean. Veitch's climbing French, 376, 403, 446
Beans in Scotland 509
Beans, jumping, 761
Beans, Kidney, transplanted for early cropping, 136
Beans, the seed crop of, 407
Bearwood, Wokingham, 137
Beckford Hall Gardens, Box avenue at, 751
Bedding in Hyde Park, 137
Beet, Silver, 729
Beet-sugar in Persia, 777
Begonia, Beauty of Eynsford, 723; B. Haageana, 632; B. hermaphrodite variety, 221; hybrida Pioneer, 723; B. President Carnot, 399; B. Rajah, 213
Begonias, 349
Begonias, hybrid autumn and winter, 498
Begonias, tuberous-rooted. 416
Belgian Press Congress, 96
Belgium, horticulture in, 98
Belgium, notes from. 159, 507, 630; Peach culture in, 691
Benefit and Provident Society, United Horticultural, 44, 440
Bennet, monument to the late Dr., 756
Benthamia fragifera fruiting in Dunster Castle Gardens. 666
Berberidopsis corallina, 629
Berberis Mahonia, 192
Berlin, a Cactus show in, 507; Chrysanthemums at. 723; a gardener's education in, 596
Bermuda, 698
Betonica grandiflora 11
Betulas of Japan, 506
Bicton Gardens, 529
Birds, wild, 182
Birmingham Botanical Gardens, 44
Blackmore, Mr., on fruit growing, 541; *see* Fruit, fiction, and fact
Black Currant bud-mite, *see* Currant
Blechnum *v.* Lomaria, 401
Blickling Hall, 533

BOOKS,—NOTICES OF: A Chrysanthemum Catalogue (*M. O. de Meulenaere*), 344; Agricultural Zoology (*Dr. J. Ritzema Bos*), 403; A Handbook to the Study of Natural History, for the Use of Beginners (*Lady Isabel Margesson*), 131; A Manual of Exotic Ferns and Selaginellas (*E. Baylor Hartland*), 665

Botanic Garden, Glasnevin, 783
Botanic Garden, Oxford, 7, 63
Botanical Magazine, 72, 315, 442
Bouvardia leiantha. 700
Bravoa Bulliana, 63; B. geminiflora, 63
Briar hybrids, the new sweet, 565
Brighton and its horticultural society, 285
British Association, the annual meeting of the, 188

British wines, 314
Brærnar, Ealing, the garden at, 63
Brook House, Isle of Wight, 160
Broughtonia sanguinea, 627
Buds, adventitious, on Kniphofia, 437
a new material for binding Rose, 315; change in the nature of, 664
Buitenzorg Botanical Garden, 397
Bulb garden, the, 627, 776
Burford, Dorking, 134
Burning charcoal, 694

C

Cactus show in Berlin, 507
Calanthes, 748
Californian fruit, 257; notes, southern, 436; Oranges and Lemons, 229; plants, 19
Callistemon salignus, 92; C. speciosus, 92
Calochortus Plummeræ, 76, 133; C. Weedii, 183
Cambridge Lodge, Orchids at, 594
Cambridgeshire, rural industries in, 92
Campanula Medium, 317; C. pyramidalis, 310; C. sibirica divergens, 516
Campanulas, 101
Canary-seed culture in Turkey, 449
Cardiff Castle vineyards, 314
Cardiff, the new park at, 11
Carex brunnea, 543; C. japonica = C. brunnea, 543
Carnation and Picotee, 64
Carnation-house at Coombe, Lewes, 281
Carnation, the, 135, 153, 278, 732. 760
Carnations, the culture of tree, 674
Carnot, flowers at funeral of, 159
Castle Boro, Enniscorthy, 65
Catalpa bignonioides, 506
Catasetum imperiale, 775
Caterpillar plague in Hong-Kong. 578
Cattleya, a singular, 720; C. Bowringiana, 720; C. × Hardyana, Leopold II., 720; C. labiata, a specimen plant of, 626; C. l. alba, 180; C. l. autumnalis alba, 723; C. l. Foleyana, 627; C. l. Gaskelliana, 93; C. l. Measures' variety, 563; C. maxima gigantea, 756
Cattleya Rex, a free flowerer, 213; at Stand Hall, 180
Cattleya Victoria Regina, 594
Ceanothus not hardy, 101; the genus, 368
Cedar cones, 603; Cedar of Lebanon cone bearing at Weston Birt, 702; Deodar at Dropmore, *see* R. H. S. report, 760
Charcoal burning, 694
Chasselas Grapes, 497
Cherries, Morello, 223
Chimatobia brumata, 474
Chiswick notes, 8, 342, 372, 403
Chiswick, visit of the fruit committee to, 76
Chitty, the late Mr., 666
Chivers & Sons, celebration of the commercial majority of, 92
Chondrorhyncha Chestertoni, 720
Christmas requirements, 689, 758
Christmas trees, 756
Chrysanthemum Black Prince, 785
Chrysanthemum, exhibition of, in Japan, 717; Florence Carr, 603; food requirements of the, 45, 74; giving same sport in widely distant places, 668; "Hairy Wonder," 538; lacustre, 402; Madame Walther, 636; show boards, 573; Viviand Morel, sporting of, 700
Chrysanthemums, 600; about London, 475, 500, 538, 565, 595; at the Guildhall, 634; catalogue of. 344; floriferous plants of, 404; in Berlin, 723; in the provinces, 508; manure for, and ash of, 18; mildew on, 509; new, 732; select Japanese decorative, 438; training, 504 (*see* Societies)
Cienkowskia Kirkii, 38
Clematis and Roses, 182
Clematis, Countess of Onslow, 9. 45
Clerodendron nutans, 562
Clethra alnifolia, 250; C. paniculata, 289
Cochlioda Noezliana, 71
Cockchafer grubs, destruction of, by a fungus, 697
Cocoa—coca—coco—Cocoa-nut, 198
Cocoa-nuts and Brazil-nuts, 704
Cocos, the preparation of, in Caraccas, 416
Cœlogyne speciosa, 246
Coffee in Nyassaland, 73
Coleus, 222
Colonial fruits and woods, 70
Colonial notes, 185, 229, 752
Colours of flowers, the, 611
Colutea melanocalyx, 155
Colutea with two pods in a flower, 159
Combretum purpureum, 92
Cones of Cedars, 603, 702; position of male and female, 541
Conference on gardening, a, 44
Congenital fasciation, 506
Congress, French Horticultural, 505
Conifers, protection against cold in, 16
Continental novelties, a new Melon, 694
Co-operative show at the Palace, the great National, 220
Copper-sulphate and Potatos, 697
Corea, notes about, 623
Coreopsis grandiflora, 402
Cornus capitata, 74
Cornwall, fruit cultivation in, 434; hedges in, 477
Cornwall in December, 756
Costus igneus, 306
Covent Garden Flower Market, 5
Cratægus pyracantha Lelandi, 564
Creepers for stoves and greenhouses, 45
Crinum abyssinicum, 63. 134
Crinum Moorei, 603, 636; C. Schimperi, 134
Crosses, false, in Strawberries, 568
Cucumber culture, 256; failure in, 98
Cucurbits, results of crossing, 755
Cup and tube, the Springthorpe, 479; the telescope, 604
Cupressus Knightiana, 668; C. Lawsoniana gracilis aurea, 192; C. macrocarpa, 658
Currant-bud Mite, of the Black, 293, 540, 572, 603, 758
Currants attacked by Puccinia ribis, 135
Cynoches pentadactylon, 180
Cypress, Knight's, 668
Cypripedium Adonis, 657; C. Calypso, 35; C. Canhamiæ, 667; C. Curtisii, 212; C. J. H. Veitch, 287; C. Lawrebel, 657; C. × Leeanum giganteum, 774; C. Mendeli, 152; C. spectabile, 74; C. Stonei platytænium, 246; C. William Lloyd, 757

D

Daffodil, a green, 698
Daffodil, Sir Watkin, 773
Dahlia, Grand Duke Alexis of Russia, 408
Daisies, Michaelmas, 509
Darwinias, the culture of, 35
Dates in Tunis, 255
Dean Hole in America, 668
Dean, Testimonial to Mr. W., 44, 602
Dendrobium culture, 690
Dendrobium Devonianum, 8; D. Johnsonæ, 339; D. Phalænopsis Schroderianum, 339, 720
Devon and Exeter Gardeners' Association, 443
Disa × Langleyensis, 35
Disa nervosa, 308; D. Veitchii ×, 93
Diplacus, some showy species of, 19
Disease of the Lily and Iris, 221, 255, 444
Diseases of Plants and the Belgian Botanical Society, 728
Dishing fruit, 700
Douglas Fir, golden, 44
Douglas, Robert, 310
Dublin, waterfall at Stephen's Green, 568
Duchartre, the late M., 600
Dunkeld, the parent Larches at, 756

E

Ealing Gardeners' Association, 407
Easter Daddingston, the garden at, 248
Echinacea purpurea, 218
Echinocactus Zuccariniana, 701
Echinopsis Decaisneana, 624
Eczema, caused by Primula obconica, 760
Edinburgh Royal Botanic Garden, notes from, 306, 673, 785
Education, agricultural, in Aberdeenshire, 442; technical in Middlesex, 407
Elder, a variegated, 438
Electricity in horticulture, 221, 756
Epidendrum bicornutum, 336
Epi-Lælia × Hardyana, 629
Eremurus robustus, 45, 74, 312
Erfurt, notes on the season's vegetables and seeds at, 570
Ericht Bank, view of the flower-garden and lawn at, 473
Erigeron philadelphicus, 11
Erlescliffe, Cheshire, Orchids at, 626
Eryngium amethystinum, 289, 338, 376; E. planum, 724
Essex, a rectory-garden, in, 591
Eucalyptus species, 74
Eucharis grandiflora, 666, 758
Exhibition, the Great International Horticultural and Botanical Congress of 1866, 197
Exhibition-stands for Chrysanthemums, size of, 603, 636
Exhibitions, proportionate prizes at, 191
Exhibits, relative value of, 18
Exhibits, trade, at flower-shows, 637, 759

F

Fagræa zeylanica, 543
Faradaya splendida, 364
Fasciated Holly-branch, 510
Fasciation, congenital, 506
Fernery in the garden of L. Marquard, Cape Town, 601
Fern Paradise, a southern, 34
Ferns in windows, 655
Fertiliser, a home-made, 564
Fifteenth-century gardening, 363
Figs, analysis of fresh, 38
Filmy Ferns, lecture on, 103
Fir, Silver, disease in the, 254; Fir, Douglas, a golden, 44
Floral decorations at Buckingham Palace, 44
Florists' flowers, 8, 64, 218, 278, 502, 598, 611, 732
Flower garden, the, 12, 41, 69, 97, 127, 157, 187, 219, 251, 283, 312, 341, 371, 405, 439, 470, 502, 535, 566, 599, 631, 663, 695, 724, 753, 779
Flower market at Covent Garden, 5
Flower-rack, the Martin, 17
Flower shows, attendance at, 785
Flowers and grasses, dyed and artificial, 784
Fodder, Lathyrus, 730
Footpaths, a new system of treating, 198
Forest destruction in America, 543
Forest management, 404
Forests, thinning, 364
Forestry, 156, 193, 293, 339, 364, 401, 564, 629, 658; in America, 726; lecture on British, 754; the use of scientific, 366
Forget-me-not, the creeping, 11
Freelands, Perthshire, 542
French Horticultural Congress, 505
Fruit and the May frosts, 316
Fruit at Iddesleigh, 757; at the Drill Hall, 758
Fruit, British, and its prices, 372, 404
Fruit crops, at Severn Stoke, 126; in Germany, 286; in the United States, 285; remarks upon the, 149, 181, 247, 255, 287; reports on the, 117, 119
Fruit cultivation in Cornwall, 434
Fruit, dishing of, 700
Fruit, fiction, and fact, 509, 541, 573, 602, 636, 668 701, 753, 785
Fruit, exhibition of British, 342; growing on a large scale, 413
Fruit frauds, checking foreign, 374
Fruit in Germany, 657
Fruit, marking foreign and colonial, 473; packing, 510; competition at the Crystal Palace, 444, 447
Fruit, packing, grading, and marketing, 415
Fruit-room, a cheaply-erected, 637
Fruit show, the Crystal Palace, 17, 74, 162, 406, 440, 444; supplies, our, 436; lessons of, 403; to Japan and China, 408
Fruit-tree spraying at Cambridge, 37
Fruit trees, moths on, 474; young standard, 136
Fruit wines, 183
Fruits, hardy, for small gardens, 412; red poison, 750; root suckers of stone fruits, 381; seedless, 190
Fruits under glass. 13, 41, 68, 96, 127, 156, 187, 219, 251, 282. 313, 341, 371, 405, 438, 471, 503, 535. 566, 599, 631, 663, 695. 725, 753, 778
Fungus hunting in 1894, 469

G

Garden apprentices, 288
Garden apprenticeship premiums, 317
Gardening in Nice, 368; in Ross-shire, 703; in the fifteenth century, 363
Gardeners and their employers, 252, 288
Gardeners' guild, a, 14
Gardeners' Royal Benevolent Institution, 666, 698, 729, 782
Garden walls, value of, 730
Gas heating for greenhouses, 783
Gates, Oak *v.* Deal, 292
Genista virgata, 7
Genoa, vegetable products of, 438
Geranium Endressi, 161
Germany, fruit crops in, 286, 657
Ghent Quinquennial Exhibition, 783
Gladiolus aurantiacus rubro-tinctus, 152; G. platyphyllus, 152
Glasgow Botanic Garden, notes from, 673
Glasnevin Botanic Gardens, 783
Glass, plants under coloured, 130
Gloxinia, the, 8
Gloxinias, 288; at M. Kegeljan's, 159: specimen, 254
Gordonia anomala, 785
Gower, testimonial to Mr. W. H., 73
death of, 138
Grafted old Apple trees, 700
Grape, Foster's Seedling, 785
Grape-packing for long journeys, 706
Grape Raisin de Calabre, 317
Grapes at the Crystal Palace fruit show, 510
Grapes, Chasselas, 497; going off. 128
spot on, 44; the setting of, 128
Grasses and flowers, dyed and artificial, 784
Green Daffodil, a, 698
Greenhouse plants. hard-wooded, 35, 118, 533, 720, 760
Green manuring, 228
Grevillea Banksii, 14
Growth of plants, the, 291
Grubs of cockchafer, destruction of by a fungus, 697
Gunnera manicata, 222
Gunton Park and gardens, 369
Gynerium saccharoides, 364

H

Habenaria carnea, 507; H. militaris, 507; H. Susannæ, 278, 510
Habenarias at Burford, 467
Hæmanthus candidus, 134; H. Clarkei ×, 498
Harborne Hall, ornamental water at, 56
Hardy fruit garden, the, 12, 40. 69. 97. 126. 157, 186, 218, 250, .283. 312. 341, 370, 405. 439, 471. 503 534, 567, 598 630, 662, 695. 752, 779
Harvard University, a gift to the botanical department of, 100

Harvey Lodge, Roupell Park, S.W., 348
Havana, Tobacco and Sugar in, 17
Heating, early experiments in, 130
Hedges in Cornwall, 477
Hedychium Elwesii, 152; H. Wilkeanum ×, 317
Hedysarum coronarium, 305
Helianthus rigidus var. Miss Mellish, 374
Heliotrope, the Peruvian, at Antwerp, 159
Herbaceous border, the, 11, 40, 91, 160, 218, 338, 402, 724
Herbaceous border at Kew, 281
Herbaria, the utility of, 70
Herb Waller, 506
Hermaphrodite Begonia, 221
Highbury, 699
Highclere Castle, 211
Hippeastrum Andreanum, 364
Hole, Dean, in America, 668
Holly, fasciated branch of, 510
Hollyhock, the, 218
Holmes, Oliver Wendell, and his love for trees, 440
Home House, Worthing (Mr. Bateman's), 345
Honckenya ficifolia, 498
Honeyden, Foots Cray, 91
Hop, the nettle-headed, 100

SALES BY AUCTION.

HIGHLY IMPORTANT SALE

of the Second Portion of the famous

PICKERING LODGE COLLECTION

OF

ESTABLISHED ORCHIDS.

Formed by the late George Hardy, Esq., and reputed to be the grandest lot of Plants in the North of England, having won the highest honours at Manchester and other leading shows.

By order of the Executors, without the slighest Reserve.

MESSRS. PROTHEROE AND MORRIS are favoured with instructions to SELL by AUCTION, on the Premises, Pickering Lodge, Timperley, near Manchester, on WEDNESDAY and THURSDAY NEXT, July 11 and 12, at half-past 12 o'Clock precisely each day, the Second Portion of this far-famed Collection. The whole of the plants are in the best possible health, and are remarkable alike for their size and the grandeur of the varieties. For upwards of twenty years the late Mr. Hardy was an enthusiastic buyer and a keen judge, and made a practice of discarding from his collection all varieties that did not reach the highest standard of excellence. In order that intending buyers may judge for themselves of the beauty of the varieties, an effort will be made, as far as practicable, to offer everything in flower.

Amongst the numerous items to be offered in the Second Sale may be mentioned specimen plants of—

Cypripedium Stoneii, lævigatum, Sedenii candidulum, Selligerum majus caudatum; also C. bellatulum, vexillarium superbum, Barbatum Warnerii, Lawrencianum, Veitchii, Curtisii, Rothschildianum, Lowii, fine plants; C. Aylingii, C. bellatulum, hardy var.; First-class Certificate, Temple Show, 1894

Cattleya Mossiæ Hardyana

„ „ Hardyæ. This is a unique variety, and far superior to Reinechiana

„ aurea, several fine plants

„ „ chrysotoxa, several fine plants

„ Rex, several fine plants

„ Aclandæ

„ Schilleriana

„ Mendelii Bluntii, fine plant [plant

„ labiata pallida, grand

Lælia grandis tenebrosa

„ purpurata, Boscowan's variety, the original and only plant

Lælia xanthina

„ elegans Morreniana, specimens

„ „ Stelynesiana, specimens

„ „ alba, specimens

„ „ atro-rubens, specimens

Lælio-Cattleya hybridum Arnoldiana, grand plant and variety

„ „ „ Canhamiana

Dendrobium Statterianum, strong plant

„ album, strong plant, very rare

Anguloa Ruckeriana, several plants

Cœlogyne Massangeana

Sobralia Lucasiana, immense specimen

„ xantholeuca, immense specimen

„ „ alba, fine plants

„ species

Odontoglossum crispum, several hundred

„ Pescatoreii, Polyxanthum, Halli, Harryanum, pulchellum majus

„ vexillarium rubellum

„ „ superbum, six fine plants

Vanda teres, several specimen plants

Thunia Marshalliana

Phalænopsis violacea.

The majority of the plants will be in flower, and every plant in the entire collection will be Sold by Auction, without reserve.

The plants may be inspected on Tuesday between 10 and 5 o'Clock. Catalogues may be had of the Head Gardener, Mr. HOLMES, on the Premises; and of the Auctioneers, 67 and 68, Cheapside, London, E.C.

BY ORDER of MESSRS. LINDEN, BRUSSELS.

FRIDAY, JULY 13, NEXT.

MOST IMPORTANT SALE of a GRAND LOT of

CATTLEYA MENDELI,

Just arrived in magnificent order, including many large and superb masses. It being well known that this beautiful Cattleya is becoming very scarce, these plants have been collected at a great sacrifice, personally by our collector, Mr. Ed. Klaboch, who has informed us that a large number of magnificent varieties will be found among them.

CATASETUM BUNGEROTHI.

Messrs. LINDEN have just received another small but fine importation of this grand Orchid, including many large and most distinct pieces, much finer than they have had the pleasure of offering before.

LYCASTE ROSSIANA (R. A. Rolfe).

A splendid rare Lycaste, with golden-yellow flowers, fine established plants of the same.

Also a number of other choice ORCHIDS, including BIFRENARIA (LYCASTE), MYRIANTHINA, CYMBIDIUM EBURNEUM, COCHLIODA NOETZLIANA, in Flower, and others.

TO BE SOLD by AUCTION, by Messrs. PROTHEROE AND MORRIS, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY, July 13, at half-past 12 o'Clock.

On view morning of Sale, and Catalogues had.

Preliminary Notice.

MESSRS. PROTHEROE AND MORRIS have received instructions to SELL by AUCTION at their Central Sale Rooms, 67 and 68, Cheapside, E.C., a fine PRIVATE COLLECTION of ORCHIDS, consisting of some remarkably well-grown specimens, and many extra good varieties (Cattleyas especially).

The whole will be offered for sale, without reserve, on TUESDAY, July 24th next, in consequence of the owner having sold his estate and removing from the neighbourhood.

July 17 and 18 Next.

F. C. CALVERT AND CO., Manchester.

DENDROBIUM HILDEBRANDTI,

(n. sp. Rolfe).

MESSRS. CHARLESWORTH, SHUTTLEWORTH, & CO., HEATON, BRADFORD,

Have great pleasure in offering this great Novelty, which will be a valuable addition to the charming group of Dendrobiums. The flowers are sulphur-yellow, a trifle darker towards the centre; 3 to 3½ inches diameter; lip of same colour, unusually large and open, with an orange-coloured blotch in the centre. The flowers are borne on short spikes. The plant is quite distinct in appearance, resembling slightly Dendrobium nobile; the bulbs, however, are flat, varying in size from 10 to 30 inches, and show an abundance of old flower-spikes, and we do not remember seeing a plant which shows such a freedom of flowers. It has been an expensive plant to import, coming from a remote and uninhabited district, as it is only from such places New Plants particularly Dendrobiums, can be found. The plants are in splendid condition, and we are prepared to replace any plant which should die within three, months from date of purchase.

PRICE, SIZE, and FULL PARTICULARS, ON APPLICATION to

MESSRS. CHARLESWORTH, SHUTTLEWORTH, & CO., Orchid Importers and Growers, **HEATON, BRADFORD, YORKS.**

CAMERON & CO., 178, Charing Cross Road, London, W.C.

A STERLING NOVELTY.

NEW PERPETUAL CARNATION

"URIAH PIKE."

Awarded Certificate of Merit and Medal from the Royal Botanical Society.

This is undoubtedly the finest Carnation that has been offered to the Gardening World for many years, in fact a "March past" all other Carnations. It is a lovely crimson-maroon in colour, splendid habit, a vigorous grower, and most profuse bloomer, strong clove-scented, and throwing its perfect-formed flowers on long stems, which is an indispensable quality; the calyx does not split, and *resists disease*. This Carnation has been grown for several years (for cut bloom only) for all the leading Florists in the kingdom, and is acknowledged by them to be the finest Carnation for all Floral decorations, its lasting proclivities in a cut state being marvellous. It is now offered for the first time to those requiring a genuine Novelty.

Plants now ready at the following Prices:—

	Each.	Per doz.
3½-in. POTS	2/6	24/-
FLOWERING PLANTS, in 5-in. Pots...	5/-	50/-

SATURDAY, JULY 7, 1894.

THE FLOWER MARKET, COVENT GARDEN.*

(*See Illustration, p.* 17.)

"IT is only through such a channel as a public market offers, that the genuine stamp of popular approval can be obtained, and the business and commercial value of any fresh articles introduced for public supply can be truly tested. One thing is certain, and that is, that there is no advertisement in the world so powerful for a really good article as its exhibition on a grower's stand side by side with its rivals.

Perhaps I may be pardoned if I turn back and give a brief review of the history and growth of the market before speaking of its present flower supply.

THE HISTORY OF THE MARKET.

It may be interesting to know that in 1828, when the present regulating Act of Parliament under which the market is managed was passed, the area of the chartered market was divided into eight different sections for various purposes. These were named after the first eight letters of the alphabet, and varied much in size. Section H, the smallest and last, was the portion assigned for flowers; it contained twelve small stands, about equal to one-hundredth of the market area, and had no provision for shelves, or other method of exhibiting the goods, except the floor-space, which was uncovered. Such was considered sufficient provision for the wants of that time, and continued so for many years.

The growth of the public taste for flowers is a most marked illustration of the advance of the age in which we live. Doubtless, many causes have worked together contributing towards it, such as—

1. The increase in the wealth of the manufacturing and trading classes, enabling them to acquire and indulge in more refined taste.

2 The increase of London, by the retirement of its more prosperous citizens into suburban residences, with gardens and conservatories attached.

3. The public exhibitions, and the shows of the Royal Horticultural Society, doubtless stimulated and directed public taste.

4. The spread of education amongst the working classes, had a decided tendency to create amongst them a taste for the beautiful.

5. The migration into London of country folk, who regarded a window-plant as a connecting link between the new life in town and the green fields of happy memory left behind.

6, and lastly. The fashion of the times, which led people to beautify and adorn their tables and rooms with floral decorations; and also to express affection and regard for the living, and esteem and respect for the dead by floral offerings. Even the revival of ritualistic ceremony in religious worship has had its share in contributing to a general demand for flowers.

And how has this gradually-increasing trade been provided for? In 1848 it was found that the flower-stands, section H, was totally inadequate for the then trade. It had already begun to be patent to a

* From a paper read before the Horticultural Club by Mr. Assbee.

few pioneer growers, that a public want required to be met, and a rapid increase developed itself. No longer was it possible for the church porch, and the piazzas round the market square, to give shelter to the improving and increasing supply of plants.

Then arose the question of a flower market pure and simple. It happened that the leases of certain houses at the south-east corner of the market fell in at this time, and after an experiment the first flower market was built.

This increased facility for the trade soon had the effect of still further stimulating the public demand. As plants and flowers became better grown and better known, they became better appreciated, and the market gave still further signs of want of space. In fact, it was like a growing youth whose limbs had outgrown his clothes. Like a good father, his Grace resolved to buy the lad a new suit, and in 1886 the present market was completed. [Illustrations of the market were given in our columns for February 10, 1872, and July 18, 1885]. I must say the young man still continues to grow, and additional provision for his pressing wants will have some day to be made. At present, a portion of the overflow market, consisting of bedding-out plants for gardens and window-boxes, finds accommodation in the enclosed area between Tavistock Street and the market on the south side.

So much for the history of the rise and progress of the market. Now for a look at it as it is. I suppose most of us have visited Covent Garden Market during business hours. If any have not, I trust they will take an early opportunity of doing so. The practical gardener can here critically examine the various plants and flowers, and compare them with those of his own growing. The lover of plants and flowers will flit from stand to stand with a wondrous uncertainty regarding which is the most beautiful and deserving of the lot. The curious and inquisitive will ask all sorts of questions respecting how things are so grown, and the quantities brought, and where they come from, and where they go to; and if he is inclined to mathematics he will probably set himself sundry curious problems based upon data he receives.

The sentimental will probably float on some wild flowers, and in the search for Forget-me-Nots probably venture into the outer area, where rough-looking gipsy chaps dispose of moss, Ferns, and Water Lilies. On her return (I suppose the visitor to be a lady) she will possibly express a wonder that such rough, unwashed, and altogether disreputable-looking individuals should be associated with her pet flowers, and why flower-girls should be such a coarse, dirty, draggle-tailed lot, and why the duke or somebody else does not provide them with clean tall Normandy caps and picturesque gowns and aprons.

Of all visitors to Covent Garden a market-stroller is perhaps the being most objected to by business people. Here let me say that, though the market may be written of and spoken of, and is often visited as a flower show of the free-and-gratis order, it is primarily and essentially a place for the sale of goods, and not for exhibition. To those who visit it daily for business purposes its beauties cease to have the charm of novelty. In the business of a busy market there is little time for leisure or sentiment. Each trader goes for the particular plants and flowers he requires, bestowing scarcely a thought or glance on others, and it is to this business portion of the market I must now come.

The Dealers and Their Customers.

We will, if you please, consider ourselves strictly market people. Each and every morning all the year round we are there at the opening of the doors. Our wants vary with the seasons, and for these the grower must provide. Now, there are two classes of growers: one class regularly attends, and has always something to bring; the other class only attends at certain seasons, either because they are specialists, and grow only a certain class of stuff, or because they are fruit as well as flower-growers, and consequently only grow such flowers as suit their convenience. The former class is your true market flower-grower; he has to provide a succession of goods for every day of the year. Then, again, this growing business naturally divides itself into different sections:—1. There is the pot-plant trade, with its two great parts—(*a*) flowering plants, and (*b*) foliage and decorative plants; and, 2, the cut-flower trade.

Pot Plants.

The former requires great experience, great labour, and great judgment, with often but little profit. The rage for pots of flowers has somewhat gone out of late years. But only look at the market when full of them in their season—the size, so suitable to their purpose; the training, so admirable; the blooms, so near perfection. Take a few examples. Mignonette, six to eight giant trusses in one small pot; the Pelargoniums, a mass of bloom; the Fuchsias the same. Only try to grow them yourself, and then you will see to what extent the market-grower is a master of his art. Then take single stalks with heads of bloom, say, Hydrangeas, or Liliums, or Arums; or take the perfection to which Ericas are grown for market, to say nothing of the commoner flowers, such as Marguerites, Pelargoniums (especially Ivies), Calceolarias, and others, huge banks of which are daily to be seen. Then, again, in winter time and early spring, the pots of Lilies, Hyacinths, Tulips. These, with others, form a never-ending succession.

The foliage plants are also marvels of fitness for their purpose. Palms of any size, Ferns, Ficus, Crotons, and Dracænas are ever present, in quantities equal to any call upon the trade. Solanums form a special market feature in their season.

There has lately sprung up quite a new business field in foliage plants. I allude to small thumb pots of assorted goods, about a dozen or fifteen, each in small wooden boxes. These find great favour with purchasers who have cool greenhouses where they can grow them on to fair-sized plants. Nearly 1000 boxes a day, of fifteen pots in a box, have been sold by one grower. It is curious to know how many boxes are obtained — Tomato-boxes, Pine-boxes, Orange-boxes, old ones utilized for this purpose after the fruit is sold.

Before leaving the box-trade, I must speak of the early spring bedding-plants. Many thousand boxes of blue Lobelia, struck cuttings of Calceolarias, Fuchsias, seedling Asters, Stocks, Pansies, Mimulus, Musk, Nasturtiums, plants for edgings, plants for bedding, and taller-growing varieties for backing, both annuals and perennials, are daily sold. These are often grown by small jobbing gardeners under very primitive frames, and are brought in small loads and sold in the Area in Tavistock Row. This is really the cottagers' market.

Cut Flowers.

Now, for the cut flowers. Difficult as it is to convey any adequate notion of the pot-trade, the cut-flower trade is more difficult still. People do not replenish boxes of window-plants very often, or plant out their gardens every day. Many have no garden to plant, and do not keep window-boxes. But with cut flowers, it is quite another thing; with great care and attention they can rarely be kept fresh many days, and require constant renewal. Then they are used for so many purposes where pots could not serve. Everybody can find a place for cut-blooms: the table, the sideboard, the mantelpiece, the button-hole, wreaths, baskets, and bouquets. When you think what the daily consumption of cut flowers in London amounts to, and look at the number of florists' shops, and the barrow-loads of the street-hawker, and baskets of the flower-girls, you must think what Covent Garden cut-flower trade is. When we consider again that market-growers not only supply London, but send many hundreds of boxes of cut-bloom daily into the large provincial towns, you will get some notion of the importance of this branch of the business.

Now, this cut-flower trade is divided into two sections like the pot trade, viz., the regular daily flower-grower, and the occasional or season grower. In addition to these, we have the amateur or gentleman's gardener, who uses the market to dispose of his surplus. There are also distant senders who supply the market with goods, for cut flowers can be sent almost any distance. These distant and occasional senders have necessitated the commission-salesman as a stand-holder in the market. Another personage also finds employment in the cut-flower trade, viz, the "higgler" or middle-dealer. The London market in flowers, as in fruit, is practically open to receive any produce which can reach it in a saleable condition; and many thousand packages arrive from France, Italy, Holland, Belgium, Germany, the Channel Isles, Scilly Isles, and every nook and corner of the British Isles. These often arrive at a time when the flower-market is closed, and if in bulk are sold by auction, generally on the bye-day, to the higglers, who retail to buyers on market mornings.

Foreign Rivals.

This competition between the local home-grown and the distant and continental flowers, is becoming every year more pronounced, and is especially trying to certain growers. The advantages of climate enable the French and Riviera flower-growers to send blooms to this country, grown at little expense in the open air, which compete against similar goods forced here under glass.

It is a matter of opinion whether a certain amount of foreign trade, especially in blooming shrubs, such as the Acacia, and in Ferns, does not encourage the flower trade generally, and whether the earlier-produced continental flowers, does not to the same extent create a demand for the same flowers produced naturally in England later on.

Whatever view we take, one thing is certain, and that is, that the foreigner has felt the pulse of his English customer, and will be more and more a rival of the English producer.

One thing the foreign producer of flowers has not yet, and probably never will be able to do, and that is, to touch the best-grown and choicest varieties of market stuff. Take Tomatos and Grapes as samples in fruit particularly. What foreign goods of these kinds can equal the home-grown article? (I consider Guernsey goods home-grown). No out-of-door Grapes or Tomatos can ever equal English hothouse fruit, and for the foreigner to attempt house-cultivation, would place him on an equal footing with English growers, while his distance from the market would prevent any danger of his competition being ruinous to the home-grower. So with our best-grown English forced flowers, the Roses, Carnations, Scarlet Pelargoniums, Azaleas, Bouvardias, Tuberoses, Eucharis, Lilies, Gardenias, &c.; they need fear no rival from beyond the sea. The admirable manner in which they are grown, and the excellent condition in which they are marketed, defies competition.

There are so many features in our cut-flower trade, that I may, perhaps, be excused if I overlook some of them. Next to the wondrous succession of blooms, passing in gorgeous array, each in its time and season, like a revolving panorama, from the earliest flowers of spring to the latest Chrysanthemum of autumn, I am much struck with the excellent judgment displayed by the grower in timing his produce to suit the occasion, take Easter and Whitsuntide festivals for example; no matter when they fall, or how varied the season, there always seems an abundance of specially-grown white flowers to meet the occasion.

Perhaps I can best illustrate the growth of this cut-flower trade, within my own experience, when I say that ten years or so ago the flower-market was never opened during what we call the dull season, i.e., from August 1 to April 1, on the bye-days, Mondays, Wednesdays, and Fridays. What little cut-trade there was to do on those days during the winter months was done on the old market-stands, letter H. The inconvenience from want of space necessitated its removal: 1st, into a covered roadway adjoining the flower-market, and finally into a portion of the flower-market itself. The space

allotted to this business has had to be enlarged from time to time, till now about one-third of the market is used for it; and if it continues to grow, it is only a question of time how soon it may be desirable to open the whole flower-market daily for morning market all the year round.

In speaking of the cut-flower trade, I must not overlook the out-of-door farming flower-grower, whose acres of Wallflowers, Daffodils, Violets, Pinks, Stocks, Roses, Dahlias, and Chrysanthemums, are marketed at times in such abundance, often in the open general market. I have seen waggon-loads of these goods, sometimes packed in bundles, loose, often in large rounds or hampers, scenting the very air with their fragrance for yards around. These are not unworthy casts-off, but admirably grown blooms. I have known cartloads of Stocks, e.g., fine double-bloomed heads often fit for exhibition in a flower show. Double white Daffodils, this spring, I have known as many as 800 bushels, each containing four dozen bunches, sold by one man in a single morning before 9 o'clock, without fuss or bother. Violets in bunches, six small bunches in a market bunch. I have, a few years ago, known as much as £50 or £60 worth sold by one man on a single morning. These were grown under Apple trees. Roses are not so largely grown, but their cultivation is increasing. Moss Roses, Monthly Roses, General Jacqueminot, and Gloire de Dijon are the chief varieties. Bunches of mixed flowers, ready tied up, are greatly sold in the autumn, and amongst these the Dahlia is conspicuous.

New Varieties.

Perhaps nothing is more speculative and certainly nothing more profitable, than the introduction of a new and popular variety of flower, say Carnation, Chrysanthemum, or Rose. But the public are very exacting in these respects, and demand an attractive size, colour, or scent, while the grower requires it to possess a constitution, habit, and vitality sufficienty to stand the test of continued forcing without deterioration of quality. Perhaps one of the latest examples of success in this line is the Carnation Uriah Pike, one grower of which has at present a daily average cutting of 200 dozen blooms, which he hopes to increase.

I think I have rambled pretty well amongst the cut blooms. I see my friend Mr. Monro here, who without doubt, is the largest cut flower commission salesman in the world, and who probably could have given you a paper on this subject more interesting than myself. Certainly his knowledge of where they come from, and go to, is based on a very long and wide experience, and a list of the addresses to which he sends a weekly cheque would doubtless surprise us all. I suppose the effects of our cut flower and plant trade reaches even beyond the things themselves.

Look at the bulbs and seeds we grow and import—Holland, Germany, Japan, East and West Indies, the colonies, every quarter of the globe sends us roots and seeds. One little feature of our home trade must not be forgotten. I mean the humble moss, Fern, and ornamental foliage and grass so useful and increasingly sought for. Winter and summer, spring and autumn, each season sends us its representatives. The tinted sprigs from the early hedgerows, the Primroses, Ivies, and moss of woodland dells, the brown and yellow autumn-tinted leaves, the berries of Hawthorn and wild Dog Rose, nothing of beauty in Nature is too insignificant for London supply. I think I cannot better conclude my observations than by adding up a morning's items somewhat after the fashion of a market buyer or salesman.

One morning this May—item 268 large van-loads, 114 small loads or barrows of boxes, 370 stands, with every available shelf packed to overflowing; gangways blocked, corners used, out space crammed full; about 300 sellers. Here is a bill for the mathematical inquirer. How many buyers? How many horses and vehicles to take them away? What value? How many acres of glass? How many miles of houses? How many miles of piping? How many tons of fuel? How many casts of pots? How many hands employed to plant, tie, water, cut, and pack them? What capital invested in the trade of the producers only? Say nothing of the shops of the tradesman, or the living of the coster or flower girl who sells, verily the subject of our varied, continuous, and increasing Covent Garden flower supply is worthy the pen of a Thackeray or a Dickens."

Mr. Archer and Mr. G. Monro produced on the table specimens of plants and flowers kindly lent by market growers. These were selected from ordinary market produce on the morning, and not specially provided.

New or Noteworthy Plants.

Lælia tenebrosa var. Pittiana,

new var.

This beautiful novelty is, in its way, as distinct and as handsome as L. tenebrosa, Walton Grange variety, illustrated in the *Gardeners' Chronicle*, August 19, 1893, and for which a bid of 160 guineas was lately refused by its owner, W. Thompson, Esq.

The present variety has flowers 8 inches across the lower sepals, and is in every respect in form equal to the very best of the type. The sepals are shining greenish-yellow, tinged and veined on their face with purple. The petals are of the same colour, but tinged with purple on the reverse side, except a band of greenish-yellow up the middle. The lip white with bright crimson lines connected by a shade of mauve in the centre, the colour scarcely extending beyond the tube formed by the side lobes. Thus, the whole of the front of the lip to the extent of an inch and a half from the tip is white, with only a faint blush of colour where it joins the purple of the tube. The base of the lip is also white. The whole flower is beautiful, and quite novel in its variation. It flowered in the collection of H. T. Pitt, Esq., Rosslyn, Stoke Newington. *James O'Brien.*

Kew Notes.

Lathyrus splendens.—Flowers of this beautiful plant have lately been sent to Kew for determination by several English correspondents who were anxious to know its history. It was discovered in Southern California about seventeen years ago, and described by Dr. Kellogg in the *Proceedings of the Californian Academy of Science*, vol. vii. (1877) as a perennial climber, with quadrangular stems, 6 to 10 feet long, pinnate leaves, and stout axillary peduncles, bearing from seven to ten flowers, very large, scarlet-purple, the standard an inch across, the keel an inch long, and the wings a little shorter. Pods 3 inches long, flat, ten to twenty-seeded, brown, the seeds half as large as those of the common Pea. The stems creep over bushes, and when covered with a wealth of brilliantly gay scarlet-purple flowers, the plant looks like a grand flowering shrub a little distance off. The leaflets vary considerably even on the same plant, some being linear, whilst others are ovate. There is also some variety in the colour of the flowers, some being bright scarlet, others purple. A plant which produces stout racemes, bearing each nine flowers nearly as large as those of Erythrina crista-galli, and of the richest carmine-purple colour, is worth looking after. In America it is known as the Pride of California; and Mr. Orcutt, writing in *Garden and Forest*, says that it is "one of those plants which seem to be benefited by the ordeal of fire, which renders the Vine more prolific, and adds brilliancy to the blossoms." There is no Lathyrus in cultivation like it, all the large-flowered species having only two or three flowers on a raceme. I do not know enough about it to be able to say if it is likely to be hardy in England; but whatever treatment it may receive, it is eminently a plant to be looked after. *W. W.*

Plagianthus Lyallii.

This beautiful white-flowered New Zealand shrub is now flowering freely against a south-east wall at Kew, where it has stood for some years, and has not suffered in the slightest from cold in winter. It is one of the best of the New Zealand shrubs which thrive out-of-doors here. (See figure in *Gardeners' Chronicle*, August 25, 1888.)

Genista virgata

Is magnificent at Kew, bushes of enormous size being just now dense clouds of golden fragrant blossom. It thrives equally well amongst trees in a plantation, or in the rich soil of a border. Although an old plant, it is scarcely known in English horticulture. No Genista among the Kew plants is as effective, and none grow so freely. Along the path skirting the Old Deer Park, it is truly wonderful, some of the bushes being fully 12 feet high and wide. It was introduced from Madeira last century, and figured by Dr. Lindley under the name it now bears in his *Botanical Register* in 1844. It is also figured in the *Botanical Magazine*, t. 2265, under the name of Spartium virgatum. *W. W.*

Oxford Botanic Gardens.

These gardens looked remarkably fresh and bright on June 9 this year. Not having visited them for some years, it was pleasing to find them in such good condition, with visible signs of improvement in various directions, and good order and high-keeping everywhere apparent. A fine group of new and useful glasshouses recently finished, was well furnished with stove and greenhouse, and succulent plants. Ferns, Orchids, and aquatics were also well represented. The Victoria tank was chiefly furnished with a good collection of Nymphæas, several of which being in beautiful blossom, and other water plants, the side shelves being well furnished with Coleus, Hedychiums, Anthuriums, &c. The Palm-house was well-furnished, varied with Bananas, and flowering and variegated-leaved Begonias; among the latter it was pleasing to note several of the old Rex section. The Orchids were fringed with Panicum variegatum, Gloxinias, Dracænas, Tradescantia discolor, and skilfully mixed with Caladiums, Marantas, Anthuriums, Acalyphas, Rhododendron fragrans, Strobilanthes, &c.

This fine block of houses is connected with a lofty corridor running off one end of them, one side of which is formed by the wall, and the other by the ends and doors of the houses. This practical and handy disposition of houses and connecting corridor is a repeat of the arrangement employed in the Cambridge Botanic Garden. At Oxford the corridor is planted with climbers, the narrow border on either side being fronted with a row of Streptocarpus seedlings in great variety, which have a striking effect. Between these and the climbers on each side an occasional plant of the more choice variegated Coleus adds greatly to the effect. There is also inserted between the proper climbers a thin sprinkling of Fuchsias, which will add considerably to the grace and glow of this corridor as time passes over them. *D. T. F.*

Orchid Notes and Gleanings.

Miltonia spectabilis.

These plants require to be grown at the cool end of the East Indian-house, and should be placed in hanging baskets, so that they may be well exposed to the full light; they require to be shaded from the sun during the hotter part of the day, but only a thin shading material should be provided. They require during the summer season an abundant supply of water, and the atmosphere must also be kept well charged with moisture, but after they have finished their growth, and the flowering season is past, they should be removed to the Cattleya-house or to some position where they may be cooler, and kept comparatively dry. For soil use good brown peat-fibre, from which all the fine portion has been beaten, mixed with about an equal part of sphagnum moss, surfacing with the fresh picked living points, which grow and make a nice appearance and a soft bed for

the young roots to work into. The best time to re-surface or to re-pot them is in the early spring, just as the plants show signs of starting into fresh growth. *Orchid Album*, vol. xi., part 123.

MAXILLARIA VENUSTA.

This is a strong-growing but dwarf plant, producing stout bright green leaves, and flowers of a large size, which frequently measure some 5 or 6 inches across; these are thick and fleshy in texture, of the purest white, saving the lip, which is yellow, blotched with dark purplish crimson. Its usual flowering season is during the autumn and winter months, but it will continue flowering during the whole summer, when the plant becomes thoroughly established, bearing a score or more of its pure milky-white flowers, and presenting, as some of our patrons have reported to us, a noble appearance. The plant comes from an altitude of 5,000 or 6,000 feet, and consequently requires to be grown in the coolest house, kept in a moist position, and in the shade. It enjoys an abundant supply of water, therefore it should be well and carefully drained. We like pot-culture for this plant best, and we find that it likes firm potting, using for soil good brown upland peat-fibre mixed with some chopped sphagnum moss. It likes to be kept moist all the year through, and a larger supply of water should be given during the summer; do not, however, by any means stop the supply even in the winter season, but let it have enough to keep bulbs and leaves in a healthy condition. *Orchid Album*, vol. xi., part 123.

DENDROBIUM DEVONIANUM.

That this fine Orchid is capable of producing pseudobulbs, 4 feet long, I had an opportunity of witnessing at Mr. Bolton's, near Newchurch, Yorkshire. The plant was growing in a basket amongst a miscellaneous collection of plants suspended from the glass, evidently enjoying the moist warmth which suits tropical plants. It had been grown from a comparatively small imported piece, and the past season's growth had exceeded the previous one by at least 18 inches in length of pseudobulb. An extraordinary profusion of large flowers adorned the plants on one or two stems, there being eighty-four flowers. *A.*

WELLHEAD, HALIFAX.

WELLHEAD, the residence of Mrs. Doherty Waterhouse, has been for fully fifty years a place well-known for good plant culture. The late John Waterhouse, the former proprietor, was a collector of choice herbaceous and exotic plants of all kinds, and for many years Halifax was noted for the excellent stove and greenhouse plants grown and exhibited in the district.

Against the back wall of a large lean-to stove at Wellhead there is a plant of the night-blooming Cactus, Cereus grandiflorus, occupying a space 18 feet long by 10 feet in width, which blooms freely every year, and is just now producing a good quantity of flowers. It is planted out in a shallow bed in a raised position at 3 feet from the floor, and but for the fact that its roots are confined to the space mentioned the whole of the back wall would have been covered by its stems long since, for it has been nearly fifty years in its present position. By its side is a plant of Monstera deliciosa, about as old, which is 15 feet high. It has long since reached the top of the wall, and has now to be confined to the space which it has occupied for these many years past. In this large stove a superb lot of fine specimen Pancratiums of a large size are flowering freely.

In the large Camellia-house on the shady side are five extra large glass cases devoted to filmy Ferns, including a fine Todea superba, in perfect health, 3 feet through; vigorous masses of Hymenophyllum radicans and H. Tunbridgense.

A long narrow lean-to house, 60 feet long, sunk in the ground, and formerly devoted to Cucumber and Melon growing, is now used as a Fig-house, with sixteen large plants in pots, the other four planted out, and these have been cultivated here for many years. These in pots are partially sunk in the raised bed, and all are in luxuriant health, closely pruned and tied in, and have not been repotted for five years, but are kept well fed, and each shoot is stopped at the fifth leaf, and the plants are bearing profusely. A better lot of Figs it would not be easy to find, and the entire house is devoted to them.

Gardening in Halifax is carried on in the face of very great difficulties, as everyone acquainted with Halifax knows; for instance, the only variety of Strawberry which will exist in the Wellhead Gardens is the old Cuthill's Black Prince, and this does best when allowed to grow in a mass. Rhododendrons of the hardiest kinds are the principal evergreen shrubs grown in Halifax, and these do well; but any with a tender breed in them soon succumb.

Mr. George Wheatley, for seventeen years gardener here, and for as many years previously at the Hope Hall Gardens, has for the whole of that period enjoyed the well-earned reputation of a good practical gardener and first-class plant-grower, and in the old exhibition days was a very formidable competitor. Two span-roofed stoves in the Wellhead Gardens are alone worth seeing. Around each side and in the centre are stages on which the stone flags, so plentiful in this district, were placed, and on this a surface of ground sandstone was placed, on which various variegated and other stove plants were placed, and are replaced as necessary; and the green and variegated Panicum, planted in the sandstone along the edge throughout the house, and the smaller-growing Marantas and other plants, also planted amongst the Panicum, the latter forming a luxuriant fringe, falling almost to the floor, and making a filling amongst the plants. I have never seen two more exquisitely-arranged stoves, and with Coleus, Crotons, and various stove plants in flower, masses of Selaginella and other small-growing subjects, the arrangement showed how simply and effectively a stove may be made beautiful, and so easily kept up; and Stephanotis, Gloriosa superba, Allamandas, and other creepers were growing over the roof. *W. W.*

FLORISTS' FLOWERS.

THE GLOXINIA.

It may be difficult to determine which of these very popular greenhouse plants, the Gloxinia and Begonia, have, in the process of evolution, made the most rapid strides in improvement, but it may at least be said of both that, though a little outside of the range of ordinarily accepted florists' flowers, yet with each the development from inferior forms to almost ideal ones has been rapid beyond all precedent; whilst the Gloxinia has perhaps, so far, the nearest approach to the florists' ideal in colours, markings, and in outlines. How few are the years after all that have elapsed since the comparatively small and commonly drooping flowered forms were the best, and then held in high esteem! Not the most sanguine of florists could then have realised what would be the form and colouring of the flowers of to-day. The pendulous habit—very graceful it was, no doubt—has disappeared; every flower is now boldly erect, not that this boldness is a fault, far from it, for by it we have seen the conversion from semi-flattened flowers, with extended line, into those of the greatest size, most perfect roundity, and even lace or margin and colouring so varied, so beautiful, as to defy description literally. A well-grown Gloxinia to-day, carrying from twenty to thirty fully-expanded blooms, each one of the most perfect contour, standing erect on stout stems, and set in a nest of almost noble leafage is indeed a beautiful object, and such objects are now common enough in nurseries and gardens everywhere. Whilst some tastes favour the pure whites or the brilliant crimsons, others like the bold broad-edged flowers, some the not less striking blotched ones, and others again those that are so exquisitely netted or speckled. The true lover of flowers, however, who has no fads, loves and appreciates them all, for all are indeed lovely. It is only those who gardened half-a-century since, who can fully realise the immense wealth in floral beauty gardeners now enjoy in the possession of the glorious Gloxinia. *A. P.*

CHISWICK NOTES.

PINKS AT THE ROYAL HORTICULTURAL SOCIETY'S GARDEN.—The collection of Pinks forming the trials of this fragrant flower grown at Chiswick were inspected by the Floral Committee on the 29th ult., and despite the intense heat and dryness of the atmosphere there was a remarkably good head of bloom. All the varieties examined, and they included many of the florists' laced varieties, were judged simply from the point of view as effective border flowers. Compact in growth, erect, free-flowering, and displaying their flowers to the best advantage: it may be stated that a considerable proportion of the florists' laced varieties make good border flowers, but by reason of their size and the fulness of the blossoms, and their producing several on a stem, the latter is borne down by the weight, and the flowers lay prostrate on the ground, unless tied up. This is a fate which also befalls some of the large-flowered border varieties, and it is inevitable, from the wealth of bloom the plants yield.

To the following laced varieties three marks were given, equivalent to an Award of Merit:—Beauty, a red-laced variety, good in quality, very free and effective on a border; Rosy Morn, red disked, purple laced, a large, full, and showy variety; and Empress of India, one of the best of the dark laced Pinks, and a good exhibition variety. The award made to Modesty, one of the earliest of the border varieties to flower, and remarkably free, and also to Mrs. Dark, in previous years, were confirmed.

As it is sometimes stated, the laced varieties are deficient in constitutional vigour, it should be remarked that at Chiswick, as well as elsewhere, the laced Pinks show as great degree of hardihood as the border varieties. When laced Pinks were propagated as pipings on warm dung-beds under hand-lights, they did for a time—that is, until they were rooted, have the advantage of glass, but now that layering is resorted to as a method of propagation they are wholly grown in the open, and at Slough, Bath, Birmingham, Cardiff, and other places, they are exposed to all the rigours of winter, and stand exposure with immunity from injury; and as this is the general experience of cultivators, the fact should be stated. It should also be borne in mind that those who grow Pinks for exhibition, plant them in the autumn in beds in the open air, as this is a necessary condition of having large, full, well-laced flowers; and it may be added that, despite the great heat and dryness, such fine laced Pinks as Bouard, Bertram, Device, and others, produced fine-coloured and laced blooms, although the plants were unshaded.

The border varieties, as growing at Chiswick, need arranging into two groups—one represented by the dense-habited, small-flowered, early varieties, which produce enormous quantities of blossoms, mainly one flower on a stem, which are generally dwarf and compact in growth, with stiff erect foot-stalks; and the later, large-flowered varieties, such as Her Majesty, Snowflake, Ernest Ladhams, &c. The latter do not form such dense masses of foliage, nor do they produce a number of flowers on a stem; they are also later in flowering.

Of the first section, which mainly consists of the Bedford seedlings, three marks were given to Charmer (Dean), pale pink, with slight rose centre; Rosamond (Dean), pale pink, with bright crimson centre; Juno (Dean), white, with deep rose centre; Beauty (Dean), white, with bright rose centre; Annie Bolton (Dean), white, with maroon centre, perhaps the finest of all; and Rosy Circle (Dean), deep pink, or pale rose with a deep rose centre. All the foregoing early varieties have fringed edges, the flowers are full though small, they rarely burst their "pod," and they are invaluable for cutting and bunching. They serve another purpose, during

winter the plants form dense masses of shoots, in this respect resembling the Alpine types, and it is this characteristic which makes them so floriferous.

Of the later and larger-flowered varieties, three marks were awarded to Cowley White (Lakin), a very good white indeed, with concave smooth-edged petals, dwarf, and very free, a good companion to Mrs. Lakin, by the same raiser, which was also remarked in excellent character; to Ernest Ladhams (Ladhams), of a soft pink tint, with a dark centre, compact habit, erect, and very free; and to Souvenir de Sale, pale pink, very free, and excellent for cutting. Her Majesty may be noted as the finest of the white Pinks of the Mrs. Sinkin's type; and Snowflake, with its large smooth white petals, is also very good. *R. D.*

is the commencement of a new type which will in time lead to a wonderful and great addition to the many varieties already in cultivation.

ANTS AS GARDENERS.

The *Annales Agronomiques* for May 25 gives an account by M. Alf. Moeller of the gardening operations of certain species of South American ants. The author says:—"That ants should cultivate plants for the sake of gaining nourishment seems truly impossible, and except for the names of responsible writers and of the author, himself experienced in subjects connected with the Tropics, I should not venture to say a single word in this paper on so astonishing a subject. It has long been known that ants, those excellent architects, are often, as Huber said, herdsmen, and raise carefully in their ant-hills, or in the neighbourhood, aphides, which furnish them with a sugary liquid, of which they are very fond. 'The aphis is the cow of the ant,' says the careful Linnæus. It now appears that the wonderful picture of ant-life was incomplete.

"In a well-known work, *The Naturalist in Nicaragua*, Thomas Belt, to whom science owes the discovery of myrmecophilous plants, has described the life and habits of leaf-cutting ants, well-known to all who travel in Tropical America, which move in innumerable troops, each individual bearing a scrap of leaf towards the nests, where they disappear with their spoil. He was not able to prove by ocular experience the use that these interesting creatures make of the pieces of leaf, but having destroyed a certain number of nests, he was able to offer a hypothesis which was not at first very well received in the scientific world—that ants cultivate on the leaves a fungus on which they feed.

"M. Moeller, who lived in South Brazil for three years, tried to verify Belt's hypothesis; not only did he succeed in confirming the truth of the facts observed, but he was so fortunate as to make various new discoveries. He observed at Santa Catharina four different species of leaf-cutting ants—Atta discifera, hystrix, coronata, and also a new species which he distinguished by the name of Atta IV. We have not time to follow these insects cutting the leaves and bearing them along the roads made for the purpose, and maintained with the greatest care by workmen charged with that office. It is interesting, from a philosophical point of view, to note that the little republic fares well, as each individual does his duty without interfering with that of his neighbour. The ants are not capable of intelligently uniting their efforts on any given task.

"Already had Belt shown that leaf-cutting ants affect certain species of plants; that is not all. They ravage now this, then that one, often neglecting those which would be most easily accessible to them. It might be said that they seek to combine for their fungi a special substratum, which varies from time to time. Occasionally the nests of Atta are openly constructed on the ground of the forest, and then covered with a thick layer of dried leaves and twigs; they are oftener found in holes sunk in the earth, or in the trunks of rotten trees. The cells of which they are composed contain small heaps of a substance coarsely porous like sponge, in the middle of which

Fig. 1.—CLEMATIS, COUNTESS OF ONSLOW = C. STAR OF INDIA × C. COCCINEA.

CLEMATIS, COUNTESS OF ONSLOW.

This remarkable and pretty cross-bred Clematis was shown by Messrs. George Jackman & Son, Woking, at the last meeting of the Royal Horticultural Society. In a communication received from the exhibitors they say that it is quite a new departure from anything previously introduced, and has been obtained by crossing C. Star of India and C. coccinea, the former being the parent-plant; the flowers are trumpet-shaped, and very rich reddish-purple in colour, the foliage resembling C. coccinea in size and form; it is a strong grower, very hardy, and a free bloomer.

We feel sure there is a great future before it, on account of its distinctiveness and good qualities, and

the ants congregate in great numbers with their eggs, larvæ, and cocoons. These masses are the 'gardens;' this garden never touches the partitions nor the ceilings of the cells, from which a space the breadth of a finger always separates them.

"The garden generally consists of two distinct parts; one, the more recent, blackish-blue in colour; the other, older, is red-orange. The first is the more precious, doubtless, for if the nest is destroyed, the ants work first of all to place this in safety. When more closely examined, it is seen that the garden is composed of small grains about a fiftieth of an inch (half a millimètre) thick, at first green, which after turn darker, nearly black, and finally orange. We see how these little masses have been prepared with leaves. The whole garden is traversed in every direction by the threads of fungi, and on these the small tubercular excrescences, which the author jestingly calls 'Kohl-rabi,' are raised.

"The 'Kohl-rabi' in question is the principal if not exclusive nourishment of the Atta. There is no more in the old parts of the garden. It is the result simply of a spherical swelling at the extremity of the threads, and full of a frothy protoplasm. Upon emptying the contents of a nest, inhabitants included, into a glass jar, the ants are at once seen to recommence making their garden; all the materials strange to the garden are heaped along the sides of the jar, which becomes in consequence opaque; in the centre the spongy mass, typical of the garden, is soon seen to appear. On the succeeding days the walls increase in thickness, while the garden diminishes in width, and finally disappears; then the ants are seen to run anxiously about in this empty space, and to perish at the end of eight or fifteen days. While the garden remains, the death of an ant is a rare occurrence. The author had the idea of leaving the ants to fast, giving them only Rose-leaves, which, as a rule, they did not touch; then he offered them fragments of a garden emptied of its inhabitants. After a little practice he was able to directly feed the ants on 'Kohl-rabi,' but on that which had been raised by other species of Atta. The same ants rejected, on the contrary, the 'Kohl-rabi' raised by other genera of ants, of which several exist, as well as all other fungi. It was seen at the same time how ants set to work to prepare the garden. Not only the fragments of leaves brought are again cut up, but are so triturated that all the cells are torn.

"All gardens cultivated by Atta which have been noted contain only one and the same fungus—that which produces the 'Kohl-rabi.' Never while the ants have it does the mycelium appear in the open air; never does it develop any form of fructification. Two conidian forms are easily obtained when the ants are removed. The mycelium has a tendency to form swellings, the vesicular processes very distinct one from the other; the one of these productions, the result of cultivation, is the "Kohl-rabi." The author was able to obtain this by artificial cultivation in the midst of a nutritive solution, and this artificial Kohl-rabi was willingly accepted by the ants. He also discovered the fruit of the fungus, which is an Agaric, and which he calls Rozites gongylophora; it has a cap covered with red or black-purple scales, with brown spores, and a double volva." *Vesque.*

A TRAVELLER'S NOTES.

(*Continued from vol. xv., p.* 781.)

Adelaide, S. Australia, *April* 11.—The Museum of Economic Botany next claims attention. It has the reputation of being one of the best in Australasia. Oblong in shape, it is constructed of freestone, at a cost of £3,000. The approach, by open lawns, on which are isolated specimens of the various Agaves, Phœnix, Chamærops, that handsomest of Pines, P. longifolia, Juniperus bermudiana, and a gigantic South Australian native tree, Eucalyptus rostrata, with a trunk 7 feet in diameter, is good. To the right is an avenue of Araucaria Cunninghami and A. excelsa, alternately planted, good regular specimens 25 to 30 feet high. At one end is the largest specimen of Pinus halepensis in the garden, a noble specimen, some 90 feet high (unfortunately with a divided trunk); behind it a row of Pinus insignis forms a fine solid belt.

The centre of the Museum is occupied by long glass cases; jutting out from the walls are high narrow ones, others filling the recesses thus formed. A collection of fruits, made from a composition of *papier maché* and plaster of Paris, by a German firm, in many instances most life-like, is comprehensive, whilst one made in the Colony shows the extraordinary size and colour obtainable from South Australian soil. Mr. Holtze assures me they are not at all exaggerated, and from what I have seen I do not doubt it. Grapes, represented by bunches of 9 to 10 and occasionally 13 lb., Zante Currant bunches, 1 to 1½ lb., Apples as large as any we obtain in England, and Pomegranates, again as large as these, are included in this fine collection. Cherries, Plums, Figs, &c., are good, the weakest point being Tomatos. That the specimens copied were selected for their size is possible, nevertheless it is a sure testimony to the capabilities of the Colony in this direction.

Mr. Holtze finds, as I have generally done, that the flavour of colonial-grown fruit is wanting when compared with European produce, probably due to the quickness of growth.

One of the best items in the Museum is a collection sent by the Japanese Government in the Jubilee Year, of seeds, oils, starches, dyes, vegetable and animal manures, fodder and agricultural products generally, &c. A case of fifty varieties of Maize, including two husk Maizes, a red and white, each seed being completely developed in a dry coriaceous husk; a case of cones, one of pitchers, a series of thirty-seven trays, illustrating the various stages in the manufacture of Wheat-flour; six cases of fibres obtained from all portions of the globe; a carpological collection, consisting of thousands of specimens; various cases of Rice and other cereals, food spices, gums, oils, barks, poison-plants, silks, the products of the Olive, Barley, and Wheat; models of fungi, Flax, tobaccos, cottons, and cocoa and chocolate in its various stages of manufacture, are among the most notable items.

Amongst the exhibits are also a piece of Oak wood "which formed part of a bridge, erected by Julius Cæsar fifty-six years before Christ, across the Rhine between Weissenthurm and Neuwied;" and paper made from Pine-wood, which when reduced to pulp, known as paper pulp, replaces rags in the manufacture of this important article.

At one end of the museum, a compartment has been specially arranged for the herbarium, containing some 18,000 specimens. Mr. Holtze hopes, however, shortly to transfer them elsewhere.

But a few yards from the museum is the Victoria Regia-house. The plant in a central tank occupying the greater portion of the low house is in good condition. Its largest leaf this season was 6 6 feet in diameter, and it has so far borne thirty flowers. In the tank, a smaller one, 12 by 8 feet, and 5 feet deep, half filled with stones, part with soil, contains the plant, the water being kept between 80° and 87°, and the necessary movement obtained by a slight stream from an overhead jet. Specimens of Acrostichum aureum, Colocasia Devonsayana, Alocasia Van Houttei and A. Portei stand round with the base of their pots in the water. The side stages are occupied by Anthuriums, Caladiums, Philodendrons, Aspidistras, and Palms, the iron pillars covered with Tree Fern roots, support Pothos aurea, the more general species of Ferns, and a few Orchids, whilst such creepers as Vanilla, have roots 10 feet long dangling in the water. Cissus discolor, Combretum grandiflorum, Clerodendrons, Hoya carnosa and H. Cumingiana, Allamanda Hendersonii, and A. Chelsonii, Aristolochia ridicula and Calonyction sanguineum are trained on the roof. In the tank containing 6 feet of water, Nymphæa capensis, scutifolia, ampla, and the very beautiful zanzibarensis are thoroughly at home.

Beyond a belt of deciduous trees containing a fine variegated Elm, and but a short distance from the museum and Victoria Regia-house is the Rose garden, extremely neat and pretty. At either end tower two Pinus insignis, conical and compact, relics of an avenue planted some thirty years since. One side is sheltered from the destructive hot winds by a belt of the same Pine, the others being equally fortunate as far as shelter goes. Noticeable at this time is the magnificent Stenocarpus sinuatus (Cunninghami), a native of East Australia. Its heads of scarlet flowers, not unlike, and certainly as large as an Ixora, render it most conspicuous. A good tree faces the Rose garden. Two large beds of China Roses, masses of flower, occupy the centre. On either side are six narrow beds, each containing a row of standards or half-standards, as occasion may require, the six rows on both sides sloping towards the centre. Festoons of Clematis, Solanums, Antigonon, &c., connect the outer row, the beds being filled with Balsams, Verbenas, Pansies, Pelargoniums, Phlox, Zinnias, &c., flowering well and freely. Tea Roses are naturally in the best condition though H.P.'s are largely represented.

At the extreme limit of the garden in this direction lies the experimental ground, now chiefly used as a nursery. I noted Tuberoses very fine. The main walk here is lined by a fine avenue of Ficus macrophylla, its chief fault as a garden plant being its enormous spread of root. Recently M. Holtze found some in the Victoria Regia tank, 60 feet from the tree, and there 2 inches in diameter. Doubtless they had been attracted by the heat and moisture.

On either side, and parallel with the avenue, are rows of Ailanthus glandulosus, Robinia, Elm, Acer, and other deciduous trees. Avenues of American Ash and Sterculia diversifolia shade other paths beyond, both of which it is necessary to cross to reach that section of the garden set apart for the natural orders. This portion consists of a series of broad circles, the beds divided by narrow strips of grass, each bed thus formed being devoted to an order. Unquestionably, this is the weak point of the garden.

Adjoining this is an arboretum, of limited extent. Pines, including ponderosa, Sabinianæ, tenuifolia from Guatemala, mitis, and muricata; Frenela Macleayana, many Oaks, including Q. ambigua, Ashes, Elms, Maples, &c., are represented by moderate-sized specimens.

A fine avenue of the Queensland Tristania conferta leads from the old exhibition-ground, past the Palm-house, a domed structure, on a broad embankment raised 7 feet above the surrounding levels. Handsome stone steps form the ascent, from the summit of which a pretty view of the grounds is obtainable. The Willows before referred to lay to the left, facing a Cedrus Deodara, Araucaria Bidwilli, and Yucca Gaiesbreghtii (guatemalensis) in flower, all good specimens. Diamond and other shaped beds form a continuous line round the top of the embankment, gay with bedding plants, amongst which is particularly striking the decorative effect of Capsicum racemigerum, the yellow, red and orange varieties, the countless quantity of narrow, long, stiff fruit, keeping in condition for months, and not attaining a greater height than 8 to 12 inches, makes it a favourite in the Adelaide Botanic Gardens.

The Palm-house, constructed by a Bremen firm, at a cost of £4000, is an oblong building, with high straight sides and a low dome, which, by-the-by, it is intended to raise. The centre is occupied by a Livistona chinensis, with a stem 42 feet high, six of which are sunk in the border. Many fine specimens of the same Palm may also be seen in the house. Alsophila excelsa, Cyathea medullaris, Hemitelia Smithii, Alsophila Cooperi, Seaforthia robusta (touching the roof), an unusually fine Pritchardia pacifica, a Kentia Forsteriana, with sixteen leaves, in addition to one unfurled, certainly not less than 25 feet to the point of highest leaf; a few Chamædorea and Phœnix form the chief contents of this house. The specimens are good, but the variety is not great. A pretty waterfall, decorated with Ferns and Asparagus, occupies one end.

Directing one's steps towards the houses in the private enclosure, a good Eucalyptus maculata, with a stem 6 feet in diameter, is passed. Unfortunately, the head is but small and irregular.

In the enclosure are ten glass-houses and three shade-houses. This is naturally to a large degree the nursery for the remaining portion of the garden. Strips of "hessian," nailed somewhat loosely on the rafters, Mr. Holtze considers the best method of shading, the movement caused by the wind resulting in a current of air beneath. Chrysanthemums from cuttings, struck the latter end of October, look well; as do seedling Cyclamen in one of the shade-houses, and Pelargoniums, Cinerarias, Primulas, Camellias, and a large batch of Poinsettias in the others. Cool Orchids, those from the Andes, Mexico, &c., are grown in a glass case, itself in one of the shade-houses. One side consists of a piece of canvas kept saturated by water from a perforated pipe running along the top; the reduction in temperature thus obtained varies from 15° to 20°. Odontoglossums, Maxillarias, Zygopetalums, Masdevallias, Lycastes, and Oncidium macranthum (the latter in particularly good condition) are thus treated.

The collection of Cacti is very complete, and contains about 500 specimens; they are grown under glass, as the cold rains have been found to harm them. The fernery contains chiefly small specimens in good condition; but the palm of excellence must certainly be given to the Orchids, a hobby of the foreman, Mr. Macdonald, on whom they reflect the greatest credit. Lælias and Cattleyas are, in general, in splendid condition, L. superbiens, elegans, and guttata, Cattleya crispa, and the commoner species being all repre-

sented by good moderate-sized specimens. The collection of Dendrobiums is equally varied and up to the mark; and amongst the Cypripediums are several large specimens of purpuratum, politum, Swanianum, Leeanum superbum, Druryi, &c. Angræcum sesquipedale has sixteen pairs of leaves, the lowest resting on the pot. A. eburneum has eleven pairs, Arachnanthe Lowii, eight; Ansellia africana, and Grammatophyllum speciosum are all that can be desired. The Phalænopsis are above the average for size, and certainly so in quality. P. Luddemanniana, P. rosea, P. Stuartiana, P. Schilleriana and P. amabilis (grandiflora) are in perfect condition.

The labels most preferred are flat, galvanised iron, painted black. The name being in white, will last three or four years when varnished. Wood labels from "Jarrah" (Eucalyptus marginata), are also in use, but difficult to get of sufficient width, this wood being very prone to warp. Deal is preferred, as it takes both the paint and the written name easier, though the label only last two years, whereas those from "Jarrah" are practically indestructible. *James H. Veitch.*

(To be continued.)

THE LAKE IN THE VICTORIA PARK, BATH.

This park has considerable historical interest, having been opened by our present Queen, when Princess Victoria, on her first and only visit to Bath in October, 1830. The site is at once charming and commanding, the soil tested by this most practical test, the free healthy growth of the rich collection of trees and shrubs the park contains, is of the very best. The park is also laid out, furnished, and kept with great judgment and taste. A good many of the trees are also legibly labelled, with their botanical and common names, their native countries, and the year of their introduction; this might be carried much further with evident advantage, alike in the park and the Botanic Gardens associated with and attached to it at one end. Not a few of the labels in the latter have become illegible; more from being of small size, and written on wood, are difficult to decipher; some are misplaced. As this garden is mostly the gift of private beneficence—the family of the late Mr. Broome, F.L.S., having given 2000 botanical specimens towards its furnishing, hence, the local name, the Broome Botanic Garden—might I suggest to the benefactors and botanists of Bath the desirability of re-labelling their valuable collection of plants with Stratford Imperishable Labels. These gardens have been so fortunate, and so much enriched by private benefactions in the past, and also in being laid out by Mr. Morris, F.L.S, with so much taste, that doubtless this much-needed improvement of re-labelling will soon be attended to. Were any further stimulus to this good, needful work necessary, it may be found in the fact that during a few hours' note-taking in the gardens on May 26, I was asked more questions about names by total strangers than at any previous period of my life. It was also most interesting as well as amusing to see and hear the Bath-chairmen doing their best to read and pronounce and explain the names to their invalid fares.

The lake is within a short distance of the Botanic Gardens, and forms a sheltered curve or semi-recess in the park. Originally it is said to have been an old quarry. The surface-springs were collected and gathered together into a pond, the transformation being chiefly, if not wholly, affected through the taste and genius of Mr. Edward Davis, the whole affording a favourable example of what may be effected in the way of landscape gardening. The lake and its surroundings, though not large, is a veritable tit bit among scenery, and surroundings of exceptional richness and beauty. Its environments are the park, with its fine lawns, trees, shrubs, roads, walks, the Botanic Gardens, meads, playfield for Bath children, &c. Water in motion, as well as at rest, can also be heard and seen. True, water at perfect rest—repose—is, as it ever ought to be, the prevailing feature in lake scenery. But the source of supply is not attempted to be hidden, but dashes down some "rocky shallows" at one end, near to the rustic bridge. Possibly these waters in motion might be extended alike in volume and area, with enhanced artistic effect.

The lake itself, smooth as a mirror, with its curved lines of beauty, sweeping in and out at every turn—here hugging the green grass, and there bathing the thirsty roots of the shrubs into a deeper verdure and higher beauty, seem to have caught and fixed the very spirit of repose in landscapes. Doubtless, a good deal of this complacent satisfaction arose from the softness and grace of the curved lines. Following these in their chaste and soothing course, one could but rest and be thankful, while recalling the following lines:—

> "Straight is the line of duty,
> Curved is the line of beauty;
> Follow the first and thou shalt see
> The line of beauty follow thee."

The chief structural drawback to the perfection of the lake is the rim of stones intervening between the water and the turf or groups of shrubs. Were the turf and the shrubs to kiss the water all round, the softness of the curves, and the skill displayed in grouping the furnishing trees and shrubs, would complete one's admiration of the lake and its surroundings.

Not only are the water and shrubs tastefully disposed, but skilfully balanced, and well proportioned one to the other. Seldom either in Nature or Art does one find such a perfect blend of silver and verdure as is here afforded by the lake and its clothing fringe of vegetation.

The overpowering grace of the specially fine Weeping Willows, the huge masses of Golden Elder, and a fine Copper Beech, and other trees, form a rich massive background, while telling groups of Berberis dulcis, specially fine Weigela rosea, Pyrus japonica, golden Geum, yellow Genistas, sweet Bays, variegated Euonymus, Yuccas, and common Gueldres Roses, are skilfully massed in the foreground of the Lake, and on the fully furnished Island. Great skill is shown in the posting and relative sizes of these groups. Seldom or never have such fine Weeping Willows been seen as several of the drooping giants found around this Lake, while the Weigelas, close to the water, with their roots possibly dipping into the lake, are pictures of health, and smothered with blossom, their long branchlets drooping down towards the silvery surface of the Lake. *D. T. F.*

THE HERBACEOUS BORDER.

SAXIFRAGA COCHLEARIS.

Among the many beautiful Saxifrages now in flower, the above I consider to be the most charming. Happily, too, it is very easy of cultivation, and extremely free in its flowering. It is a variety of S. ligulata, consequently belongs to the crustaceous section of this family. The plant is disposed in tufted rosettes of spatulate leaves, the rosettes being very closely packed together. The snow-white flowers are produced in graceful and slender panicles, and display themselves to much advantage against the purple-red of the branches and peduncles. Though deserving of general cultivation by reason of its exceptional qualities, I fear it is as yet not well known. When once obtained, however, it can soon be increased, as it grows, flowers and seeds freely. According to the *Dictionary of Gardening*, it was introduced from the Maritime Alps in 1883, but I have grown the plant for more than twenty years. Despite the heavy and almost incessant rain, it was in full beauty on June 11. The plant can be well grown in such a compost as would be good for a Fuchsia. Planted freely on a rockery the results would be charming. *J.*

Veronica apicaula.

This is a charming variety of the Speedwell family, and is a conspicuous plant in the present month in herbaceous borders. The numerous flower-spikes it produces are of a feathery kind, and pale blue in colour, about 1½ feet high. The plant is increased by division of the roots, and cuttings in early spring. The plant does well in light, fertile soil, in spots distant from the shade of trees, &c. *W. W.*

Erigeron philadelphicus.

The above species is regarded by many persons as a most useful one for producing flowers from the month of May onwards till August, for these flowers have many uses for indoors decoration, looking well when associated with grasses and flowers of shades of colour different from its own. The habit of growth is somewhat like that of a miniature Aster, in height from 1 to 1½ feet, the several growths being surmounted by beautiful pink flowers about ¾ of an inch in diameter, and finely divided florets, with a bold yellow disc. The plant grows best in light, moist, but well-drained soil, and it is easily propagated by dividing the roots in the spring. *W.*

Betonica grandiflora.

The above is an attractive plant in the borders in May and June, and the blooms are very effective when cut. The spikes consist of closely-set flowers of a deep violet colour. The plant has freedom of growth and flowering, flourishing in any light and fairly fertile soil in a situation that is open. The average height is 1½ foot. It is increased by division of the roots early in the spring. Everybody having a patch of border or front garden should grow this plant. *H. W. Ward.*

The Creeping Forget me-Not, Omphalodes verna.

The above plant is one of the most lovely of the flowers of spring, the flowers a deep and clear blue colour with white in the throat. On our light soil at Lythe Hill, Haslemere, we have nothing else so good for shady borders or for naturalisation in the woods under trees; beneath Rhododendrons, &c., in such places it seems quite at home. When grown on the fringe of a grassy lawn and contrasted with the common Primrose, it is excellent; but the best effect I have observed was large masses of Valeriana Phu aurea, edged with a broad margin of Omphalodes, 18 inches in width. The Valeriana is much the brightest plant, having yellow foliage, for spring gardening; and it is indispensable in the rock garden, and in shady and out-of-the-way places where other things usually fail to give satisfaction. *A. Evans, Lythe Hill.*

THE NEW PARK AT CARDIFF.

Cardiff is one of the most progressive of provincial towns, and it would have been surprising had its Council allowed anything but success to attend the conversion of about 120 acres of land at Roath, in the eastern end of the town into a public park for the enjoyment and education of the people.

Previous to 1887 a desire to secure land for the purpose of a park in this rapidly-extending suburb had been felt, and in 1882 a committee of the Council entered into negociations with Lord Tredegar with a view to acquiring about 40 acres, which it was then thought would be required; but the scheme fell through as the Council felt themselves not justified in spending so much as £18,500, the sum asked. Overtures were then made to Lord Bute, and it appeared as if these also would be unsuccessful, when, in 1887, an offer was made to the Council, that, providing Lord Tredegar and other owners of small pieces of land embraced in the scheme, would give the same to the town free of cost, it was Lord Bute's intention to make arrangements with his trustees to purchase the necessary Bute lands—about 80 acres—and present them to the town as a site for a park for the people. The offer was gladly taken up, and no difficulty was experienced in obtaining from the owners the land that bisected the gift of the Marquis. The first sod was cut in August, 1887, by the Marchioness of Bute, amid general rejoicings, and the park was formally opened to the public by the Earl of Dumfries about a fortnight ago.

The conversion of the land has entailed an un-

usual amount of work in road-making, draining, and levelling. This has been carried out by contractors, under the superintendence of the Borough Engineer, and many difficulties presented by the physical character of the situation have been mastered in a praiseworthy manner. The face of the park, however, has been produced, and all the horticultural work done by labour employed by the Council, and under the direction of Mr. W. W. Pettigrew, Superintendent of the Parks and Open Spaces, and son of Mr. Andrew Pettigrew, the excellent gardener at Cardiff Castle. The total cost of making the park was about £55,000, and the area measures 120 acres, but the peculiar shape of the site is such that its length is nearly 2 miles. The land is intersected by roads, which divide the park into five sections, and it has been found convenient to keep the recreation grounds in this manner quite separate from other portions, the botanic garden, and other divisions being treated similarly.

A small watercourse, known as the Roath brook, runs through the site, and although it has caused a great deal of trouble to the contractors through its liability to excessive flooding — a habit especially common to the brooks and rivers in Wales—it has, nevertheless, afforded the means which have been used to produce several of the finest features in the park. By the construction of a dam, a magnificent lake has been formed about half a mile long, varying in width from 140 to 225 yards. The area of the water surface is 30 acres, being about equal to the Serpentine in Hyde Park.

The next section adjoining that containing the lake has been laid out as a botanical garden, and one of the interesting features of this will be the bog-garden. The section next to the botanical garden on the town side is devoted to pleasure-ground, and the brook, which runs through all the sections, has here been divided for the purpose of forming several small islands. At points also the brook has been widened to prevent liability of flooding. The recreation-ground follows, and in this section the stream has been diverted and all the space possible will be devoted to summer and winter games. About 13 acres lying furthest from the town, and intended as an additional pleasure-ground site, have not yet been taken in hand.

At present, only one greenhouse has been built, and that merely for raising and keeping plants for the botanic and flower gardens; but from what we know of the ambition and of the progressive spirit of Cardiff, we shall expect to see a good winter garden and a thorough educational botanic garden find a home in the park at Roath at a future time. Should this desirable consummation be realised, the Council have in Mr. Pettigrew a man well suited to develop and maintain the educational facilities such an institution is the means of affording. The position of the park in regard to the town is a good one, remembering that this district is becoming more and more built upon, and the largest of the other open spaces is in the opposite end of the town. Cardiff is now very well off in respect to pleasure ground and park provision, and its energies in this way must now be devoted to improving the park at Roath by making the additions above suggested.

The Apiary.

ANTS IN HIVES.

Complaints are frequently made of ants getting into hives, and although these little insects can scarcely be classed in the list of enemies of bees, it is best to take measures to get rid of them. Bees will wage war on ants if they persist in keeping them company, but may not be able to exterminate them, through their ability, on account of their smaller size, to take up their abode in parts of the hive to which the bees have not access, as, for instance, between double walls or about the hive coverings. It has been thought by some that ants are attracted to hives by the honey and wax, and the prospect of having a well-filled larder always at hand; but as a fact it has been observed that they have exercised a preference for hives with colonies of bees in them over those standing by the side, and containing only combs filled with honey. This would seem to show that it is the warmth from the bees that they most appreciate. Ants can be prevented from entering hives by standing the hive legs on stones placed in pans of water; and if they are already located therein they can soon be made to take their departure by inserting a few pieces of naphthaline, the smell of which they dislike. If ants' nests exist about the apiary, the ants may be made to forsake them, and go elsewhere by sprinkling powdered borax about the hills.

Toads.

Toads are now on the look-out for bees, and may frequently be found underneath alighting-boards on the watch for their unsuspecting prey. Needless to say, they should be got rid of, and the ground about the hives kept clear, so that there is no harbour for them. In places where toads are numerous, it will be advisable to stand hives so that the alighting-boards are 1 foot or 18 inches from the ground, as otherwise they will be able to get on to them, and will sometimes be found comfortably seated at the hive entrance.

Self Hivers.

A trial of self-hivers this year of different designs, on half-a-dozen hives, has caused the writer to come to the conclusion that these apparatus may really be used to prevent swarming. The reason appears to be that self-hivers act as drone-traps, and as it is not natural for a colony to send forth swarms without drones to fertilise the young queens, swarming may not be expected to take place. Therefore, if swarms are to be intercepted by self-hivers, they must not be put on the hives until the bees have got the swarming fever, and started queen cells; and on the other hand, if the problem of the prevention of swarming is solved by the self-hiver, it will be a highly useful development. *Expert.*

The Week's Work.

THE FLOWER GARDEN.

By John Lambert, *Gardener, Powis Castle, Welshpool.*

HARDY HEATHS.—Beds and specimens of these on lawns or in shrubberies, where required to be kept of low stature, as is the case generally when planted in beds or scrolls, may, as soon as the flowering period is over, be cut to a uniform level with the hedging-shears; and in the case of specimens, doing the needful pruning with the knife, that is cutting out straggling shoots, so as to give the plant a somewhat regular although not formal shape. The propagation of the hardy species of Heaths is usually effected by division in the spring or autumn, yet where it is contemplated to plant beds, and especially those of a set design, plants raised from cuttings will be found to be best for the purpose. The present is a good time for striking them. In taking cuttings choose the firmest young growths, and with a slight heel attached. The best compost in which to strike them is a mixture of hard peat, fine charcoal, and sufficient sand to prevent any chance of souring or adhesiveness; as cutting-pots, 6-inch ones will be found well suited, and in filling them, one-half in depth at least should be given up to drainage. Over the crocks put a layer of roughish peat, then sufficient of the compost given above, passed through a $\frac{3}{8}$-inch sieve, and as will reach to within $\frac{3}{4}$ of an inch of the rim, the remainder consisting of clean silver-sand. Press the material firmly, and water, after which the cuttings may be dibbled-in, care being taken that the leaves of the cuttings rest on the soil, and are made firm down to the bottom of the hole. They should then receive a sprinkling through a fine rose-can, placed under bell-glasses or in a close frame, and shaded from the sun.

PANSIES AND VIOLAS.—Cuttings may now be taken to furnish plants for next year's spring bedding. Choose stout short-jointed shoots without flowers if possible, and of about $2\frac{1}{2}$ inches in length, carefully labelling the different varieties. A shady border will suit them, if plenty of sand, leaf soil, and spent mushroom-bed manure be used in preparing the soil if it be heavy. If hand lights can be spared to place over them the cuttings will strike all the sooner, and failing these, good attention must be given them to try and prevent their flagging too much; keep all flowers pinched off them till well rooted.

THE HARDY FRUIT GARDEN.

By T. Turton, *Gardener, Maiden Erlegh, Reading.*

PROTECTING THE FRUIT OF THE GOOSEBERRY.—The bushes should now be netted without delay, and where a good proportion of Red Warrington and other late varieties are grown, any labour which may be incurred in this way will be well repaid, these fruits being much appreciated for dessert after other varieties are passed away. Simply to throw the nets over bushes of Gooseberries causes much annoyance when gathering the fruit, and ruins the nets; and if the nets have had much wear, it is almost impossible to extricate them from the bushes without tearing them to pieces and injuring the bushes. If the bushes are growing all together in a plantation, stout posts may be placed about 9 feet apart at the ends of the rows, and if the rows are too long to allow of stretching the supporting wires sufficiently tight, poles should be placed at 15 feet apart, and the wire fixed to the top of them with wire staples, thus preventing sagging of the nets. The wire having been strained tightly, the netting may be placed on them, and secured at the end and sides to the ground, or, better still, to a line of boards on edge. Trained Gooseberries on trellises or walls may have the strong shoots pruned back to three or four leaves previous to netting them, but they should not be robbed of too much growth before the fruit is quite ripe, as by doing this the flavour will be impaired. Where a wide border with an oaken fence or brick wall from 6 to 8 feet high exists, this affords a perfect place for growing Gooseberries, and especially the dessert varieties, as with wires permanently fixed on the fence and to Oak or iron posts placed firmly along the edge of the walk, there is a great saving of labour in netting them. The dessert Gooseberries in these gardens are grown and protected in this way, the border being 24 feet wide, and the wall 7 feet high.

RASPBERRIES.—Where starlings take to eating the Raspberries, it is of no use expecting to save the crop without netting them, which is a difficult matter in the case of strong-growing sorts, like Prince of Wales, the newer Superlative, and especially where it is the practice to let the canes stand perpendicularly. It must, however, be undertaken, and unless they are growing in a single row, strained wires for supporting the netting should be carried out in the same way as that recommended for Gooseberries. For a single row trained to a trellis, and where the posts for straining the wires are of wood, a stout T-piece of wood firmly fixed to the straining-posts, and 18 inches long at the top, thus projecting 9 inches on each side, will carry the wires to support the net above the canes; and poles should be placed in the same way as for Gooseberries to support the wires, which will make a sufficiently stable structure. The nets should be stretched out at the bottom, so as to admit of ready access to the fruit.

WATERING THE PLUM-TREES.—Up to the time of writing, all the Plum-trees that I have noticed are unusually healthy, free from aphis, and bearing heavily. This making it conclusive that the dripping time we had for several weeks prior to the 20th ult., exactly suited these fruits; but should the hot weather we are now experiencing continue, thorough root waterings must be afforded, at least once in a fortnight, and good washings with the hose, garden-engine, or syringe once a week at the least. Sufficient mulching should be placed over the roots, to prevent too rapid evaporation of moisture from the land. These syringings apply more particularly to trained trees on walls, but with a plentiful supply of water and appliances for its distribution, all trees would be benefited by being syringed overhead.

SWEET CHERRIES.—Bigarreau Napoleon and other late sorts, the fruit of which it is desired to keep hanging for some time, and at the same time quite free from aphis, must be made thoroughly clean, by dipping the tips of the shoots in insecticide, and then syringing the trees with the same, following this dressing with a heavy washing with clean water, the nets being of course removed whilst these jobs are being carried out. Trees cleared of their fruit, if infested with black aphis, should be similarly treated, unless it is known that the insecticide is non-injurious, when it need not be washed off, thus helping to guard the trees against further infestation.

THE ORCHID HOUSES.

By W. H. WHITE, *Orchid Grower, Burford, Dorking.*

THE ODONTOGLOSSUM-HOUSE.—Some of the plants in this house will require re-potting or fresh surfacing, the more important of these being Maxillaria Sanderiana, M. Hübschi, M. præstans, and M. americana, which are varieties best cultivated in baskets, their flowers appearing frequently in a downward direction, like those of Stanhopeas. Maxillaria Turneri and the rarer M. fuscata are cultivated very well in an ordinary flower-pot or shallow pan. Maxillarias make roots and grow freely when planted in a compost that consists of three parts of sphagnum-moss, one of peat, mixed with a good number of small clean crocks. Odontoglossum pulchellum may also be repotted at this season; and although O. Rossii, O. madrense, O. Cervantesi, O. Humeanum, O. aspersum, and O. Galeottianum are starting into growth, their natural complement of roots are not generally made till about August, therefore I cannot recommend their being disturbed in this manner before that time. Mesospinidium vulcanicum, M. sanguineum, are cool Orchids, which do best when suspended well up to the light in shallow pans, and kept plentifully supplied with water, especially in the summer; the only exception being for a period of a few weeks after growth is made, when moisture should be slightly diminished, but immediately the flower-spikes appear increasing the quantity. The charming new Cochlioda Noetzliana grows easily under similar treatment. The latter plant and the Mesospinidiums ought now to be repotted, using absolutely good drainage and a mixture of peat and sphagnum-moss in equal ratios, pressing this moderately firm around the plants. Aphides are particularly partial to the young growths of these plants, but the usual means employed will destroy them.

FRUITS UNDER GLASS.

By BAILEY WADDS, *Gardener, Birdsall Gardens, York.*

VINES IN POTS.—Those Vines which it is intended to fruit next year should now have strong canes beginning to assume the brown colour of maturity. The laterals should be removed from them, and all possible light and air afforded to get the wood thoroughly well matured; failing this, complete success cannot be expected. The roots must not be allowed to get dry. Vines struck late in the season from "eyes," which are growing in 6 or 8-inch pots for making cut-backs next spring, should be supplied with manure-water, and the house closed early in the afternoon, a good amount of atmospheric moisture being supplied during the day. The points of the shoots may be stopped when the latter are of the required length, and the laterals should be pinched back.

TOMATOS for late fruiting may be potted into 10-inch pots, good attention being paid to watering and airing. A batch of cuttings, or a sowing of seed for mid-winter supply, ought now be made; and any plants cropping heavily should be abundantly supplied with liquid-manure, those planted out in beds about once a week, those in pots every day, and sometimes twice. A free circulation of air should at all times be afforded, and the laterals removed.

PINE-APPLES.—The genial weather will have caused Pines to make good progress, and fill the pots with roots. Necessarily, careful attention must be paid to the watering, especially the early fruiters of next season, so as to obtain strong foliage; but carefully avoid making the soil too wet, or keeping the air of the house too damp by damping-down and syringing, the effect of which will be soft thin leaves and premature fruiting. A free circulation of air so far as the weather conditions will allow, should be afforded, but of course, never admitting cold currents, or unduly lowering the temperature. Ventilate early in the day, and gradually increase the amount as the day advances; and in the case of young stock, reducing the amount on sunny days in the same manner, so that the plants may have a steady uniform temperature. A damping overhead with a fine rose water-pot, may be indulged in on fine days, but not in sufficient quantity to cause the water to accumulate at the base of the leaves. It is not advisable in the northern parts of the kingdom to allow the hot-water pipes in the Pine-pits to get cold even at this season, but a little warmth is given to keep the atmosphere in a wholesome genial condition. See that the bottom-heat keeps steady, at about 85°; the day warmth of the houses will depend in a great measure on the amount of sunshine, but it should range from 80° to 90°, and that of the night from 70° to 75°. In dung-heated pits the renewing and turning of the linings should be attended to, and the bottom-heat kept as steady as may be. Suckers from early-fruited Queens or other varieties may now be potted into 6 and 7-inch pots as soon as taken off the parent plant, placing them in a bottom-heat of 85°, shading and withholding water till roots a few inches long are formed, but maintaining a moist air by damping down. Suckers for growing on should not be taken from plants that have not fruited. Fruiters with fruits swelling will benefit from doses of manure-water once a week. The night warmth for these should be 75°, and that of the day 80° to 90°, but if they are required to come on quickly, an increase of 10° over these figures may be allowed at closing time, with, of course, an abundance of moisture in the house. Ripe fruits should be removed to a cool-house or the fruit-room, where they will keep for a considerable time in a nice condition.

THE KITCHEN GARDEN

By ARTHUR COOMBES, *Gardener, Himley Hall, Dudley.*

WHAT THE VARIOUS CROPS NOW NEED.—Since writing, a much-required change has taken place in the state of the weather, and the intense heat is parching the soil. The change has allowed the hoe to be freely used in the destruction of weeds, which had become very plentiful, and mulching crops and fleet hoeing will now demand attention, Peas and Beans having the first care, so as to conserve as much as possible the latent moisture in the land. Where the soil is light, watering should be done before signs of distress are noticed, the watering being always thorough, and, when practicable, afforded in the afternoon or early morning. Neither liquid nor any artificial manures may be applied to a soil in a parched condition, but having well watered it at night, apply the manurial aids in the morning or the following evening.

MUSHROOM BEDS.—Manure that has been prepared by occasional turnings, to dissipate rank steam and prevent excessive fermentation, will be ready for forming into ridges, which may be of any desired length, 3 feet wide at the base, 3 feet in height, and 9 inches wide at the top. In building these, put the materials firmly and closely together, trampling them layer by layer, and beating the sides with the dung fork. The ridge should have ventilating holes made in them at a distance of 1 foot apart along the top, and reaching to the bottom of the ridge. When the temperature after rising has declined to about 80°, place pieces of the spawn in shallow holes along the sides, 8 or 9 inches apart. It is important that the spawn be firmly pressed into the manure and slightly covered. A slight covering of litter should be scattered over the ridge to check evaporation. In a few days the mycelium in the spawn will begin to "run," and the ridge may be cased over with loamy soil. This soil should be sufficiently moist to adhere to the ridge, and to take a smooth surface when beaten with the back of a spade; still, it should not be so wet as to crack after drying a little, as this would act injuriously on the spawn. Should the temperature of the bed decline too fast, the amount of covering may be increased.

CHICORY AND CARDOONS.—Thin the crops of these without further delay, the former 8 or 10 inches apart and the latter to one plant in a clump. Afford them water before the soil becomes very dry, and if the land is of a hungry nature occasional applications of liquid-manure.

CAULIFLOWERS.—Draw some few of the leaves over those heads that are nearly large enough for use, and tie them together, this being better than the usual practice of breaking them, excluding light and the sun's rays very effectually. A mulch of rotted manure may be put around the plants, and water afforded three times a week. Succession plants must be kept moving, or premature heads—"buttons"—will form.

PLANTS UNDER GLASS.

By J. F. MCLEOD, *Gardener, Dover House, Roehampton, S.W.*

HINTS ON THE REPOTTING OF PLANTS.—Following on the directions given in last week's Calendar, comes the repotting for such as need it—a matter which should have due consideration, the season being now too far advanced to admit of much pot-room being afforded, except in some few cases, and pots of one size larger will usually be sufficiently large. Those needing repotting should be selected and classed, so that a suitable kind of potting compost may be used for each class. I would direct attention in the first instance to the division of which Caladiums form a part. The novelties bought in this season will have become inured to their fresh quarters, and will now bear repotting into fresh soil and larger pots. The time that will have elapsed will have afforded the gardener time in which to study the character of these plants, which, when young, exhibit many forms and a variety of colours, especially recent introductions. In carrying out the repotting, the roots should not be disturbed, but the root mass dropped into a well-drained pot, one size larger, the soil made use of being that previously recommended for Caladiums. If this is in a suitable state as regards moisture, it will not need to be watered for at least twenty-four hours afterwards, the moist air of the house sufficing for that length of time. Amongst the prettiest new varieties are Ibis Rouge, l'Insolite, Baronne Clara de Hirsh, Baron Adolphe de Rothschild, Lillie Burke, Marie Freeman, Martha Laforge, and Georges Berger. The Crotons will next require to be overhauled. Strong growers like Queen Victoria, Evansianus, Disraeli, and Thomsoni may have pots two sizes larger, and loam be chiefly used in the re-potting. The narrow-leaved section of Crotons, represented by chelsonii, superbum, Countess, angustifolius, gracilis, and Lord Chelmsford, should have a rather smaller shift, and as soil, loam freely mixed with fibrous peat and charcoal. Ixoras should be re-potted in fibrous peat, sand, and charcoal, and the pots half plunged in a partly-spent tan-bed, a brisk moist heat being maintained in the house or pit.

The mixed plant stove, from the many different species it contains, gives more trouble. Take Anthuriums first, then Allamandas, Bougainvilleas, and Clerodendrons, which besides being in want of repotting, will, in most cases when not in flower, be benefited by the removal of the old ties and sticks, and a thorough cleaning. Whilst the pot-plants are being repotted, trained, &c., the roof-climbers, if in pots, and in need of repotting, should have their wants attended to without removing them from the house. Those which are not repotted may need top-dressing. All worn out and unsightly plants should be destroyed by burning. Cuttings of any plant, the stock of which is small, may be put in to strike, viz., the tops of Dracænas, Crotons, Acalyphas, &c., also leaves of foliage Begonias may be laid flat on a bed of sand in a warm house, the main ribs being first cut in various places, so as to favour the emission of roots. From these leaves, plants of a useful size may be obtained by the autumn.

TEMPERATURES.—Except in the warmest stove the Croton and Caladium-houses, fire-heat may be dispensed with, the tropical heat we are now having sufficing for the inmates of the other houses. Watering and damping down are operations that must be attended to with regularity.

EDITORIAL NOTICES.

Advertisements should be sent to the PUBLISHER.

Letters for Publication. — *All communications intended for publication, as well as specimens and plants for naming, should be addressed to the* **Editor, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.*

Plants, Fruits, &c., to be Named.—*Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be good ones, carefully packed and numbered, and not more than six should be sent at one time. Leaves only, or Florists' varieties cannot, as a rule, be named.*

Illustrations.—*The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.*

Local News.—*Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

Newspapers.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.*

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

TUESDAY, JULY 10 — Royal Hort. Soc. Committees, Drill Hall, James Street, Westminster.
WEDNESDAY, JULY 11—East Anglian Hort. Club.

SHOWS.

SATURDAY, JULY 7—National Rose at the Crystal Palace.
TUESDAY, JULY 10 — Wolverhampton Great Show (three days). Rose Show at Gloucester.
WEDNESDAY, JULY 11 — Royal Caledonian Hort. Soc., Edinburgh (two days). Rose Shows, Hitchin and Ulverston.
THURSDAY, JULY 12 — Bath Rose and Begonia. Rose and Horticultural Shows at Harlesden, Woodbridge, and Worksop.

SALES.

WEDNESDAY, JULY 11. — Highly important sale of the second portion of the famous Pickering Lodge Collection of established Orchids, formed by the late George Hardy, Esq., at 12 (two days).
FRIDAY, JULY 13. — Orchids, at Messrs. Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—63°.3.

A Gardeners' Guild.

FOLLOWING up what has been done at Birmingham, Tunbridge Wells, and other localities, and in harmony with Mr. BURBIDGE'S proposals as formulated in our columns on May 19, Mr. ELLIOTT spoke at Bournemouth on this subject on March 6. The report of his paper is only now before us, so that it is no fault of ours if we have not allotted Mr. ELLIOTT the benefit of priority. That, however, is a small point, to which Mr. ELLIOTT himself pays little heed. Schemes of this kind, differing in detail but substantially the same in principle, have been floating through the minds of those interested in the welfare of gardeners so long as we can remember; but nothing comes of them, either because the gardeners themselves do not as a body respond to the efforts that are made, or because they begin at the wrong end and immediately raise a cry for increased wages. This in itself is justifiable enough, but should come after. The competent gardener is, as a rule, greatly underpaid in comparison with craftsmen of other kinds. No one doubts this. Every one who knows, regrets it. But the way to amend it is not to clamour, still less to strike, or adopt the evil practices which bring disrepute upon some trades-unions. The evil must be attacked at its source. Entry to the practice of the art and craft of gardening should be made more difficult than it now is, and more sharp distinction drawn between a labourer, a handy-man, and a skilled gardener. Some guarantee should be exacted that the youth, before entering the garden, is of good character, fair ability, good health, and reasonable promise. At intervals during the early part of his career, he should be examined as to the amount of knowledge he has attained. In the later part of his service as an under-gardener, a report should be made by his employers or superiors as to his skill and as to his power of turning to practical account the knowledge he has attained. The object is not to make the youth a chemist, or a botanist, or a geologist, but to secure that he shall have such an amount of knowledge of botany and other subjects, as shall best enable him to turn his practical skill and experience to the best advantage. Skill can only be obtained by constant practice, but the means of utilising that skill are furnished by those branches of knowledge which some people still think lightly of as "theory," forgetful of the fact that without the knowledge that theory implies there would be no such thing as progress, and that we should still be destitute of steam engines and electric telegraphs.

A prolonged education and a practical training of the kind we have indicated, tested by competent and impartial authorities, would "rogue out" the idle and the incompetent, whilst it would encourage and give confidence to the industrious and the able. The one would remain hewers of wood and drawers of water, or would adopt some other mode of livelihood; the others would merit, and would be in a position to secure, that higher remuneration to which they would be fairly entitled.

Another means of advancing the end we all have in view is co-operation. Gardeners are notoriously like the scattered branches which have individually but little strength, but which combined can give resistance to a sea-wall, and prevent its annihilation by the waves. And yet gardeners do meet sometimes, and very pleasant their meetings are. Is there any reason why they should not be profitable also? We have, and do constantly point out, the deplorable waste of energy in connection with flower shows, especially provincial ones. Everything seems sacrificed to the competitive spirit which results in the transfer of a few shillings or a few pounds from one pocket to someone else's, without as a rule any proportionate benefit being observable in the progress of horticulture.

Surely these assemblies might be turned to account for public meetings to discuss topics of interest to gardeners, to devise schemes for the improvement of the craft, to diffuse knowledge, to further the cause of the gardening charities sorely in need of help, and generally to promote the welfare of horticulture and its practitioners. The local or district societies should federate into the county societies, and these, again, should amalgamate with the central society, the Royal Horticultural Society, where a special committee should be told off exclusively to deal with these matters; or, if it should be found that the Royal Horticultural Society, tied as it is by charters and precedents, cannot fulfil the duties, then a central committee must be formed to work independently. And here we cannot help commenting on some remarks of Mr. ELLIOTT'S to the effect that the Royal Horticultural Society has "never in any way been in sympathy with the rank and file of the gardeners throughout the country." This is a very serious indictment, but we fear it is one which is generally held among provincial gardeners, who at present have not the means, or do not use them, of ascertaining for themselves, what is the real state of affairs. Nevertheless, from long observation and experience, we must say that for what little truth there may be in such statements, the fault lies, not with the society, but with the gardeners. Have they ever taken means to make their wishes known? Have they ever even taken the trouble to suggest the election of a member of council in whom they would have confidence? Have they ever taken part in the annual meetings where their grievances could be discussed? In the terrible crisis through which the Society passed in the latter years of its existence at South Kensington, in the vigorous struggles to get free, to adopt a new and a reformed programme, based on horticultural considerations only—struggles which have so far been eminently successful — how much help and sympathy was afforded by the "rank and file," how much co-operation, or even moral support was given by local horticultural associations and district societies? We think we may say none at all! Some other statements made by Mr. ELLIOTT, as to the council and its members, we, who are not of them, may characterise as absurd, and likely to be mischievous.

If the Royal Horticultural Society does not do all that it might do in the interests of the rank and file of gardeners, that is very largely the fault of the members of that body. They are numerous enough and powerful enough to be, as they are not now, adequately represented on its council and its committees. Moreover, they are quite strong enough, if they combined, to shape the policy of the Society, but they will not do so by standing aloof and grumbling. It is such an attitude that makes one doubt the success of any guild, such as is proposed, though we are in the fullest sympathy with its objects, and shall gladly do what we can to promote them.

GREVILLEA BANKSII. — The subject of our illustration (fig. 2, p. 15) is a very handsome plant, both in flower and foliage, and is quite one of the best of the strong-growing Grevilleas. Like most of the species, it can be grown without difficulty, and probably there is no other more easily grown than this. It requires nothing more than ordinary greenhouse treatment, using by preference a loamy substantial soil, and not forgetting the good drainage which is more or less necessary for the whole of the Proteaceæ. The specimen here illustrated was cut from a robust young tree, growing in the temperate-house of the Botanic Gardens at Cambridge. It is not quite 5 feet in height, and has been grown from seed received from Brisbane about seven years ago. No doubt it could have grown to a greater height in the time, but the cutting back to which it has been subjected shows that it will bear the process and still flower freely. Grevillea Banksii is described by Meisner as an elegant tree, and the term is evidently correct. The young stems are covered with a thin brownish felt; the somewhat Lomatia-like leaves are from 10 inches to a foot long, pinnately divided into about five pairs of narrowly lanceolate divisions, above deep green, and below quite white, with fine adpressed hairs. The flowers are produced in dense terminal racemes, or in the case of stronger branches, several of these racemes gather in a panicle, each raceme in either case being 4 or 5 inches long. The cylindrical calyx is not quite three-quarters of an inch long, but with the long red style the flower attains nearly 2 inches in length. The outside of the calyx is covered with white hairs, the effect of which is to tone the scarlet, or red, of the rest of the flower. The flowers produce a quantity of nectar, which must

provide a plenteous food for certain birds, or whatever the agent may be that performs the office of cross-pollenation. Judging from the meagre information in Müller's *Fertilisation of Flowers*, our Australian friends, and others who have the opportunity of observing the Proteaceæ, would do good service by recording the agents and methods of cross-pollenation in the order. In this particular case, some agent has, perhaps, been at work by which there are now a number of green fruit. They are compressed, ovate, and turned to one side, still bearing the style, which evidently intends to persist as a beak. These fruits are covered with short white secreting hairs, which cause slight viscidity. *R. J. L.*

FIG. 2.—GREVILLEA BANKSII: GREENHOUSE SHRUB, FLOWERS ROSE COLOURED.

THE ROYAL HORTICULTURAL SOCIETY.— At the next meeting, which will take place in the Drill Hall, James Street, Victoria Street, Westminster, on Tuesday, July 10, will be displayed collections of Hardy Perennials and Cactaceous Plants, for which special prizes are offered. At 3 P.M. a lecture on "Cactaceæ" will be given by Mr. JOHN W. SINGER. After the show, a luncheon will take place at the Windsor Hotel, when the propriety of forming a Cactus Society will be brought forward by Mr. H. CANNELL.

OUR FRUIT-CROP REPORT.— Owing to the fact that our reports have hitherto been published at too early a date to be quite satisfactory as guides to the dealers and others, we intend to publish our report this year in our number for August 4.

THE ROYAL GARDENERS' ORPHAN FUND.— The committee met at the Horticultural Club, Hotel Windsor, on the 29th ult., Mr. W. MARSHALL in the chair. Among the special donations was one of a guinea from Lady FREDERICK FITZROY; and from Mr. F. MILLER, Northdown, Margate, a most efficient worker and helper, £3 10*s*. The quarter's allowance of 5*s*. per week to sixty-one children, amounting to £198 5*s*., was ordered to be paid, and the fact that this number of orphan children of gardeners is receiving benefit from the fund, should induce many more of the profession to subscribe to this most deserving fund. Another enthusiastic and successful helper, Mr. G. W. CUMMINS, The Grange Gardens, Carshalton, announced that he had arranged, in accordance with his annual practice, a Rose Fair on behalf of the fund, in connection with the exhibition of the Croydon Horticultural Society, which took place on the 4th ult.

NATIONAL CHRYSANTHEMUM SOCIETY.—A meeting of the general committee took place at Anderton's Hotel, Fleet Street, on the 2nd inst., Mr. R. BALLANTINE presiding over a good attendance. A letter was read from Mr. R. J. HAMILL, resigning his seat upon the general committee, owing to absence in America; and Mr. H. BRISCOE-IRONSIDE, formerly a member of that body, was elected in his place. The Hon. Secretary brought

up certain amendments to the rules, which were passed, and will be proposed for adoption at the annual general meeting next year. Messrs. T. Bevan, H. J. Jones, and Geo. Stevens, were appointed judges of Chrysanthemums at the early show at the Royal Aquarium on September 6 next. The recent special general meeting of members having referred back to the general committee for further consideration, with a view of giving effect to the suggestions contained therein, a special sub-committee was appointed, consisting of Messrs. W. Herbert Fowler, E. Beckett, Norman Davis, Chas. Gibson, Geo. Gordon, H. J. Jones, and E. Molyneux, with the officers of the Society *ex officio*, to draw up rules for judging Chrysanthemums, but with the proviso that these rules were to be acted upon only when absolutely necessary, having regard to the limited time at the disposal of the judges. Various other matters engaged the attention of the committee. Eight new members were admitted to affiliation; and the Newcastle-on-Tyne Chrysanthemum Society were admitted to affilation. The proceedings closed with the usual vote of thanks to the chairman.

—— The annual picnic and outing will take place on Monday, July 23. The members will travel to Windsor by the G.W.R., embark on two steam-launches at Thames Side, Windsor Bridge, proceed up the river to Bourne End, and dine at the Quarry Hotel (on the river-bank). After dinner, the launches will steam up the river as far as possible, returning to the Quarry Hotel to tea, and thence to Windsor. Ladies are, as usual, specially invited. The charge for the day, including the return fare from Paddington to Windsor and back—boat, dinner, and tea—will be 9*s.* 6*d.* to members, and 10*s.* 6*d.* to non-members. Members joining the party at Windsor or Maidenhead will pay 7*s.* 6*d.* and non-members, 8*s.* 6*d.* As this is sure to be a popular trip, early application must be made for tickets, so that all the necessary arrangements may be made, to Richard Dean, Hon. Sec., Ealing, W. Friday evening, July 20, is the latest time at which tickets will be obtainable.

"Hooker's Icones Plantarum."—The last part of this publication, which is of special value to botanists, contains twenty-five plates illustrative of new and interesting plants in the Kew herbarium. Among them are Polygala butyracea, Heckel, a native of west tropical Africa, and whose seeds contain a fatty substance of excellent quality and agreeable taste. It is cultivated by the natives, and should receive attention at the hands of those interested in tropical agriculture. Iris Thoroldi is a species from central Tibet. Dizygotheca Nilssoni is an interesting Araliad from New Caledonia, introduced by M. Linden. Several Indian Orchids are described by Sir Joseph Hooker, but they are mostly not of horticultural interest.

Reigate Cottage Garden and Rose Show.—The committee of the above Society beg to state, that owing to the very sad and unlooked-for death of their President (R. C. Baxter, Esq), which took place on Sunday, July 1, 1894, the show will be held in a meadow adjoining Wray Common, Reigate (by kind permission of F. C. Pawle, Esq.), instead of at Stone House.

M. Van Eekhaute.—We learn that in consequence of the new arrangements necessitated by the change of owners, M. Van Eekhaute, after fifty years' service in the famous establishment of Van Houtte, père, at Ghent, has now left that establishment. M. Van Eekhaute, in his long career, has secured the respect of all who knew him.

Arum dracunculus.—A recent post brought us more than one specimen of this quaint Arum, which, with its glossy and deeply divided leaves and rich purple spathe is always attractive, but never have we seen so fine a specimen as that sent us from Taplow, by Mr. Sargent, the measurements of which are:—Leaf-stalk, 17 inches; blade, 9 by 19½ inches; spathe, 21 inches by 9 at the broadest part; spadix, about 3 inches shorter than the spathe.

The Forest Trees of Mysore and Coorg.—Mr. John Cameron, the Superintendent of the Mysore Government Botanical Gardens, has issued a third edition of his very useful list of the Forest Trees of Mysore. Under the head of each species information is given concerning the name, literature, history, description, utility, and mode of cultivation. Thus, we find a dozen pages assigned to the Casuarina equisetifolia, which though not a native tree, bids fair to surpass all others in Southern India. Near Bangalore, and on the Madras coast, the plantations of this tree have altered the landscape within the last few years, and have materially dried up the soil. The work is quite indispensable to forest officers in the district, and is printed at the Mysore Government Press, Bangalore.

Oil Engines.—A Cambridge correspondent tells us that one of the features of the Royal Agricultural Show in that town was the display of oil engines. The cost of working, it is alleged, was as 5*d.* compared to 1*s.* in coal for producing steam, other things being equal. The perfume, however, was not agreeable.

Warminster Rose Show.—The twenty-sixth annual exhibition of the Warminster Amateur Rose Club was held in conjunction with a two days' lawn tennis tournament by permission of Lady Pelly and Mr. J. Doel in a field adjoining St. John's Lodge, on Wednesday afternoon, June 27. The weather was fine, and the show was largely attended. Owing to the backwardness of the season, the show was the smallest yet held; the blooms, however, were remarkably good.

The New Horticultural Society.—There was a good attendance of members of the Brighton and Sussex New Horticultural and Mutual Improvement Society at the monthly meeting held at the Imperial Hotel, Queen's Road, on Thursday evening, June 28. Mr. Balchin presided. Mr. Spottiswoode read an instructive paper on Strawberry forcing. A discussion followed, and later in the evening Mr. Miller said a few words on the cultivation of outdoor Strawberries. Several of the members exhibited baskets of the fruit for competition for prizes given by the Society. Mr. G. Hard won the 1st prize with some splendid specimens of the James Veitch variety. The annual outing of the Society was fixed to take place at Kew on July 17.

Kew Gardeners, Past and Present.—Owing to an informality in regard to the arrangements for the cricket-match mentioned by us last week, we are now informed that it will not be held as announced.

"Flora of Edinburgh."—Mr. C. O. Sonntag has published a very handy *Pocket Flora of Edinburgh* and the surrounding district, embracing, roughly, the country on both banks of the Firth of Forth to the north, the Tweed to the south, on the east from North Berwick to Melrose, and on the west from Airth to Lanark or thereabouts, the area dealt with being 36 to 40 miles in diameter. Keys to the orders and genera are given, but not to the species. Seeing how variable species are, and how misleading to the inexperienced student such keys are, we think the author has exercised a wise discretion in omitting them. In fact, they should be used as hints and suggestions to the experienced, not as gospel by the uninitiated. We do not understand on what principle the author has printed all the specific names in capital letters, nor why varieties should not be distinguished from species—e.g., Quercus Robur and Q. sessiliflora, Salisbury, are treated in the same manner, although Salisbury's plant is stated to be a variety of Robur. The method of indicating synonyms is also peculiar, and the use of the words "class" and "sub-class" to distinguish sections of a genus, as in Carex, is very objectionable. Cultivated species, like the Laburnum, should have been printed in different type. The true value of such a book can only be tested by experience in the field, but we can say that the plan of the book is good and convenient, and that it is well printed, and compact. A few misprints have come under notice in turning the leaves, such as, p. 210, Diuruscula for duriuscula; p. 227, Masileaceæ for Marsileaceæ; but, on the whole, we may congratulate the Edinburgh botanists on the publication of so convenient an aid to their studies. Messrs. Williams & Norgate are the publishers.

Protection against Cold in Conifers.—In a recent number of the *Revue Horticole*, Dr. E. Bailly gives an interesting account, accompanied by illustrations, of the way in which the leaves of Pines and other Conifers are twisted or compacted together, so as to enable them to resist frost. In other cases, the leaves have a power of movement, so that they can spread out or close up against the branches, according to the atmospheric conditions. The way in which the buds are protected receives special attention at the hands of Dr. Bailly.

Field and Garden Crops.—Mr. Duthie, the Director of the Botanical Department of Northern India, has published the third part of his useful series of descriptions and illustrations of agricultural plants cultivated in Oudh and the North-West Provinces of India. The plants are arranged under the headings of food crops, including cereals, pulses, roots, leaves, Gourds, food adjuncts, medicinal plants, narcotics, oil plants, fibres, dyes, and fodders. Of each plant mentioned, a description is given, together with the technical and vernacular names, the method of cultivation, and the purpose for which grown. Professor Church's analyses of cereals and pulse are collected in tabular form. Numerous references to works of authority, and characteristic lithographic representations, combine to render the work a text-book on the subjects on which it treats.

The Carnation and Picotee Union.—Mr. Medhurst requests us to give publicity to the fact that the annual exhibition of the above will be held in Stanley Road, Oxford, on Tuesday, July 31; and that particulars as to membership, entries, and schedule of prizes can be obtained free on application to him at that address.

Torquay Rose Day.—We extract from the *Western Morning News* of June 28, that brilliant summer weather favoured the first of the Torquay Rose days, commencing on June 27, organised by Messrs. Curtis, Sandford & Co, on behalf of the Gardeners' Relief Fund, and their efforts were rewarded with great success. There was a magnificent display of plants and blooms from gardens in Torquay and neighbourhood, and crowds of visitors were present throughout the afternoon and evening. One of the features of the exhibition were the cut Roses staged by Curtis, Sandford & Co. At the luncheon, Mr. W. Ainslie, in giving the toast, "Prosperity to the Torquay District Gardeners' Relief Fund," said that it had done much good during its career. They were indebted to Messrs. Curtis & Sandford for originating the fund which had been carried on under the presidency of Dr. Ramsey, with the assistance of Captain Fane Tucker, and had afforded relief to many gardeners and the widows of gardeners. Mr. A. Chandler, in reply, said the net income last year was £90 17*s.* 4*d.*, including £28 as the result of last year's show. The committee had met once a month, and had made thirty-four grants to sick gardeners, and widows of gardeners, amounting to £55 10*s.* The balance now in the bank was £19 5*s.* 4*d.*, the smallest amount they had yet had there. During the seven years the Rose-days on behalf of the fund had been held, the committee had received from collecting-boxes at the Rose-shows and from special donations, the net sum of £313. The committee had made 190 grants, amounting to £293 17*s.* The fund was used for temporary assistance only, and every known case of sickness amongst gardeners in the district had received relief according to the needs of the case.

New Publications.—*Report on the Phenological Observations for* 1893, by Ed. Mawley.—*Les Orchidées Exotiques et leur Culture en Europe*, by Lucien Linden, with 141 woodcuts. A magnificent contri-

bution to the knowledge of Orchids, of which we shall have to speak at length on another occasion; as also of the new edition of B. S. Williams' *Orchid Manual*, whose value is attested by its now appearing in a seventh edition!—*The Silva of North America*, by C. S. Sargent, vol. vi. (Ebenaceæ to Polygonaceæ), is a monumental work, which will require further notice later on.

TOBACCO AND SUGAR IN HAVANA.

The cultivation of these plants, and the preparation of the products for market, seem to be carried on in a very enlightened manner, judging by a recent report to the Consul-general to the Foreign Office. Pinar del Rio, the western province of Cuba, is stated to be almost entirely devoted to the cultivation of Tobacco. The plantations are scattered about in all directions, generally a mile or two apart. They consist of a number of small fields, known as "Vegas," of about 10 acres each, selected wherever the land is richest; the rest of the land is entirely uncultivated. The Tobacco-seed is sown in nurseries, about 10 lb. being used per acre. In October and November the young plants, when about 3 inches high, are planted out in the Tobacco-fields, in furrows 2 feet apart. During the three months the plants take to reach their full size, the greatest care is taken of them. Each plant is constantly examined, the green Tobacco-caterpillars killed, and the furrows kept perfectly clean with the plough. When the plant has grown its big leaves, generally about ten in number, all the small leaves are picked off the stalk, and on reaching its full height, the head of the plant is also picked off; this allows the leaves to expand and spread out in the sun. The female [?] plant gives the best leaves for the outside wrappers of cigars, as the leaves are larger and stronger. The colour of the leaf is bright green until ready for picking, when it begins to turn yellow and spotty. They are then gathered by cutting the stalk in such a manner that two leaves remain on each piece of stalk. The leaves are then strung over thin poles in the drying-houses, one leaf each side of the pole, and left to dry for about five weeks. The drying-houses are large airy barns, thatched with Palm leaves, the inside being arranged with rows of poles one above another. On being taken down, the leaves are put together in bundles of about 100 leaves, which are made into bales of usually eighty bundles, and wrapped up in Palm leaves. The bales are then ready for sale, and are taken in this state to the storing rooms of the cigar manufactories in Havana, of which there are 119 of the first class. Many of the large manufactories employ upwards of 400 men. No women are employed in cigar-rolling, although a few wash and prepare the leaves. The wages are according to skill. A good roller of cigars can earn upwards of £1 per day.

Sugar.

Of Sugar plantations in Cuba there are 577, and a large number of them are splendidly fitted up, no expense being spared in the machinery employed, and the electric light is used in all parts of the premises, so that work can be carried on continuously by day and night. The machinery has reached such a state of perfection that labour is reduced to a minimum, the few men employed at the furnaces, cooling-tanks, and centrifugal machines being usually Chinese, who are better able to withstand the extreme heat, with, of course, skilled overseers to superintend the work. The cane, owing to the natural qualities of the soil, needs but little care, and the same plants can be cut down from five to seven years in succession without renewal. Nearly all the plantations have railways connecting them with one or other of the main lines running to the different ports.

The cane, having been roughly cut down in the fields by men and women with long knives, called machetes, is brought to the factory by railway or bullock-carts. It is then thrown on to a platform, which is moved by machinery, and carries it to the crushing rollers, usually three in succession, whence the juice drips down into troughs, and is carried off to the boilers. The spent or crushed cane, which under recent improvements in the machinery used now provides sufficient fuel for the whole operation of Sugar-making, is taken by another rolling platform to the furnaces. From the boilers the juice is run into tanks to cool off. It is then passed through the triple effect and centrifugal machines, and comes from the latter in its completed form of sugar ready for exportation, and is at once put into sacks, and sent down to the ports. The molasses is transferred in barrels to the wine and alcohol distilleries. Very little sugar is at present refined in Cuba. The proposed removal of the duty on refined Sugar in the United States would make an important change in this respect, and, consequently, much anxiety is felt on the subject. If the duty were taken off, it is probable that refineries would be put up in all parts of the island, although the doubtful duration of the reform might prevent many from going to so great an expense.

HOME CORRESPONDENCE.

THE MARTIN FLOWER-RACK.—We are indebted to Mr. James Martin, of Messrs. Sutton & Sons, Reading, for this ingenious and useful invention. It is made of some white metal, and consists of two flat racks formed into small squares fixed to uprights, and so capable, when filled with flowers, of being placed in a vessel of water of a size sufficiently large to take it. Most floral decorators, as well as others, have experienced the difficulty of arranging a few flowers with taste in a wide-mouthed vessel of water, but these racks afford means by which every flower can be placed in an erect position, and that position maintained. These racks are made of varying dimensions, from 1½ inches in diameter to 6 inches, the price, which in all cases is moderate, varying with the size. This useful invention can be obtained from any dealer in horticultural sundries. *R. D.* [Figured in our columns Sept. 30, 1893, p. 407. Ed.]

THE CRYSTAL PALACE ROYAL HORTICULTURAL SOCIETY'S FRUIT SHOW.—I am sorry to learn from the horticultural press that the date of what used to be decidedly the best fruit show of the season has been altered from the first Friday and Saturday in September to the last Saturday in that month, and extending over Sunday (the 30th), and the following Monday and Tuesday, October 1 and 2. What an oversight! In the first place, the date is too late, as Peaches, Nectarines, Apricots, Figs, and Plums generally, will, in all probability, be over at least a week before the dates fixed for the show at Sydenham; and, secondly, the show, in my opinion, should not be extended over Sunday, thereby putting exhibitors to additional and unnecessary expense in having to remain in or about London on the Sunday, and rendering the fruit (excepting Apples and Pears) staged for four days in a hot and more or less dusty hall partly unsaleable. Gardeners studying their own and employers' interests are not likely to be exhibitors of fruit at the Crystal Palace under the conditions indicated. I should like to know what advantages the committee of management of the Royal Horticultural Society expect to gain by holding the show at such a late date, and by choosing the days so that Sunday should intervene? If they wanted a "three-days' show," and wished to include Saturday, why not conclude the show on that day? beginning the show on Thursday, and extending it over the two following days. It is not yet too late for the Royal Horticultural Society to re-consider the question of date and days. It does seem strange that the Royal Horticultural Society, in its laudable effort to hold a fruit show which should be worthy of its name, should choose a date (September 29 and three following days, including a Sunday) at which Peaches, Nectarines, Apricots, Figs, and Plums

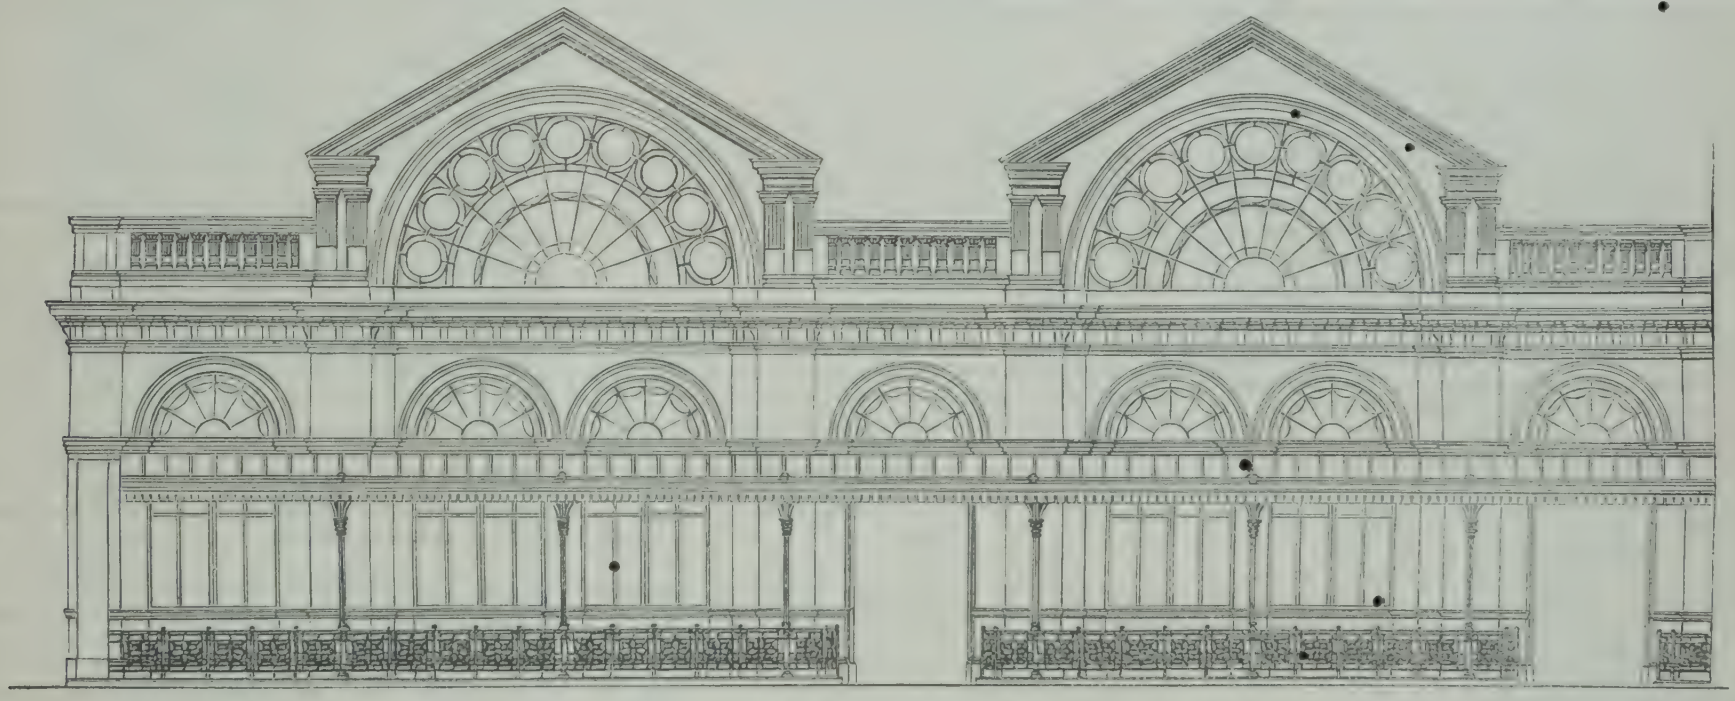

Fig. 3.—Flower Market, Covent Garden: elevation next Tavistock Street. (see p. 5.)

generally are likely to be conspicuous by their absence—simply a show of Grapes, Apples, and Pears (principally Apples and Pears), with perhaps a few Pine-apples and Melons added. In conclusion, I may add that I am a well-wisher and supporter of the Royal Horticultural Society, including the undertaking forming the subject for the above remarks, and which are penned with the best intentions by *F.R.H.S.*

—— Now that we know definitely the dates fixed for this important fruit show, it is rather unpleasant to find that the first day falls in the same week as that in which the one conference for the year at Chiswick is also fixed. The later fixture would therefore kill the former. Cannot the Chiswick gathering be held on September 11, letting the Floral Committee sit at the Palace on the 29th? or otherwise its members will have nothing to do. If, as should be, the fruit judges are selected from the Fruit Committee chiefly, that body will certainly find ample occupation. *D.*

THE POTATO DISEASE.—I have found in the Jersey Kidney Potatos, now sold in large quantities in the shops, that a large portion are diseased, probably 20 per cent. That the public have found it out is certain enough, and this fact should help our home growers to secure a good price and large demand so soon as they can put Hebrons, Puritans, Ashleafs, Early Regents, &c., into the market. At the first, the Jersey Kidneys were excellent, but this later development is doubtless due to the heavy rains which fell so abundantly but a short time since. That the disease is prevalent in the Channel Islands shows that we, too, here may suffer from it should the weather later take a cold wet turn. We may well hope the present magnificent weather will continue for some time, as under its influence Potatos are not only making rapid growth but the now heated soil is helping to swell the tubers. But for the May frosts we should now be finding early Potatos plentiful. Very few early breadths escaped, and were thus thrown back fully a month. There seems to be ample evidence that we shall have second early or midseason and late Potatos in great plenty, for the breadths now look in splendid form. But if the rains come again in July, then we must be prepared for the disease, and it will be somewhat to the discredit of gardeners, at least, if they do not now seek to combat the fungus with Bordeaux Mixture. Sprayers are not expensive, and sulphate of copper and lime cost mere songs. The time for application has to be governed by circumstances, but whether the weather keeps dry or turns wet, it is probable that a first dressing about the middle of July will be found of great good. *A. D.*

—— I am sorry to have to chronicle the first sign of the Potato disease, which I detected on June 23 in a plot of Myatt's Ashleaf growing on a south border. Since that date the malady has spread rapidly. On making inquiries in my neighbourhood I learn that the haulm is injured in a number of cottagers' gardens. In coming thus early in the season the prospects of a heavy crop of tubers is not a bright one, although a period of dry warm weather in place of the damp sultry weather which we have been having of late would afford a check to the spread of the disease to the late varieties. *R. Milner, Penrice Castle, Swansea.*

GROWTHS AND HEIGHTS OF SOME TREES.—Looking amongst some of our Cupressus Lawsoniana, I am struck with their extraordinary abundant fructification, that I thought well to gather and send you a few sprays [very remarkable]. In the parcel sent you will find about two sprays of each, cut from about a score of trees. C. Lawsoniana we have in great abundance, and these were planted more than thirty years ago on the top of a spoil-bank, which was in the first place planted with Rhododendrons, which did no good, so the C. Lawsoniana, which were about a foot high when planted amongst the Rhododendrons, were allowed to grow at will. They are now so handsomely developed in every way as to form a remarkable feature of this place. Their extraordinary growth has not been confined to the spoil-bank alone, but everywhere else in the neighbourhood, on the ordinary formation of soil, the growth of the tree has been remarkable. I can likewise speak favourably of some of our specimens of Sequoia gigantea (Wellingtonia); but so far as my experience of them goes, both here and elsewhere, where I have seen them, it is my opinion that their best days are gone by in this country. A far more satisfactory avenue could be formed of Abies Nordmanniana. A few of this species which are growing here, are splendid well-furnished specimens, straight of stem, and beautifully furnished with graceful branches all the way down to the ground. Abies Pinsapo does well here, and of these, an avenue exists of no mean length, besides numerous nicely-developed trees dotted about the pleasure-grounds. Abies cephalonica, although growing high enough, is not a success; the stem does not grow straight, for which the occasional nibbling of squirrels may have had something to do. Cedrus atlantica does well, and is a tree deserving of more general planting either as specimens or forming avenues, when there is sufficient space. It is second only to C. Libani, the grandest yet by far of all Conifers. It is unfortunate that many of the finest trees of the latter were spoiled when young, by allowing several leaders to go away, and which subsequently became rivals, and liable to be split off and the tree left little better than a wreck. Of the number of Lawsoniana seedlings at Coombe Abbey, no two are quite alike, and you will observe the same dissimilarity maintained throughout the seeding. We have no pinetum, but in the pleasure grounds of near upon 50 acres the trees have plenty of room in which to fully develop. I send herewith the height and girth of a few trees, planted about thirty and thirty-two years ago. The measurements are as under:—

Abies Nordmanniana, height, 39 ft. 6 in.; girth, 3 ft.
Thuiopsis borealis, height, 32 ft. 6 in.; girth, 3 ft.
Abies Pinsapo, height, 36 feet; girth, 3 ft. 6 in.
,, cephalonica (older tree), height, 54 ft. 6 in.; girth, 4 ft. 9in.
Pinus, height, 46 ft.; girth. 4 ft. 3 in.
Sequoia gigantea (Wellingtonia), planted by Lord Coventry, height, 44 ft. 11 in.; girth, 12 ft. 11 in.
Libocedrus decurrens, height, 35 ft. 6 in.; girth, 5 ft. 4 in.
Pseudotsuga Douglasii, height, 51 ft. 6 in.; girth, 5 ft.
Cupressus Lawsoniana, height, 42 ft. 6 in.; girth, 3 ft. 8 in.

The circumference in yards of the extended branches of a T. borealis is 17; A. Pinsapo, 32; C. Lawsoniana, 18. *W. Miller.*

ABNORMAL ROSES.—We send you a sample of our Roses to show how badly they are doing this season, and to ask if you or any of your numerous readers can suggest a cause and a remedy. You will note some of the buds are rotten at the top of the stem, and in many cases the stem also is dead. Some seem unable to open, being almost suitable for bullets, so hard are they; others have opened partially, or almost singly, like Dog-Roses. Roses on these trees were a picture last season. This spring (in April) they were well manured, and they are doing fairly well as regards growth of wood and foliage. The Teas are much better than the H. P.'s, but are affected in many instances. The soil is stiff and retentive, with a gravelly subsoil. Now, is this due to the late severe frost at the end of May, or to blight, or is it both? [both]. and would syringing help them? and if so, what liquid compound would be best to use. [Of no use now.] *D. & Co.*

RELATIVE VALUE OF GRAPES IN COMPETITION.—The comparative value of Grapes in the following list is computed on the general excellence of the varieties, all points or properties being considered. At the top of the list is Muscat of Alexandria. This Grape is unique in possessing all the qualities desired in the highest degree, and no one will grudge it the position of pre-eminence which it occupies here. For distinction and convenience it may be classed "A 1," and allowed the highest relative value—9·10ths of a point, three points being maximum allowance for cultural value. The remaining twenty-four varieties, which represent the best for exhibition, are divided into classes 1st, 2nd, and 3rd, to which is accorded relative value, ·8, ·7, and ·6, respectively:—

A 1 Class, Muscat of Alexandria, Value ·9.

1st Class Black Grapes.		*1st Class White Grapes.*	
Black Hamburgh Madresfield Court Mrs. Pince Muscat Hamburgh	·8	Canon Hall Muscat Duke of Buccleuch Golden Champion Mrs. Pearson	·8

2nd Class Black and White Grapes.

Alicante Gros Colmar Gros Guillaume Lady Downes' Seedling	·7	Buckland Sweetwater Foster's Seedling Golden Queen Tokay	·7

3rd Class Black and White Grapes.

Alnwick Seedling Black Prince Cooper's Black Gros Maroc	·6	Raisin de Calabre Syrian Trebbiano White Nice	·6

It will be noted that flavour is the predominating element of the varieties occupying the 1st class, which, with the exception of Black Hamburgh, Duke of Buccleuch, and Golden Champion, all partake more or less of the Muscat flavour. The three last-mentioned gain what they lack in this respect by their appearance and other excellent qualities. Madresfield Court, Mrs. Pince and Muscat Hamburgh, are all handsome Grapes of the highest excellence. Canon Hall Muscat is a Grape very little behind Muscat of Alexandria in quality or appearance; while Mrs. Pearson, a comparatively new Grape, has medium-sized berries, but of excellent colour and flavour. It is liable to rust, which spoils it; but when successfully treated and grown alongside Muscat of Alexandria, it forms a strong rival, remaining plump and fresh after that variety begins to shrivel. The black varieties in the 2nd class are handsome in appearance, take on a good colour and bloom; and the last three in this class, when grown and ripened in suitable temperature, are very little inferior to the Black Hamburgh in quality. The white varieties in this class are also pretty evenly balanced, Foster's Seedling being, if anything, the weakest variety among them. Some of the black varieties in the 3rd class might have, without much hesitation, been put in the 2nd class. It is not an easy matter with some of them to give the exact point where the higher value should end and the lower begin, but the line must be drawn somewhere. The white varieties, however, are all inferior to those named in the 2nd class. Trebbiano is the only one that may be considered a shade above those of the same colour placed along with it in the 3rd class. Referring to February 10, p. 177, showing the relative value of different kinds in a collection of fruit, it will be observed that a third-rate variety of Grapes is put on the same terms relatively as a good variety of Melon, or dish of Peaches—a station that I have no doubt will be generally appreciated. *W. W.*

MANURE FOR, AND ASH OF, CHRYSANTHEMUMS.—In the *Gard. Chron.* for June 23, p. 778, an article appeared giving the food requirements of the Chrysanthemum. To know what the ash of a plant contains is to give a basis to work upon in the selection and application of any artificial manure we may wish to apply. One item was lacking—that was, the quantity of ash from a given quantity of stem, leaves, &c.; for if we knew how much minerals was required to form an average-sized plant, we should know better what quantities to give to the plant. The artificial manure recommended by the writer of the above-mentioned article is not quite in accordance with the ash from the plant. Take, for instance, the potash and magnesia in the recommended artificial manure. We are told to apply one part of potash to two parts of magnesia; why should we give more magnesia than potash, when the analyses point to more than 6 per cent. more potash than magnesia, viz., potash, 16·23; magnesia, 10·22? The sulphate of iron seems quite out of place in a manure, for enough iron is present in all soils for the healthy development of plants. Again, the superphosphate contains more sulphuric acid than lime, and yet in the analysis the lime predominates 21·63 per cent. The phosphoric acid present in the phosphate of soda and superphosphate is also in excess, there being 6·4 parts of phosphoric acid to every one part of potash, or six times more phosphoric acid than potash, the analysis showing potash 16·23, and phosphoric acid 19·52. Perhaps the writer will tell us why, in applying this artificial manure, we give so much superphosphate and magnesia in proportion to the small quantity of potassic manure. *W. Dyke, Turnford, Herts.*

EARLY POTATOS.—Mr. Gilbert, writing in a recent issue of the *Gardeners' Chronicle*, seems, I think, to have made a mistake in the date of lifting early Potatos, and if he will kindly refer to the *Gardeners' Chronicle* of June 9, he will see the date mentioned is April 28, and not May 24, so that will bring Lincolnshire nearly one month behind Sussex. Of course, there is nothing new in planting Potatos at the foot of south walls but I thought the date of digging was, and that was the reason of my recording it. *A. Gooden, Shopwkye House.*

ROSA LAXA AS A STOCK.—Amongst the numerous consignments of trees and shrubs which for the last two or three years have been imported from Holland, and sold at one of the leading horticultural auction rooms in Birmingham, several scores of standard Roses have created some amount of speculation as to the identity of a certain Briar stock, possessing a very spindly and distorted habit of growth; the shoots, however, of the Roses with which they were budded appeared to thrive, as evidenced by their vigorous growth. The stocks do not commend themselves to the eye of the rosarian, so dissimilar in appearance are they to the ordinary

Briar as to impress one with the idea that they are not Briars at all, especially as all the spines had been carefully trimmed off. I understand its specific name is Rosa laxa, indicating a spreading habit, and, according to Sweet, it is a native of North America. It would be interesting to learn further information as to its attributes and cultivation in this country. *W. Gardiner, Birmingham.*

POSITION OF KITCHEN GARDENS.—In former years, before mechanical appliances were so numerous, one of the chief considerations when selecting a site for a kitchen garden was that of the supply of water, and for this reason the lowest-lying places were invariably chosen, so that there might not be any difficulty in getting a constant supply. Whether it was then understood that such places were more subject to cold currents, and therefore not so well suited for fruit and vegetable culture, it is difficult to know. One thing, however, is certain, there were not the same facilities for recording the differences in temperatures in various localities as there are at the present time. It would still be more interesting if those supplying this information would state the elevation the thermometer is above the sea level, and the chief features in the surrounding country. My immediate neighbourhood is hilly; our kitchen garden, however, is in a valley, with a stream running close to it, and though 15 miles from the sea, it is not more than 100 feet above its level. The cold current sweeps along the valley to such an extent that the soil becomes quite frozen, while half-a-mile away higher up the hill there is no frost at all. On April 16 the thermometer went down to 26° Fahr., and on the 17th to 22°; on each of these two days it rose to 50° in the shade. On the 18th it again fell to 22°, and on the 19th to 25°. The sun, however, was very bright on both of the latter days, so that it rose to 54° and 56° respectively, thus showing the great difference between the night and day. The rainfall, too, in the valleys is considerably less than on the hills, the average here for the last fifty years being 29·90 inches a year. No doubt the soil in these low places is much richer than in more elevated positions, plants grow much later in the autumn, and are therefore more tender and less able to resist frost. In choosing a site for a kitchen garden, these things ought to be taken into consideration, even though it be necessary to have it half-a-mile or more from the dwelling-house. Could those responsible for fixing the situation of a kitchen garden know the anxious hours a gardener is caused, owing to it being so unfavourably placed, doubtless more pains would be taken to select better sites. Those having to work such places are put to great disadvantage in many respects. They are unable to plant or sow very early in spring, and frost comes much sooner in the autumn, cutting things off, whilst their neighbours' are left untouched. We have often had Potatos and French Beans cut off here in June, although we are so far south, and invariably all tender plants are cut down by frost in the valley here quite a month sooner than they are a few miles off, where the elevation is something like 600 feet more. These matters should be taken into consideration by those who are thinking of planting fruit trees or making kitchen gardens, if they would avoid the worries attendant upon early and late frosts. *H. C. Prinsep.*

ROYAL INSTITUTION.

Mr. Ludwig Mond, F.R.S., is about to convey to the Managers of the Royal Institution of Great Britain the freehold of No. 20, Albemarle Street, to be held by them for the purpose of a laboratory to be named "The Davy-Faraday Research Laboratory of the Royal Institution," and for the purpose of providing increased accommodation for the Institution.

"I have felt," says Mr. Mond, "that the need for such a laboratory has become greater and greater since the work of the scientific investigator has become more and more subtle and exact, and, in consequence, requires instruments of precision, and a variety of facilities which a private laboratory can only very rarely command; and surely this need exists nowhere to a greater extent than in England, and nowhere can such a laboratory be expected to bear more abundant fruit than in this country, which possesses such an unrivalled record of great scientific researches, which have emanated from private laboratories not connected with teaching institutions, and amongst which the laboratory of the Royal Institution stands foremost, and has kept up its reputation for nearly a hundred years.

"It has been my desire for many years to found a public laboratory, which is to give to the devotees of pure science, anxious and willing to follow in the footsteps of the illustrious men who have built up the proud edifice of modern science, the facilities necessary for research in chemistry, and more particularly in that branch of the science called physical chemistry.

"As only want of space prevented the Royal Institution undertaking this task fifty years ago, I took the opportunity which offered itself last year of acquiring the premises, No. 20, Albemarle Street, adjoining the Institution. This property I found

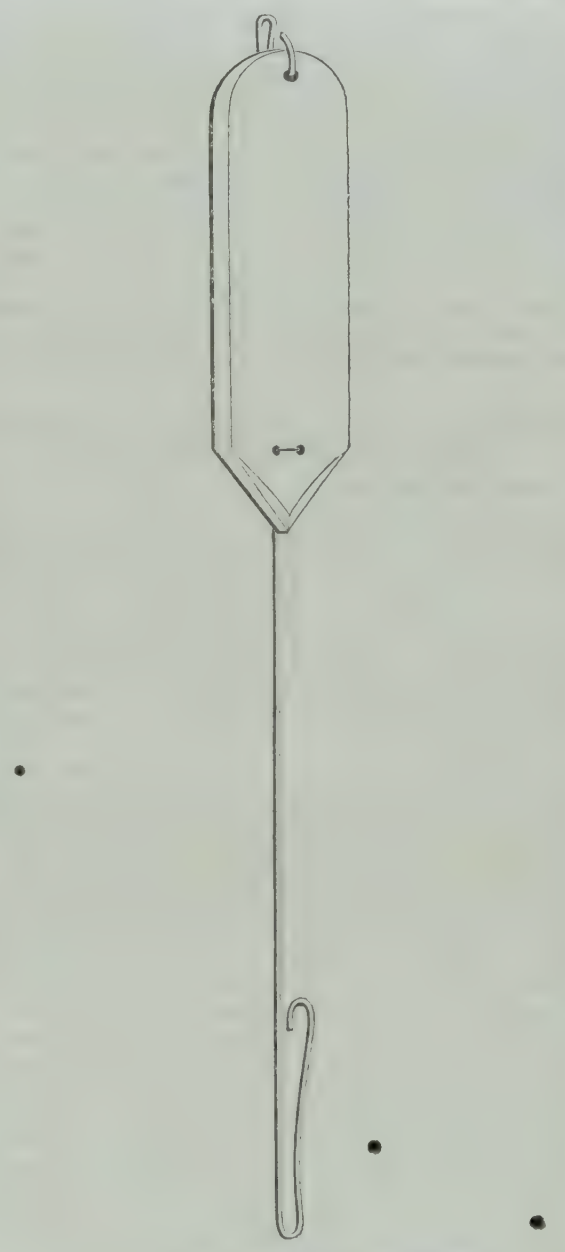

Fig. 4.—A NEW FORM OF GARDEN LABEL.

very suitable for the purposes of such a laboratory, and large enough to afford, besides, facilities to the Royal Institution for a much-needed enlargement of its present laboratory and its libraries and reception rooms, which I should with great pleasure put at the disposal of the Institution, to be held by them for the purpose of a laboratory, to be named 'The Davy-Faraday Research Laboratory of the Royal Institution,' and also for the purpose of providing increased accommodation for the general purposes of the Royal Institution, as far as the available space will allow, after providing for the requirements of the research laboratory.

"I also offer to make, at my own expense, all structural alterations necessary to fit the premises for these purposes, and to equip the Davy-Faraday Research Laboratory with the necessary apparatus, appliances, &c., and to make such further adequate provision as will hold the Royal Institution free from all expense in connection with the premises and the working of the said laboratory. . . .

"I am aware that my offer will not provide for the third object of the scheme of 1843, viz., to enable the professors to work out their problems by the aid of many qualified hands; but I trust that if the laboratory which I offer to found proves successful, others will come forward who will supply the means for attaining this end, by the foundation of scholarships and bursaries to qualified persons willing to devote themselves to scientific work, and not in a position to do so without assistance."

A NEW FORM OF GARDEN LABEL.

We do not suppose that any form of label for garden purposes is new, in the strict sense of the word; still, we accept the term in its usual application, notwithstanding an Egyptian, Chinese, or Jewish gardener may have anticipated the maker of the present label by several thousands of years.

Mr. James Ritchie, gardener, Devenlich, Strathtay, who kindly sent several specimens of labels suited for various purposes, states truly that it is cheap, simple, and durable, and one was not in the least the worse for wear after hanging for four years on an Apricot tree in the open air. Another had been for two years in use as an address label on boxes of flowers sent weekly to the town residence of the family. The illustration (fig. 4) is self-explanatory, and all that is required is strong galvanised iron wire, some red deal, white lead paint, and varnish, and any handy man can make the labels. The wire is bent at the end, so that the position of the label may not be altered by the action of the wind, as it always is where one straight iron support only is used.

CALIFORNIAN PLANTS.

Some Showy Species of Diplacus.—There are four species of this beautiful genus now (May 9) flowering in the Botanic Garden of the University of California: the commonest species—D. glutinosus—has not yet commenced to bloom, being, with us, always a later-flowering plant.

In the *Genera Plantarum*, Mr. Bentham's genera, Diplacus and Eunanus are reduced to the rank of sub-genera under Mimulus; Professor Greene, however, has since restored them (*vide Bull. Calif. Acad.*, i., 94 and 96) on the ground—in the case of the first-named genus—of the formation and peculiar dehiscence of the capsule, the uniform shrubbiness or suffrutescence of the species (which does not occur in Mimuli, as far as I am aware), the vernation, pubescence, and—last but not least—the almost indescribable but very marked "generic cut" of the corolla. It is unnecessary to repeat here Professor Greene's comprehensive defence for the retention of the genus; it may be found in full in the *Bulletin of the California Academy of Sciences*, vol. i., pp. 94 and 96; and in *Pittonia*, vol. ii., pp. 151—157; but as the species most commonly cultivated appears to fruit but rarely, if ever, in Europe, it may be of interest to note the peculiar dehiscence of the capsule; as Professor Greene remarks, the firm valves, parting at first only by the upper suture, lie open like a boat-shaped follicle, each bearing its own distinct placenta, and that with a broad, thin, spreading margin which almost conceals the seeds. This pod, at first boat-shaped by a partial dehiscence, is held in this shape by a tubercular enlargement of the base of the style. With us these boat-shaped capsules are persistent on the plant until the following flowering season commences.

D. glutinosus, Nutt.—This plant, so well-known in English greenhouses, and the commonest species, is abundant among the foothills around Berkeley. The last of those species under cultivation here, to commence flowering, it continues in bloom until December. I am unacquainted with the varieties stellatus and latifolius.

D. puniceus, Nutt., has the closest affinity with glutinosus, but differs from it in the smaller and blood-red corolla, with narrower lobes, and the narrower leaves with very revolute margins. The calyx-teeth are slenderly acuminate. At Berkeley it comes into flower in April. It is a native of San Diego Co., Southern California, where it is said to be very common. Seed of this and the next species has been sent to the Botanic Gardens at Kew and St. Petersburg, and it is hoped that an attempt will be made to grow them there.

D. parviflorus, Greene, *Pittonia*, i., 36 (1887), is related to the last, but is very distinct; the corolla-tube is much longer and less funnel-form—in fact, almost tubular—slightly constricted at the throat, with a bright yellow band 1 line wide running down its whole length outside; the lobes are scarcely at all spreading, and the mouth of the corolla only measures about half an inch across. In colour, the whole corolla is brighter than that of D. puniceus, the blood-red tint appearing to contain more orange. The leaves are much broader, and scarcely revolute. This species is endemic to Santa Cruz Island, off the coast of Southern California.

D. longiflorus, Nutt.—Perhaps the most handsome species of the genus, the bright but lighter-tinted buff corollas being more than twice the size of those of glutinosus. The corolla-lobes are about 9 lines long, and their apices somewhat deeply emarginate and erose, those of the upper being obliquely emarginate. The calyx and growing parts are more or less soft, and even cobwebby-tomentose. The whole length of the flower, including calyx-tube, is about 2½ inches, and the mouth measures 21 lines in length and breadth.

D. speciosus, Mihi (*vide* Erythea, June, 1894).—Suffrutescent, 2—2½ feet high; new shoots virgate, very erect from the now somewhat decumbent growth of last year; flowers primrose-scented; corolla, 1½ inch long, 1¼ inch broad, buff-yellow, with lines of clear white and of orange down the throat within; lobes sub-equal, regularly and almost rotate-spreading, sub-cuneate, quadrate; anthers, orange-coloured. In habit, foliage, pubescence, and size of corolla, this species is near to longiflorus, from which it is very distinct, however. The latter plant exhibits a tendency to greater elongation of its parts, especially the internodes, leaves, calyx-teeth, and corolla lobes, but the most striking and characteristic difference between the two, lies in the cut of the corolla. As regards general outline, the corolla of D. longiflorus is more clearly bi-labiate, though the slender side-lobes of the lower lip are widely divergent, and slightly curved outwards.

D. speciosus is a native of Humboldt co., in California, and the specimens from which the description in Erythea is drawn, have been flowering at Berkeley for two seasons.

All the above-mentioned species are hardy under cultivation with us, readily reproduce themselves from self-sown seed; but the red-flowered kinds appear to be rather short-lived. D. speciosus is the only scented plant of the genus with which I am acquainted. *J. Burtt Davy, University of California, Department of Botany, Berkeley, U.S.A.*

SOCIETIES.

CANTERBURY AND KENT ROSE.

JUNE 28.—This show being confined to the district, except in two classes for nurserymen and one open class, together with the clashing of several Rose shows of note, accounted for the somewhat empty appearance the tables presented. A wise arrangement is that of compelling the winner of the chief first prize in one of the lower sections, to compete a section higher in future seasons, and prevents that complete sweeping of the board too often seen at shows confined to a locality. Upon this occasion we noted that S. H. Dean, Esq. took all three 1sts in section B. All honour is due to this gentleman, but it is certainly more encouraging to the others that he is not eligible to compete for this cup the following year.

Amateurs: section A.—Eighteen singles, Cooper Wacher, Esq, 1st, with Maurice Bernardin, Marie Baumann, A. K. Williams, Dupuy Jamain, and Fisher Holmes as his best blooms. This prize is a cup, presented by the vice-president, and it was only just missed by Col. Pitt, 2nd, who ran his rival very close. For twelve singles, Col. Pitt was a good 1st, the Rev. H. B. Biron and Captain Christy following in the order of their names. Nine Tea or Noisette Roses produced some close competition, Mr. R. L. Knight, Mr. Cooper Wacher, and Col. Pitt winning in the order given. For six trebles, Col. Pitt, Rev. J. R. Buchanan, and Rev. H. B. Biron were successful.

Section B.—As already noted, Mr. S. H. Dean took 1st in all classes, that for twelve singles, being a cup by the Mayor of Canterbury; Mr. Honeyball and Mr. R. Smith were 2nd and 3rd. For 6 Tea or Noisette varieties, Mr. P. Selby and Miss Hawksworth were successful after Mr. Dean. Mr. R. Smith and Miss Hawksworth occupying similar positions for 4 trebles.

Section C.—9 singles, 1st, Canon Holland; 2nd, F. Knight, Esq.; this position being changed in the following class for 6 singles, Canon Holland also winning for 6 Teas or Noisettes.

Section D.—6 singles, 1st, Lieut.-Col. Poole; 2nd, Mrs. H. G. Deeds. 3 singles, J. McMaster, Esq, 1st; W. Saunders, 2nd. The same exhibitors won in the class for three Teas or Noisettes. J. Stonely, Esq., was 1st for six of any H.P., and Cooper Wacher, Esq., 1st for six Teas or Noisettes.

Mr. Mount did not find any rival in the classes for nurserymen, but Colonel Pitt made a fair fight in the open class for twelve Teas or Noisettes.

THE PEOPLE'S PALACE AND EAST LONDON HORTICULTURAL.

JUNE 28, 29, 30.—The first exhibition of this society was held at the People's Palace, Mile End Road, on the above dates, and a very good start indeed was made. The schedule of prizes contained just over forty classes, and though some of them brought no competitors, which was to be regretted, this being the first attempt, there was yet enough of exhibits to promise well for another year. It is satisfactory to know that the society is in a good financial position, and accessions are constantly being made to the list of members. All round the sides of the Great Hall and in the centre were contributions, not for competition, from various persons who are interested in the society's work. In the centre was a large and imposing collection of ornamental foliage and flowering plants from Her Majesty the Queen, lent by Mr. Thomas, from Frogmore; a large table of a similar character from his Grace the Duke of Fife, President of the Society; and a bold group of Palms, &c., from Mr. Holmes, Frampton Park Nurseries, Hackney. Other contributions of this character included an extremely attractive collection of plants and flowers from S. B. Boulton, Esq, Totteridge; Messrs. W. Cutbush & Sons, Highgate; Mr. H. J. Jones, Ryecroft Nursery, Lewisham; Mr. H. Selfe Leonard, Hitherbury, Guildford; Lord Rothschild, Gunnersbury Park, Acton; The Royal Botanic Society, Regent's Park; Messrs. J. Cheal & Sons, Lowfield Nurseries, Crawley, &c.; and floral decorations from Mrs. Butchart, St. Swithen's Lane, E.C.; and three charming epergnes from Miss L. Hudson, The Gardens, Gunnersbury House, Acton.

Most of the subjects competing came from the Tower Hamlets, grown by working men; among them Fuchsias, decorative and zonal Pelargoniums, Cannas, Begonias, Lilies, Ferns, Aspidistras, &c. Two remarkable fan-shaped Fuchsias, *bonâ fide* window-grown plants, were shown by G. Haydon, Longfellow Road, Mile End, grown in the window of a room inhabited by him and his wife; and to one of these, in addition to the 1st prize awarded to it in its class, it received the Silver Banksian Medal of the Royal Horticultural Society. Cannas, some of the Ferns, a tuberous-rooted Begonia or two, a fine Plumbago capensis, Aspidistras, and a capital plant of La France Rose were particularly good.

Prizes were offered for the best-kept forecourt or back garden within the Tower Hamlets, which includes Shoreditch, Bethnal Green, Old Ford, Hackney, and Bow; and the judges visited these gardens on the day previous to the show, and they were surprised at the success which attended the efforts of some of the fourteen competitors. The best was that of H. Nicholls, 27, Lichfield Road, E., who is engaged in the City for ten hours a day. It was a delightful back garden, with a small greenhouse or two, admirably kept, Ferns and flowering plants alike in rude health. This garden afforded an admirable illustration of what enthusiasm and attention can develop in a somewhat crowded locality; probably a good deal of the success is due to the care bestowed on the garden by the competitor's wife during his absence in the city.

TUNBRIDGE WELLS HORTICULTURAL.

JULY 4.—The 36th annual exhibition of the above society was held in the Great Hall and Calverley Hotel Grounds. For some series of years the shows have been unfortunate as regards the weather, but this year there could be no complaint. Most of the classes were well contested, and the following is a list of the principal prize-winners. We cannot append a full report of the whole 86 classes, so many other meetings demanding attention.

Open to all England, four stove and greenhouse plants, Orchids excluded:—1st, Mr. T. Portnell, gr. to Sir A. Lamb, Bart., Battle; 2nd, Mr. J. Mason, gr. to H. J. Wood, Esq., Southborough.

For four ornamental foliage plants:—Mr. S. Pope, gr. to J. J. Barrow, Esq., was a splendid 1st (having grand plants of Cycas revoluta and Crotons; and Mr. T. Portnell, 2nd.

Four exotic Ferns saw Mr. Pope well in front again, and Mr. Portnell 2nd.

Groups of plants were numerous, and effectively arranged. These are a feature at this show, five prizes being offered for those occupying a space of 10 feet by 6 feet. The name of the three first are given in their order of merit:—Mr. J. Howes, gr. to Walter Cobb, Esq., Tunbridge Wells; Mr. J. Mason, gr. to H. J. Wood, Esq., Southborough; and Mr. L. Dupond, gr. to C. B. Powell, Esq., Langton. There were eight competitors.

Cut Flowers.—Twenty-four distinct species of herbaceous flowers.—1st, Mr. J. Charlton, with a splendid and varied collection; 2nd, Mr. H. Ware, gr. to Rev. J. Tillard.

Three stands for table decoration saw a spirited competition between Mr. A. Hatton, Sevenoaks, and Mr. Sidney Cook, gr. to B. Crawshay, Esq., of the same town; the result being in the above order.

1st and 2nd for a single stand went to Mrs. A. Hatton and Miss Eva Simpson respectively.

A collection of cut flowers (stove and greenhouse), eighteen varieties, were well shown by Mr. T. Portnell, who gained 1st honours.

Wreaths, wedding-bouquets, sprays, and buttonholes, are always numerous here, the chief winners being Mr. G. Newman, Mr. C. Earl, and Mr. John Charlton.

Six plants for table decoration: 1st, Mr. L. Dupond, gr. to C. B. Powell, Esq.; 2nd, Mr. F. Earley.

Six Caladiums: 1st, Mr. J. Allan, The Gardens, Ashurst Park; 2nd, Mr. H. Ware, Penshurst.

Six distinct Fuchsias: 1st, Mr. Wakeford, with beautifully-feathered specimens; Mr. G. Elmes being 2nd.

Pelargoniums were a great feature, Mr. H. Wickens, gr. to J. Wheelwright, Esq.; Mr. J. Allan, gr. to G. H. Field, Esq; and Mr. M. Wakeford being the most successful exhibitors.

Roses, Open Classes.—For forty-eight varieties, single blooms, Mr. G. Mount, nurseries, Canterbury, was 1st, his best blooms being Duchess of Bedford, Fisher Holmes, Duke of Connaught, General Jacqueminot, Eugène Forestier, and Mrs. J. Laing. Mr. Young was 2nd, and had good flowers of Fisher Holmes, Xavier Olibo, Duke of Teck, and La Rosière.

Twelve Teas or Noisettes: 1st, Mr. Mount; Mr T. Durrant Young, Eastbourne, 2nd.

Amateurs and Gentlemen's Gardeners.—For twenty-four single blooms, Mr. H. Foster, Ashford, was a good 1st, F. Freeman Thomas, Esq., being 2nd.

Six Teas and Noisettes: 1st, R. Buston, Esq.; 2nd, Rev. J. Tillard. In the above four classes the National Rose Society gave a Bronze Medal for the best bloom, which was won by a good example of Mrs. John Laing, in the stand from Mr. Mount.

Fruit.—For three bunches of Black Hamburgh Grapes, Mr. C. Earl, gr. to Sir J. Goldsmid, was 1st; and a very close 2nd in Mr. Thomas Palmer, Southborough.

Three bunches of any other variety (black) was secured by Mr. Earl, with Madresfield Court.

A similar number of white Grapes found Mr. Harvey, gr. to Mrs. Tennant, in front of Mr. Earl.

Collections of fruit were good, Mr. Earl being 1st for nine dishes.

Vegetables—For a brace of Cucumbers, Mr. G. Denton was 1st; 2nd Mr. H. Ware.

For a collection of vegetables, nine distinct kinds, Mr. A. Henderson was 1st, with a grand lot.

For the best box or basket from single-handed gardeners, six distinct kinds, the 1st prize went to Mr. T. Furze, gr. to the Rev. J. Mather, Rusthall. A special prize, presented by Messrs. Sutton & Sons, for the best collection of six kinds, was won by Mr. J. R. Booth, gr. to J. C. Drew, Esq. A similar prize for nine varieties, given by Mr. J. Charlton, seedsman, Tunbridge Wells, went to Mr. J. Friend, gr. to the Hon. P. C. Glyn, Godstone.

Plants from Local Growers.—This division contained some good specimens, the 1st and 2nd prizes going in the order given after each class.

Six stove and greenhouse plants in bloom: 1st, Mr. S. Pope; 2nd, Mr. J. Mason, gr. to H. J. Wood, Esq. Four ditto: 1st, Mr. S. Pope; 2nd, Mr. J. Mason.

Six ornamental foliage plants: 1st, Mr. S. Pope; 2nd, Mr. J. Mason. These two exhibitors had well-grown plants.

Roses.—Twelve varieties (single blooms): Mr. G. Elmes, gr. to C. R. Fletcher Lutwidge, Esq, and Mr. C. McCarter, gr. to Freeman Thomas, Esq., Eastbourne.

Six varieties: 1st, The Rev. J. Tillard, and J. C. Drew, Esq., 2nd.

Six of any one variety: R. Buston, Esq., Hurstleigh, 1st, with Marie Beaumann; Mr. Elmes being 2nd, with the same variety.

Nine singles for residents within the local act district of Tunbridge Wells: 1st, Roger Buston, Esq.; 2nd, Mr. G. Elmes, gr. to C. R. Fletcher Lutwidge, Esq.

The National Rose Society's Bronze Medal, for the best bloom in the above four classes, was not awarded, the judges failing to discover a flower worthy of this honour.

Cottagers' Division.—Collection of cut flowers, 1st, Mrs. Stevens.

Collection of Roses, 1st, Mr. J. King.

Box of fruit, six varieties, Mrs. Markwick, who was also 1st for a box or basket of four varieties.

Basket of vegetables, nine varieties: Mr. T. Morris, Groombridge, 1st; and Mr. J. Crowhurst 2nd.

Basket of vegetables, five varieties: 1st, Mr. H. Skinner, Groombridge; Mr. J. Crowhurst again being 2nd.

A large marquee was filled with cottagers' productions, and the vegetables were particularly good.

Non competitive.—The chief exhibits not for competition were a large collection of herbaceous flowers from Mr. J. Charlton, which was one of the finest we have seen this season, and occupied a space of over 30 feet; W. Cutbush & Son, Highgate, staged a bank of their Malmaison and other Carnations; Mr. C. Earl, gr. to Sir Julian Goldsmid, Bart., M.P., also had a collection of cut Malmaisons.

New Invention

A NEW PATENTED WATERING-MACHINE.

We were enabled a few days ago to inspect a very ingenious invention for watering lawns and low-growing crops, the outcome of Mr. A. J. Protheroe's endeavour to lessen the attention always required by lawn-sprinklers. The invention (patented May, 1893) has for its object to provide means whereby the sprinkler can be caused to move from place to place without an attendant. The sprinkler is mounted upon a carriage, upon which is also mounted a small turbine driven by a part of the water passing to the distributor. This water-motor is connected by gearing with the wheels or axles of the carriage in such a manner that the passage of water through the water-motor to the distributor causes the carriage to travel in a direction straight backwards, but the direction may be regulated by means of a steering-wheel fixed upon the carriage.

The water is distributed through nozzles fixed at about 2 feet apart, on ¾-inch iron tubing, and having slits for openings, so as to distribute the water in flat sheets. The iron tubing in front is connected with the turbine or power-box, by two short lengths of similar tubing, and can be made to cover a space of 40 feet in width. The actual length of the piece in use at the Temple Gardens, where the sprinkler was inspected, was about 20 feet. The apparatus travels backward on level land at an uniform rate of 6 inches per minute, thus allowing of sufficient time to thoroughly moisten the soil to some 2 inches or more in depth, according to its texture. The handles of the machine support a coil of 200 feet of ⅝-inch india-rubber tubing connected with a hydrant, having a pressure of 45 lb. to the square inch, but a somewhat greater pressure would be desirable, and ¾-inch tubing instead of the ⅝; then the quantity of water thrown would be greater, and the speed a little accelerated. The machine is of great use wherever a sufficient head of water can be obtained, and the land is fairly level; and as the water falls like a shower, there are no streaks left on the turf such as a machine would leave that did not deliver the water as a shower of small drops, a matter of considerable moment on cricket-pitches, where a lot of parallel lines would prove of great annoyance to the bowlers.

When the 200 feet of hose is paid out, the machine must be moved to another part of the lawn in need of water, and the hose coiled up again. It would be excellent for watering large seed-beds, such as those of summer-sown Turnips and Spinach, plants of Celery, Leeks, saladings, Cranberries, Strawberries after the fruit is gathered, lawn grass-seeds, &c. The inventor is a son of the well-known horticultural auctioneer.

Obituary.

Hugh Austin.—The death occurred on Saturday at Cathcart, N.B., of Mr. Hugh Austin, of the firm of Messrs. Austin & M'Aslan, a man who was in the very prime of life, and whose name, and that of his father, has been so long and so well known over the West of Scotland. The firm of which he was a member began business in 1717, and has continued a successful career to the present day. Since 1873 the deceased has had control of the nursery department. He was 45 years of age, and unmarried.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

0, Scotland, N. *Principal Wheat-producing Districts*—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. *Principal Grazing, &c., Districts*—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; *Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending June 30, is furnished from the Meteorological Office:—

"The *weather* during this week was warm, dry, and very fine over almost the whole of the Kingdom; slight rain fell, however, at many of our western stations during the first day or two, and dense fog was experienced on our eastern coasts during the latter part of the period.

"The *temperature* was above the mean in all districts excepting 'England, E.,' the excess ranging from 6° in 'Scotland, N.,' to 2° in 'England, S. and the Channel Islands,' and to 1° in 'England, N.E.' The highest of the maxima were registered on the last day of the period, when the thermometer rose to 86° in the 'Midland Counties and Scotland, N.,' to 84° in 'England, S. and E.,' and to between 81° and 83° in most other districts. The lowest of the minima were recorded during the earlier days of the week, and ranged from 38° in 'Scotland, E.,' and 40° in 'Scotland, N.,' to 49° in 'England, N.W.,' and to 50° in the 'Channel Islands.'

"The *rainfall* was much below the mean. Over nearly all our southern and eastern districts there was an entire absence of rain throughout the period.

"The *bright sunshine* was much more prevalent than of late, and exceeded the mean in all districts. The percentage of the possible duration ranged from 41 in 'Scotland, N. and E.,' and 43 over 'Ireland,' to 60 in 'England, S.W.,' 64 in the 'Channel Islands,' and 67 in 'England, S.'"

Markets.

COVENT GARDEN, July 7.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. Ed.]

SEEDS.

LONDON: *July* 4.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that to-day's market was very thinly attended, with scarcely any business doing. No attention is yet given to either Clover seed or Trifolium. Neither Mustard or Rape seed show any alteration. As regards Canary seed, the market keeps very strong at the recent great advance in values. For Hemp seed prices are firm. Peas and Haricots continue steady. Other articles in the absence of transactions are without feature.

FRUITS AND VEGETABLES.

BOROUGH AND SPITALFIELDS: *July* 3.—Quotations:—Cabbages, 9*d.* to 2*s.* 6*d.* per tally; Turnips, 2*s.* 3*d.*; Parsley, 1*s.* 6*d.* to 2*s.* per dozen bunches; Onions, Egyptian, 5*s.* 6*d.* to 6*s.* per cwt.

STRATFORD: *July* 3.—The supply to this market during the past week has been a good one, and, with a large attendance of buyers a brisk trade was done at the undermentioned quotations:—Cabbages, 6*d.* to 3*s.* per tally; Cauliflowers, 2*s.* to 2*s.* 6*d.* per dozen; do., 8*s.* 6*d.* to 12*s.* per tally; Turnips, 2*s.* to 2*s.* 6*d.* per dozen bunches; Carrots, household, 1*s.* to 3*s.* per dozen bunches; Mangels, 18*s.* to 25*s.* per ton; Onions, Egyptian, 90*s.* to 110*s.* per ton; Green Peas, 2*s.* to 3*s.* per bushel; do., 4*s.* to 6*s.* 6*d.* per bag; Cucumbers, frame, 1*s.* 3*d.* to 3*s.* per dozen; Lettuces, 8*d.* to 1*s.* 3*d.* per score; Radishes, 9*d.* to 1*s.* per dozen bunches; Gooseberries, 2*s.* to 3*s.* per half-sieve; do., 3*s.* 6*d.* to 4*s.* per flat; Cherries, 3*s.* to 8*s.* per half-sieve; Black Currants, 4*s.* to 5*s.* 6*d.* do.

FARRINGDON: *July* 5.—Quotations: Cabbages, 2*s.* to 2*s.* 6*d.* per tally; Peas, 4*s.* to 5*s.* per sack; do., sieves, 2*s.* 3*d.* to 2*s.* 6*d.*; Onions, 1*s.* 6*d.* to 2*s.* per dozen bunches.

POTATOS.

BOROUGH AND SPITALFIELDS: *July* 3.—Quotations for old Potatos ranged from 55*s.* to 110*s.* per ton; new being quoted at 8*s.* 6*d.* to 11*s.* 6*d.* per cwt.

FARRINGDON: *July* 5.—New: Hebrons, 9*s.* to 10*s.*; Puritans, 9*s.* to 9*s.* 6*d.*; Early Monarch, 9*s.* to 9*s.* 6*d.*; White Hebrons, 9*s.* to 10*s.* per cwt. Old: Lincolns, 90*s.* to 100*s.* per ton; Rose, £9 10*s.* to £11 10*s.*; Midlands, £8 to £10 per ton.

LONDON AVERAGES: *July* 4.—Old: Bruces, 80*s.* to 110*s.*; other kinds, 50*s.* to 80*s.* per ton. New: English Hebrons, 8*s.* to 10*s.*; do. Kidneys, 10*s.* to 12*s.*; Jersey do., 9*s.* to 11*s.*; Lisbons, 5*s.* 6*d.* to 7*s.*; French, 6*s.* 6*d.* to 8*s.* per cwt.

NOTICES TO CORRESPONDENTS.

*** *Owing to the large increase in our circulation, we are reluctantly under the necessity of going to press some hours earlier. Our contributors, who well know what this implies, will kindly aid us by sending their communications as early in the week as possible. Communications should reach us not later than Wednesday.*

AMERICAN BLIGHT ON APPLES: *A. B. S.* Destroy by fire as much as you can, and use petroleum emulsion to the rest.

CRYSTAL PALACE ROSE SHOW: *C. M.* The date is July 7.

CUCUMBER: *J. B.* The bottom-heat may have declined unduly, or there may be eel-worms at the root. Please send specimens of the latter.

DENDROBIUM: *Sydney.* The Dendrobium sent is not to be accurately determined by the dried specimen supplied. It may be a small form of D. Fairfaxii, Rolfe. You did not state its native habitat. We should like to know that, and have a better specimen sent us.

GRAPES: *W. M., J. H. R., Chepstow, X., Sender of Black Alicante, Eastwood Park,* and *H. C. W.* The berries sent are badly affected with "spot," Gloeosporium laeticolor. There is no cure when the malady has reached the bad state observed in these berries. Cut off and immediately burn all the berries similarly affected. Another season, try to avert an attack by the early use of the Bordeaux Mixture.

GRAVEL FOR WALK MAKING: *C. B.* If the person, under this signature, who made enquiries about gravel will communicate with us, we will give him the names and addresses of some wholesale dealers.

HELLEBORE ROOT, DISEASED: *Reader.* The fungus is Sclerotinia Libertiana, Fckl., described and figured in the *Gardeners' Chronicle,* September, 1883 (as Peziza postuma), as attacking Potatos; it is also known to attack Ranunculaceæ and Crucifers. If any plants be yet living, they should be removed, and after steeping the roots in dilute Condy's Fluid for six hours, be planted in a fresh place. The soil in which they are at present growing is saturated with the spawn and sclerotia of the fungus. *G. Massee.*

INSECT: *Jas. Garaway.* Grubs of Daddy Long Legs or Crane-fly (Tipula oleracea).

INSECTS ON CURRANTS: *Urick.* The insect with the woolly covering on the Currant bushes is known as Pulvinaria ribesii. It belongs to the family of "scale" insects (Coccidæ), and is nearly related to the "woolly-bug." Any treatment applied to the latter in conservatories, or to the "American Blight" on Apples would be efficacious against the Currant-bush pest. Try petroleum emulsion. *R. McL.* The formula for making petroleum emulsion: Hard soap ½ lb., boiling water 1 gallon, petroleum, 2 gallons. Dissolve the soap in the water, add the petroleum, and churn with a pump or syringe for 10 minutes; dilute 10 to 15 times before applying. For all insects which suck, and those with soft bodies.

MARGUERITES: *C. M.* A leaf miner. Nip the grub, which is readily seen, between thumb and finger-nail. That will do where the damage done is not great; but where many burrowings are made the leaf is sure to die, and it is best therefore, to cut off and burn it. You might try Quassia-water as a deterrent to the fly that selects the Marguerite, Chrysanthemum, Celery, &c., on which to lay its eggs.

MILDEW ON VINES: *A. J.* At this part of the season Bordeaux Mixture may be used as a preventative against mildew, washing it off ten minutes after applying it. Do not use it when the berries are approaching ripeness. If you favour the old remedy, sulphur, dissolve a few ounces in skim milk, and when reduced to a smooth paste, dilute with water. It will do no harm if allowed to remain on the Vines. Wherever the mildew has established itself on the berries the skin is injured, and will not swell any more, hence disfigurement and decay. This holds good of the foliage as well, although the mildew may be killed by the means used in both cases. Where mildew cannot be prevented by proper attention to ventilation and temperature, the Bordeaux Mixture may be used from the time the Vines go out of bloom.

NAMES OF PLANTS: *W. J. B.* Saxifraga cotyledon var. pyramidalis; sometimes known in gardens as S. nepalensis.—*E. C. C. D.* Lycium barbarum.—*C. A H.* The so-called Crown or Mummy Pea, a fasciated variety that comes true from seed; needless to say, it has no connection with mummies.—*A M.* Eccremocarpus scaber.—*R. R.* 1, Galega officinalis alba; 2, Hieracium aurantiacum; 3, Asperula odorata; 4, Allium Moly; 5, Veronica gentianoides; 6, Othonopsis cheirifolia.—*H. G.* Vanda brunnea, Rchb. f.—*W. H. D.* 1, Geranium ibericum; 2, Phyteuma orbiculare; 3, Send again when in fruit; 4, Sisyrinchium angustifolium; 5 Eriogonum umbellatum; 6, Potentilla fruticosa. *Truro.* 1, Escallonia leucantha; 2, Cistus albidus; 3, Cotoneaster bacillaris; 4, Spiræa canescens.—*Max Leichtlin.* Cyanella rosea, Ecklon.—*D. W.* 2, Ranunculus, double variety of R. acris, probably; 3, Senecio Doronicum.—*G. H. S.* 1, Agrostemma Githago; 2, Cytisus capitatus; 3, Lysimachia ephemerum; 4, Hemerocallis flava; 5, Baptisia exaltata; 6, Next week; 7, Calystegia pubescens var.; 8, Rosa multiflora.—*C. H. J.* 1, Campanula persicifolia var.; 2, Prunella sp.; 3, Œnothera fruticosa; 4, Erigeron philadelphicus; 5, Lychnis Haageana; 6, Philadelphus coronarius.—*R. McF.* Clethra arborea.—*Chepstow.* Piptanthus nepalensis. *Richard Grupp.* Gongora galeata.—*H. J. R.* A small form of Cattleya Leopoldii.—*C. J. G.* 1, Galium palustre; 2 Crepis biennis; 3, Senecio erucifolius; 4, Hypericum perforatum; 5, Nasturtium palustre; 6, Nasturtium amphibium; 7, Sonchus arvensis; 8, Scutellaria galericulata; 9, Rumex (specimen insufficient).—*Constant Reader.* The Publisher has nothing to do with such matters. Another time, do not send more than six specimens. Time is precious. 1, Veronica spicata; 2, Lychnis chalcedonica; 3, Gnaphalium margaritaceum; 4, Linaria cymbalaria; 5, Arum Dracunculus; 6, Cerastium sp.; 7, Hypericum humifusum; 8, Anthericum lineare variegatum; 9, Centaurea montana.

NOTICE TO QUIT SERVICE: *X. Y. Z.* and *W. T.* In the absence of any written engagement to the contrary, the gardener is assumed by law to be a yearly servant, and entitled to one quarter's notice, and in your case to an equivalent in money for that period, and for loss of lodgings, vegetables, fuel, &c. It is customary in small places to reduce the notice required from either party to one month. Your remedy is in the County Court.

PEACH: *X.* We cannot undertake to name a Peach without some knowledge of the kind of flower and leaf, and you afford no particulars.

PEACHES: *G. S. T.* Nothing can be detected now on the roots; but the nodules on them are such as might be set up by the irritation caused by the puncture of a mite. *R. McL.* We have but little belief in the concreting of Peach borders, as the concrete hinders capillary attraction of the moisture upwards from below, and the due aëration of the soil, and should the concrete floor have a sharp descent to the front, or layer of drainage materials placed on it there is risk of the soil becoming dangerously dry, unless very thoroughly watered at intervals; and this risk is greater under glass than out of doors, although there are many failures of the latter chronicled. Examine the state of the soil, and cut off and burn all blistered leaves.

PELARGONIUMS: *W. F.* We cannot undertake to name florist's varieties of the Pelargonium. Send blooms to some large grower of these plants.

PERENNIALS FOR FLOWERING IN JUNE: *G. S.* Potentillas in variety, Heuchera sanguinea, Delphiniums, Alstrœmeria aurantiaca, Tropæolum polyphyllum, Gaillardia in variety, Pyrethrum roseum in variety, Carnations, Picotees, mule and other Pinks, Doronicum austriacum, Iris germanica, I. pallida, I. sibirica, I. iberica, I. reticulata, I. cristata, I. xiphioides, and many others; Gladiolus byzantinus, G. cardinalis, G. insignis, G. segetum, Anthericum Liliago, Asphodelus creticus, A. luteus, Chrysobactron Hookeri, Hemerocallis flava, H. fulva, and others; Lilium bulbiferum, L. candidum, L. pomponium, L. pyrenaicum, Muscari comosum, M. moschatum, Ornithogalum narbonnense, O. umbellatum, Scilla peruviana, S. nutans, Astrantia major, A. Biebersteinii, Doronicum plantagineum, Centaurea caucasica; many of the Saxifrages bloom in June, and for their names we must refer you to some nurseryman's catalogue; Geum montanum, Orobus cyaneus, Geranium argenteum, G. pratense, G. sanguineum, Hypericum Androsæmum, and others; Lychnis chalcedonica, L. coronaria, &c.; Gypsophila paniculata, many species and varieties of Viola; Thalictrum aquilegifolium, T. flavum, Ranunculus aconitifolius flore-pleno (Fair Maids of France). The above will furnish capital subjects for the herbaceous border, affording variety in colour of flower, habit, and stature.

ROSE INSECT: *W. Stuart.* Larvæ of the Rose-sawfly, and can only be exterminated by persistent hand-picking.

TOMATO SENT WITH A BLACK ALICANTE GRAPE: *X.* Peronospora infestans, described by Mr. C. D. Plowright in vol. xiv., 1881, p. 621. Use Bordeaux Mixture.

TREE OF LIFE: *Botany.* This mythical tree in ancient times had many types, such as the Date Palm, the Fig, and the Pine or Cedar. The idea that mankind sprang from a tree was prevalent among primitive peoples, and is so at the present day among the Damara, and some of the natives of the Philippine Islands. You will not find the Tree of Life given in any nurseryman's catalogue.

May 27, 1893, The Dell, Englefield Green, Surrey.

ROBERT WARNER & Co., Engineers, 27, Jewin Crescent, E.C.

Dear Sirs,—It affords me much pleasure to inform you the 25 ft. Annular Sail Windmill, on 40 feet timbers, working a set of 3 in. × 9 in. stroke treble pumps, that you fixed here for Baron Schröder, is giving very great satisfaction, pumping the water through 4,224 feet of pipe, to a vertical height of about 80 feet. I must also express my thorough appreciation of the manner in which the whole of the work has been so successfully carried out.—Yours faithfully,

H. BALLANTINE, Head Gardener to Baron Schröder.

We have just made and erected a similar Mill and set of Pumps for Lord Northbourne.

NUMEROUS OTHER TESTIMONIALS ON APPLICATION TO

ESTATE SALES.
The Best County Medium for Advertising Sales of Estates is
THE "WORCESTER HERALD,"
ESTABLISHED 1794,
The Leading County Paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to forward for reference and distribution plans and particulars of Estates, Catalogues of Machinery, Furniture, Books, and other property advertised in the columns of the "HERALD."

Sales of Stock and Agricultural Effects.
The "WORCESTER HERALD" is the most effective organ for giving publicity to announcements of this class. It is the leading Agricultural Paper in the County, and Circulates most extensively among Agriculturists in and around Worcestershire.

Farms to Let.
Land Agents, Estate Managers, and all having Farms to Let, would do well to advertise in the "WORCESTER HERALD," the leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large circulation. Moderate charge.

Situations Vacant and Wanted.
For producing results the "WORCESTER HERALD" is recognised as a specially good medium. Cheap Rates.

AND SIXPENCE FOR EVERY ADDITIONAL LINE.

If set across two Columns, the lowest charge will be 20*s.*

If set across three Columns the lowest charge will be 30*s.*

Page, £8; Half Page, £4 10*s.*; Column, £3.

Gardeners and others Wanting Situations. 26 *words, including name and address,* 1*s.* 6*d.*, *and* 6*d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.*

Births, Deaths, and Marriages, 5*s. each insertion.*

Notice to Advertisers.—*In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.*

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

Position.—*Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.*

Postal Orders.—*To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to* A. G. Martin, *as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.*

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST *reach the Office by first post, Thursday morning.*

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements,
41, Wellington Street, Strand, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months. Post-office Orders to be made payable at the Post-office, Great Queen Street, London, W.C., to A. G. Martin.

Subscribers who experience any difficulty in obtaining their copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

JOURNEYMAN.— A young man, age 21, seeks a situation as above, who has been living for three years under Mr. FORD, Wexham Park, Slough. Excellent character.—H. REED, 21, Stayton Street, Chelsea, S.W.

JOURNEYMAN (Indoors), in a first-class Nursery or Private Establishment.—Mr. D. ANDERSON, Florist, Teddington, S.W., can recommend a young man (age 22), as above, six years.

JOURNEYMAN, Inside, or Inside and Out.—Age 21; four years' experience. Three years at Highclere Castle.—S. BUTLER, Yew Tree Cottage, Cookham Common, Newbury, Berks.

JOURNEYMAN, in a good establishment; age 25.—W. WELCH, Hartham Park, Corsham, Wilts, will be pleased to recommend E. Pratten as above.

JOURNEYMAN, Inside.—Four and a half and two years' good character.—E. MARRIOTT, The Gardens, Holme Grange, Wokingham.

JOURNEYMAN, Inside, or Inside and Out.—Age 19. Excellent references from last and previous situations. — W. COOMBES, Waterloo Cottage, Katesgrove Kiln, Reading, Berks.

JOURNEYMAN, Inside. — Age 20; seven years' experience. Good references.—H. PERKINS, Oak Tree Place, Selly Oak, Birmingham.

JOURNEYMAN, Inside or Out.—Age 24; Used to General Nursery work. Well up in Tomatos. Good references.—S. CLARK, Dunts Hill, Wandsworth, S.W.

JOURNEYMAN (Inside and Out).—Age 18; five years' experience. Good references from present and previous employers.—H. HANKINS, The Gardens, Moor Park, Farnham.

JOURNEYMAN, Inside, under a good Foreman; age 21.—J. FORSEY, Stanford Hall Gardens, Loughborough, would be pleased to recommend a young man as above. Three years in present situation, and three with Messrs. Paul & Son, Waltham Cross.

TO HEAD GARDENERS. — £2 10*s*. Bonus. A young man requires a situation, thorough JOURNEYMAN, in a large establishment, or SECOND of four. Age 26, single; steady and obliging. Well recommended. Bothy preferred.—KNOWLES, 9, Mount Pleasant, Mitcham Road, Croydon.

IMPROVER, under Glass; no objection to a little Outside Work.—Age 18; two years' good character. Bothy preferred.—JAMES ENGLISH, Horns Road, Ilford, Essex.

IMPROVER, Inside, or Inside and Out.—Age 18. Strong and willing; good character.—E. J., Mr. F. Laurence, Park Corner, Brimpton, New Reading, Berks.

IMPROVER.—A young man seeks a situation in Nursery Work.—S. W., Lyon House, Ashley Road, Tottenham, London, N.

IMPROVER, under Glass, by Gardener's son (age 17), used to Glass. Inside and Out. Bothy preferred. W. J., Blythe Bridge, Stoke-on-Trent, Staffordshire.

TO NURSERYMEN. — Situation wanted. Thoroughly experienced in Vines, Cucumbers, Tomatos, and Chrysanthemums. Good references. State wages to D. FERGUSSON, The Vineries, Scotby, near Carlisle.

TO NURSERYMEN.—A young man of good education, seeks a situation in a Nursery. Four years' experience of General Inside Work and slight knowledge of Seed Trade. Would like to get into a good Nursery where he could improve himself.—X., 41, Wellington St., Strand, W.C.

TO NURSERYMEN.—A young man, age 21, wants situation; five years' Nursery experience, chiefly among soft-wooded stuff. First-class references.—F. BARNES, 27, Clemens Street, Leamington.

TO GARDENERS.—Situation wanted by a respectable Lad in the Garden. Good references from last employer.—J. G., 18, Eden Road, West Norwood.

TO GARDENERS.—Situation wanted, in a Garden, by a young man, age 21; two years' good character. Willing to make himself useful.—N. CARPENTER, Long Cross, Chertsey, Surrey.

TO GARDENERS, &c.—Situation wanted, by young man (age 23). Abstainer. Good character.—W. F., 1, Kingsgate Cottages, Shoot-up-Hill, Brondesbury, N.W.

CLERK.—Wants situation in Nursery Trade. Experienced. Could assist in other Departments, if required. Age 31; good references.—S., 15, Lisburne Road, N.W.

TO ORCHID GROWERS.

WEST'S PATENT ORCHID PAN.

Registered.

In inviting the attention of Orchid-growers to this Pan, the inventor begs to say that it is not a mere experiment just put upon the market, but that it is the result of a careful trial extending over several years, conducted by an Orchid-grower of great experience. The Pan entirely overcomes all the deterioration that is caused by the unsuitability of the ordinary pans for Orchid culture, and combines in itself all the conditions obtained by the Orchid in its natural state, especially those of free drainage and a moist atmosphere. At the same time it gives absolute safety from slugs, cockroaches, &c.

PRICES, ON RAIL—CRATES AND PACKING EXTRA.

2 in., 2*s.* 6*d.* per doz.; 2½ in., 3*s.* per doz.; 3 in., 3*s.* 6*d.* per doz., 4 in., 4*s.* per doz.; 5 in., 5*s.* per doz.; 6 in., 6*s.* per doz.; 7 in.; 8*s.* per dozen; 8 in., 10*s.* 6*d.* per dozen; 10 in., 16*s.* per dozen; 12 in., 20*s.* per dozen.

GARDEN HOSE.

MERRYWEATHER'S

CHIEF SPECIALTIES IN HOSE:

1.—NON-KINKABLE "RED-GREY" HOSE.
2.—"SPHINCTER GRIP" ARMOURED HOSE.
3.—HIGH-CLASS RED RUBBER HOSE.

Made on the same lines as the Hose used with their celebrated Fire Engines.

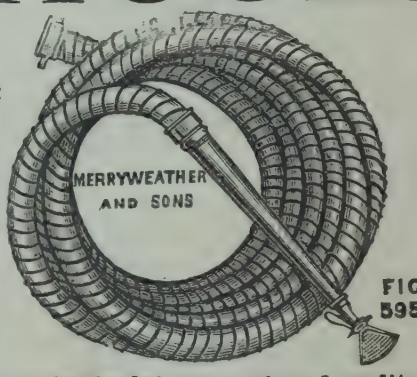

FIG 595.

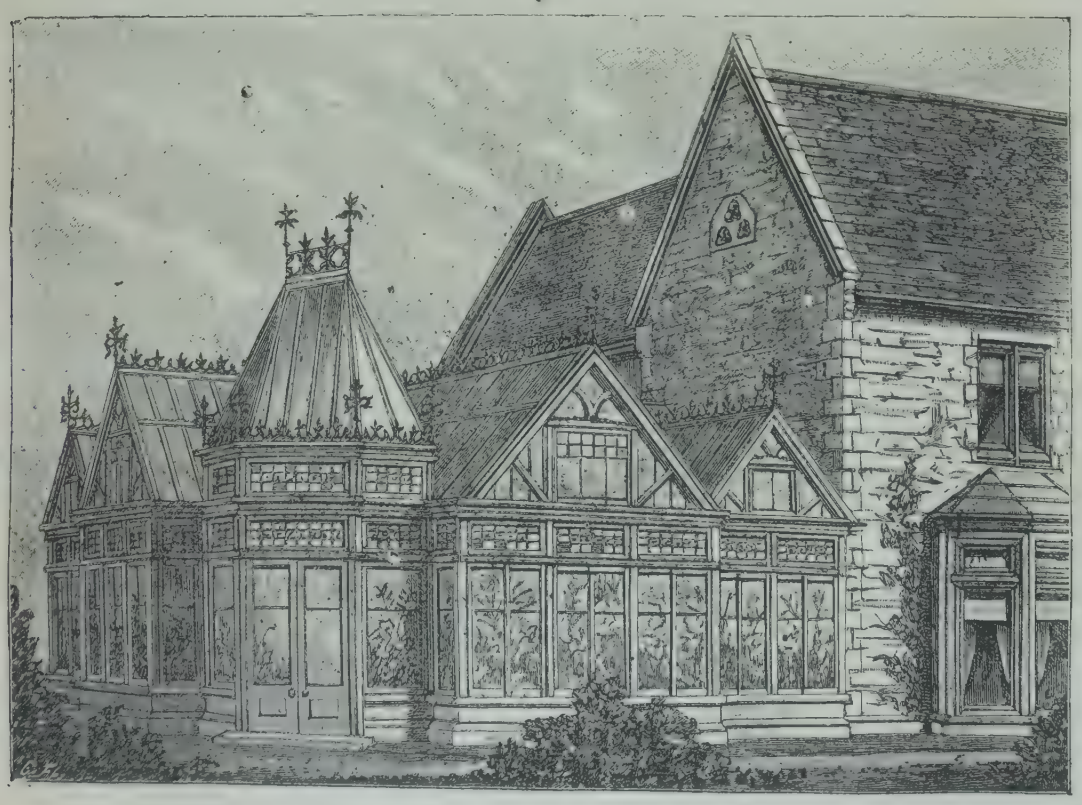
See that Merryweather's name is embossed on every length, this is the only absolute guarantee of quality

Merryweathers' introduced Sphincter Grip Hose into this country in the year 1887; they are the Original Makers, and they still sell a Hose which is far superior to every other in the Market.

Beware of Wire-armoured Hose which is counterfeit, and inferior Foreign make.



Users of Hose are cautioned against inferior qualities sold by dealers who have copied our method of advertising, but have not adhered to our high quality. Orders executed the same day as received.

Merryweather's High-class Garden Pumps and Watering Appliances to be seen in action at

63, LONG ACRE, LONDON, W.C.; or write, Greenwich Road, S.E.

Friday Next, July 20.

CATTLEYA DOLOSA (Rchb. f.)

REINTRODUCTION OF THIS SUPERB DWARF-GROWING LARGE-FLOWERED CATTLEYA.

WITHOUT QUESTION THE MOST MAGNIFICENT OF THE WHOLE SECTION.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, by order of F. Sander & Co., St. Albans, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, July 20, at half-past 12 o'Clock—

A truly superb Importation of the rare and beautiful

CATTLEYA DOLOSA,

in simply perfect order and condition, eyes sound and dormant, bulbs plump and fresh plants all ready to flower. Flowers 5 to 6 inches in diameter, varying in colour from pure white to rich maroon-purple; some snow-white varieties were observed by the collector, others had white sepals and petals, and a purple labellum, while others again were of a soft rosy-pink—old flower-spikes on the plants show as many as five flower seats.

This Orchid ranks in beauty with Dendrobium Schroderianum, Vanda Sanderiana, and the very best and showiest of all the family, and our collector describes the plants when seen in bloom as having the appearance of being covered with huge and brilliant butterflies.

Also a nice batch of the lovely and now rare self-coloured

ONCIDIUM CONCOLOR,

producing its beautiful golden yellow flowers on long drooping racemes; the importation is in capital order.

ANGRÆCUM HUMBLOTII.

The freest flowering, the easiest grown, and most useful of all Angræcums. Superb imported plants, both large and small to suit all buyers.

CYPRIPEDIUM INSIGNE, SANDERÆ SECTION.

A grand importation just to hand.

VANDA ROXBURGHI, MILTONIA ILLUSTRIS, &c.

On view morning of Sale, and Catalogues had.

TO DUTCH BULB GROWERS AND ENGLISH BUYERS.

MESSRS. POPE AND SONS wish to call the attention of the above to their SALES of BULBS, which will be held every TUESDAY and THURSDAY, commencing THURSDAY, August 23.

FLORISTS, and others requiring large quantities of Bulbs, cannot do better than give these Sales a trial, as we are sure (from a life-long experience of the Trade) that the Bulbs usually sold are good, sound, and true to name, and at Prices that cannot be touched in the Trade.

To DUTCH BULB GROWERS.—We shall be open to receive Consignments of good sound Bulbs, true to name, for Sale by Auction, and shall always do the best possible for all Senders, and send Account of Sales and Cheques immediately after the Sale.

POPE AND SONS, Horticultural Auctioneers, 6, Phillips Street (adjoining the Market Hall), Birmingham.

WANTED, to RENT a small NURSERY, with or without House attached. West or North-west district preferred. No objection to take to Stock, &c.—Address, with full particulars, as to size, rent, lease, &c., to M., 2, Queen's Terrace, Finchley Road, N.W.

ROSE SHOWS.

I HARDLY ever knew a Rose show about which opinions did not differ, very often these opinions being formed from ideas previously held. One is quite sure that it must be an indifferent show; others are equally sure that it must be a good one, and coming with these ideas already formed, they are unwilling to see anything that militates against them; and so it happens that various opinions have already been expressed as to the southern show of the National Rose Society, held under the patronage of the Queen at Windsor—and there certainly never was a more complete overturning of the anticipations and prophecies made concerning it. In the early part of April the rosarians were writing that the show was much too late, that it ought to be put forward at least a week; and if it were not, all the southern growers would be out of the running. But then came a spell of cold weather, such as we often experience in May; and instead of southern growers finding it too late, they were all crying out it was much too early for them—the Roses were not yet in flower!

The great centre of attraction was, of course, the competition for the Queen's Cup, and here especially the character of the season asserted itself; at the outset there were twenty-six entries, but these were reduced on the day of exhibition to thirteen, and a competition from which such growers as Messrs. Lindsell, Budd, Pemberton, Machin, and Hill Gray, were absent, was not of the representative character which we all expected—and the Rev. H. A. Berners, who secured the much-coveted prize, candidly acknowledged that it was a piece of great good luck. The Roses with which he won it were of good but not exceptional merit, and he himself stated that he had often staged a better twelve. I think that this is not improbable, but we must not take too much from the merits of the stand, but remember the character of the season which hitherto has not been favourable to the amateur. I think, in looking carefully through the recent show, one came to the conclusion that the amateur portion of it was its weakest point; but then, how could it be otherwise, when an experienced grower like Mr. Burnside stated that he could not have staged another box of blooms beside the very few which he brought up? and, as I have said, some of our largest growers were entirely unrepresented. There were, however, amongst the Teas, at any rate, some remarkable blooms: that of Cleopatra, which obtained for Mr. Burnside the Silver Medal of the National Rose Society as the best Tea Rose in the amateur section, was what the French call "hors ligne;" it was not, however, as I have seen stated in a contemporary, 9 inches across, which is about the size of one's hat. This

was cut from a standard, as were also the six for which he obtained a 1st prize for the best blooms of any one variety of Teas—a tolerably good confirmation of the opinion held by many growers of Teas that this is the way to get the finest blooms. I thought the Madame Cusin with which Mr. Foster Melliar gained a Medal at the Crystal Palace last year, was the grandest example of a Tea grown by an amateur I have ever seen; but the exquisite form, delicacy of colouring, and perfect purity of this bloom of Cleopatra, gave it the precedence even over that fine flower. I think there were stands there that won prizes, which would in ordinary seasons have been left out in the cold, and no one was more surprised at the positions they gained than the exhibitors themselves.

To some extent the character of the season also affected the professional exhibitors. For this I was prepared, for on talking over Rose matters with one of our most successful growers the night before, he stated that out of 25,000 standards he could hardly find 7 per cent. of good blooms. It was not the frost that had affected them, but the cold searching north-east winds; but nothing of this kind was to be seen in Mr. B. Cant's stands, especially in his trebles. Indeed, he and his nephew and neighbour Mr. Frank Cant, seem as if they were destined this year to share the honours of victory between them; they run a neck-and-neck race, and where one is first the other is pretty sure to be second; and thus they tend to keep up the right for their old city, considered to be the metropolis of Rose growing. Some may attribute this to the character of the soil, and some to the situation, but, whatever effects these may have, there can be no doubt that in both cases skilful cultivation and judicious treatment have a great deal to say to it.

There were two Roses which came out grandly on this occasion, and both, let us rejoice to say, home-raised flowers: one was the Cleopatra already alluded to, and the other Margaret Dickson, the grand flower raised by Alex. Dickson & Sons. Mr. B. R. Cant's stand of twelve of this variety was exquisite, and the flowers contained in his 48's and trebles were equally fine. I have heard complaints of this Rose being much given to mildew, but I have not found it so in my own garden, while its grand sturdy foliage makes it conspicuous. It cannot be called a white Rose, for it has a delicate flesh-coloured tint in it; but for a light-coloured, or nearly white Rose, it has few if any rivals. Mrs. Paul holds a conspicuous place in the same class, and was well exhibited in Mr. B. Cant's 48's. His flowers, too, of Madame Suzanne-Marie Rodocanachi, Gustave Piganeau, Count de Raimbaud, and General Jacqueminot were very fine.

Clara Watson, to which I have before drawn attention, was exhibited by Mr. Geo. Prince, and was much admired; and although not considered a gold-medal Rose, was unanimously awarded a card of commendation; it will, I believe, be a desirable early-flowering variety.

Garden Roses, and Roses for decorative effect, were shown in considerable numbers, and formed a very attractive feature of the exhibition; the period of the year is more favourable to them that the later date of the Crystal Palace, and the exhibits of Messrs. Cooling & Son, Paul & Son, Mount and Mattock among nurserymen, and those of Mr. Cuthell, were remarkable for the variety and the beauty of the flowers exhibited, while Mr. Geo. Mount's tasteful arrangement seemed to me to be worthy of the first place; but then this is a matter in which taste goes so far, that opinions are pretty sure to widely differ. Mr. Mount seemed to me to give a true interpretation to the term garden Roses, by including not merely the smaller varieties of Teas and Noisettes, but also some of those Gallicas, hybrid Chinas, &c., which used to form the glory of the garden in former days before the advent of hybrid perpetuals and the splendid Teas and Noisettes which we at present have. There was a stand of Lord Penzance's new hybrids and Sweet Briars, showing how wide is the range of colour which has been introduced into this section; but unfortunately I hear that there are a good many people who talk a great deal about the old-fashioned Roses, but whose admiration of them does not lead them to introduce them into their gardens. *Wild Rose.*

[Our report of the Crystal Palace show will be found on p. 44. Ed.]

New or Noteworthy Plants.

GASTROCHILUS ALBO-LUTENS, *Baker, n. sp.**

This is another of the small Scitamineæ with variegated leaves, which has just flowered at Kew for the first time, and proves to be an undescribed species. It resembles in habit the two species of the same genus which have been figured in the *Botanical Magazine* (G. pulcherrimus and G. longiflorus), but the flower is smaller, with a flat white labellum, keeled with bright yellow. It is supposed to have been collected in the Andamans, by Mr. Man (who must not be confounded with our old friend Gustave Mann), and sent to Kew in 1889. Gastrochilus is hardly worth separating as a genus from Kæmpferia.

Leaves two to a tuft, petiole erect, deeply channelled, 3 to 4 inches long; blade spreading horizontally, oblong, glabrous, 4 to 5 inches long, dark-green on the face, with a whitish keel, plain pale green on the back. Flowers, 2 to 3 to a tuft, produced in the centre between the petioles of the leaves, radical. Corolla-tube white, cylindrical, 1½ inch long; lobes three, standing forward, lanceolate, white. Upper staminodia, shorter than the corolla-lobes; lower (labellum) flat, broad, oblong, ¾ inch long, ½ inch broad, white, with a bright-yellow central keel and faint purple veins. Stamen and style shorter than the corolla-lobes. *J. G. Baker.*

Senecio kleinioides, *Oliver & Hiern.*

Messrs. Dammann & Co. have introduced this from the Mountains of Abyssinia, and flowered it. It is clearly allied to the old well-known Senecio (Kleinia) ante-euphorbium, which is now ascertained to be a native of Tropical Africa, and is figured in the *Botanical Magazine,* tab. 6099. S. kleinioides has rather smaller heads than S. ante-euphorbium, and the leaves are flat and obovate-cuneate. A full description will be found in the third volume of Oliver's *Flora of Tropical Africa.*

Plectranthus marrubioides, *Hochst.*

Another curious plant which Messrs. Dammann have introduced from the mountains of Abyssinia, is the above. It has dense clusters of very small white flowers, forming long spikes, and small crowded very fleshy opposite obovate-cuneate sessile leaves. Full descriptions will be found in De Candolle's *Prodromus,* and A. Richards' *Flora of Abyssinia. J. G. Baker.*

Nemastylis brunnea.

This curious little Irid, received from Mr. Van Tubergen, of Haarlem, is now in flower in a pot in my greenhouse. Its foliage closely resembles that of a Tigridia, and its flowers, which are unfortunately fugacious, like those of most, if not all, of its family, are freely produced in bunches of from three to seven, are pendulous and round, and cup-like in form, of a pale purplish-rose colour, consisting of six segments each; the three alternate ones are tipped with clear yellow, and are slightly reflexed. The marking of the centre of the interior of the flower is most distinct and curious, being a well-defined equilateral triangle of pure white, edged evenly all round with a narrow purple line. The flowers last but one day. *W. E. Gumbleton.*

* *Gastrochilus albo-lutens,* Baker n. sp.—Acaulis, foliis binis distincte petiolatis oblongis viridibus glabris, facie albo carinatis, dorso pallide viridibus; floribus 2—3 centralibus radicalibus; corollæ tubo cylindrato albo sesquipollari, lobis lanceolatis porrectis; staminodiis 2 superioribus oblongis corollæ lobis brevioribus, labello plano late oblongo venis purpureis, carinâ lutea.

A SOUTHERN FERN PARADISE.

Looking up the literature on insular floras of the New Zealand region the other day, I came across an account of the vegetation of Stewart Island, New Zealand, which so charmed me that I thought it might be worth while reproducing the substance of it, especially as it is in a publication found in comparatively few libraries.* Stewart Island, or South Island, as it is called in the older maps and books, is separated from the main island by the comparatively narrow Foveaux Strait, and is traversed by the 47th parallel of latitude. It is very hilly, or even mountainous, one might say, for there are altitudes of over 3000 feet, and the area is estimated at 640 square miles, or less than half the size of the county of Sussex. Several botanists have visited the island within the last decade, but it is to Mr. Thomas Kirk that we are indebted for the exceedingly interesting description, from which the following particulars and extracts are taken. With regard to the position of the island, in about the same southern latitude as the mouth of the river Loire in the northern hemisphere, it may be explained that in a general way, parallel for parallel, it is colder in the southern hemisphere than it is in the northern, especially in somewhat higher latitudes than Stewart Island. Thus, South Georgia in 54° 30′ S. lat., corresponding to the position of the Isle of Man, has an absolutely arctic climate But Stewart Island must enjoy an exceptionally mild climate for its situation.

Before proceeding to the Ferns, a few words respecting the general composition of the flora. Up to the date of Mr. Kirk's report, 380 species of flowering plants, and about seventy species of Ferns and Lycopods had been collected in the island. The woods present a striking difference from those of the northern hemisphere, in consequence of the brilliant colours of the flowers of some of the trees. Metrosideros lucida, one of the commonest trees in the island, is a perfect blaze of crimson during the months of December and January; to which Olearia angustifolia (Compositæ), offers a striking contrast, in its deep green glossy leaves and snowy-white and purple flower-heads. There are several other handsome arboreous Compositæ, including Olearia Colensoi and Senecio Muelleri. Ground Orchids are a conspicuous feature in some parts of the forest. Corysanthes oblonga, C. rivularis, and others produce their attractive flowers by thousands, and Mr. Kirk states that he has nowhere else seen these interesting plants in such profusion. Epiphytal Orchids are also well represented by Earina mucronata, E. autumnalis, and Dendrobium Cunninghamii. Sarcochilus adversus is rarer.

Mr. Kirk describes the composition of the vegetation of some of the most attractive spots in this charming island. The following is a specimen:—

The "Archdeacon's Cove" is a delightful nook on the south-eastern side of Paterson's Inlet, and can only be approached by water. On stepping out of the boat the visitor observes luxuriant plants of Lomaria dura and L. Banksii, but for some time sees no indication of the rich treat awaiting him. Proceeding for a few chains along a narrow creek, Lomaria capensis is found in great luxuriance, and

* The Transactions and Proceedings of the New Zealand Institute.

almost suddenly daylight is diminished by the narrowing width of the ravine and the increasing height of the cliff; all being overshadowed by a dense growth of gigantic forest trees, thickly clothed with epiphytes, so that the direct rays of the sun are excluded, and a constant drip falls from the branches. The eye is bewildered by the multiplicity of Fern forms, which emerge from the partial obscurity as it becomes accustomed to the diminished light. High up amongst the branches of an inclined trunk hangs a pale green mass, which seems strangely familiar, but which from its large size fails to be recognized until a tedious climb of the wet slippery trunk reveals it as Hymenophyllum pulcherrimum, with fronds between 2 and 3 feet in length. H. bivalve, H. multifidum, and many other congeners whose names need not be given, are found on adjacent trees, while H. dilatatum exhibits great luxuriance at their base. Presently the gully widens out, and numerous Tree Ferns are to be seen; but the glory of the gully consists in its grand specimens of Todea hymenophylloides and T. superba, both of which are plentiful, but the latter especially exhibits its most graceful habit and its most luxuriant growth. From a stout stem some 18 inches high a dense crown of nearly erect fronds, with drooping tips, is given off. They may be counted by scores; some of them are three years old, and between 4 and 5 feet in length, of a deep blackish-green. It is impossible to conceive of a more attractive Fern than this, or of a greater contrast than is presented by the same species when spreading its yellowish-green fronds in open woods. Numerous specimens were observed, but only one exhibited the extreme beauty or attained the large dimensions stated."

And now a few words concerning the wonderful Fern vegetation of Stewart Island. In no other temperate region in the world, probably, is there so large a number of species in so small an area. I have already mentioned that the Ferns and their allies the Lycopods number about seventy species; but there is no species of Selaginella. The Ferns include no fewer than four arboreous species, namely, Hemitelia Smithii, Alsophila Colensoi, Dicksonia squarrosa, and most unexpectedly, Cyathea medullaris, though the last is rare. The Hemitelia is spread all over the island, and sometimes attains a height of 25 feet; but Dicksonia squarrosa is the most abundant of all, forming groves covering many acres under large trees. Indeed, Mr. Kirk states that Tree Ferns are abundant alike on the outskirts of the forest and in its deepest recesses, and often occurring in large masses, especially unsheltered, where they frequently rise above the level of the surrounding shrubs, and produce an effect rarely seen elsewhere in New Zealand. In some localities the trunks of the Tree Ferns are clothed with various species of Hymenophyllum, H. æruginosum being especially abundant. Dicksonia antarctica has not hitherto been found in Stewart Island; and Mr. Kirk mentions half-a-dozen other Ferns which, he thinks, may yet be found. Filmy Ferns flourish here, as they do in few countries. Out of twenty-seven species found in the whole of New Zealand, twenty are known to occur in Stewart Island—that is to say sixteen species of Hymenophyllum, and four of Trichomanes. On the other hand, Adiantum affine is the only representative of its genus, and that is rare. Three species of Gleichenia are recorded, and G. dicarpa is said to be abundant. Next to the abundance of tree, Mr. Kirk states, the most striking feature in the Fern flora is afforded by the numerous varieties of Asplenium bulbiferum, A. obtusatum, A. falcatum, and A. flaccidum. Many of these varieties are very beautiful and attractive, but they merge into each other by such minute gradations that it is often difficult to determine the species to which they should be referred. Mosses, foliaceous lichens, and Liverworts also abound, clothing the trunks of trees and the ground where it is not covered with other things. Altogether Mr. Kirk's sketch of the vegetation of Stewart Island makes one long to see such a natural Fernery; yet one feels glad that it is not within an easy distance of London! *W. Botting Hemsley.*

DISA × LANGLEYENSIS

(TRIPETALOIDES × RACEMOSA).

Our illustration (fig. 5) affords a representation of Disa × Langleyensis, raised by Messrs. Jas. Veitch & Son, Royal Exotic Nursery, King's Road, Chelsea,

Fig. 5.—DISA × LANGLEYENSIS.

and since in the Royal Gardens, Kew, where, together with the other Kew hybrid Disas, it forms one of the most attractive features at the present time. The chief agents in these were Disa tripetaloides, introduced by Mr. J. O'Brien from South Africa, and illustrated from a specimen supplied by him in the *Gardeners' Chronicle*, June 21, 1890, and D. racemosa, which was illustrated from a specimen obtained from the same source, in the *Gardeners' Chronicle*, May 12, 1888. Both these species are beautiful in themselves, and when intercrossed with D. grandiflora, as they have been by Messrs. Veitch, and at Kew, a new race of free-flowering, elegant, magenta, rose, and pink Disas have resulted, and still more beautiful additions are in store.

Orchid Notes and Gleanings.

LÆLIA TENEBROSA.

For some weeks past we have been receiving flowers of this fine Lælia, and have had an opportunity of seeing the extraordinary variation in the flowers of the different plants. The greater part are of average merit, but some are very fine and distinct novelties, which will doubtless always be valuable. Two of the best are a very large and dark-coloured variety, approaching the Tring Park variety of Lord Rothschild's collection, received from Joseph Broome, Esq., Sunny Hill, Llandudno. Its fine sepals and petals are of an uniform brownish Indian-red, the lip light rose, with maroon-crimson and purple lines in the tube, and extending into the rose of the front portion—a most beautiful and striking form. The other, from W. M. Appleton, Esq., Tyn-y-Coed, Weston-super-Mare, has light yellowish-buff sepals and petals, and blush-white lip, with purple lines at the base, the two, both very handsome, presenting the most dissimilar colouring we have yet seen in the species.

Cypripedium Calypso, *Reichenbachia*, t. 77.

A hybrid out of C. Spicerianum by C. Boxallii. It resembles C. Boxallii, except in the dorsal sepal and staminode, both of which are strongly stamped with the characters of C. Spicerianum. It is a winter-flowering plant.

Masdevallia Chimæra var. Mooreana, *Reichenbachia*, t. 78.

"A fine form, with the ground deeper yellow than usual." A span-roofed cool Orchid-house, with a minimum temperature of 50°, is found to be best for these plants.

Miltonia Phalænopsis, *Reichenbachia*, t. 79.

This plant "stands as a memorial that the perception of the gardener is not always less worthy of consideration in the matter of a plant name, than the opinion of a botanist." Of course it is not. The gardener has often much better materials and opportunity than the botanist. If the gardener happen to be a botanist also his opinion is doubly valuable.

Lissochilus giganteus, *Reichenbachia*, t. 80.

"Among the most noble and stately of terrestrial Orchids, the place of honour should be awarded to the glorious Lissochilus giganteus, the Cattleya of the East."

The Duc de Massa, who grows this plant very successfully, uses a mixture of fibrous leaf-soil with a little cow-manure, which has always to be kept moist. The plants are grown in large tubs or pots with thorough drainage, and in the summer months are placed in the tank of the aquarium with the base of the pots or tubs sunk to the depth of a few inches in the water. In the autumn they are moved into the Vanda-house, where they remain during the winter in a shallow basin, with just sufficient water to provide a slight moisture to the roots.

HARD-WOODED GREENHOUSE PLANTS.

(*Continued from vol. xv., p. 779.*)

Darwinias.—This fine genus of New Holland plants is better known perhaps under the older name of Hederoma, which still clings to them in gardens, or under the still older one of Genetyllis. It was under this latter name that I first became acquainted with D. macrostegia, or as it was then called, Genetyllis

tulipera; that was at the then well-known nurseries at Kemp Town, Brighton, about the year 1860, just prior to that business being taken over by the late Major Mackenzie of Epping Forest. At that time the hard-wooded Ericas and other specimens, now rarely seen, were a fine feature in that establishment. The plant in question had been grown into a good half-specimen, which, considering it was only introduced in 1854, was not a bad achievement. I may be mistaken, but it has been my impression that this species of Darwinia as I then knew it, had flowers of brighter colour than those usually seen. This may have been caused by the situation and proximity to the sea, the latter having a tendency in a most decided manner of producing this result in some instances.

D. macrostegia is much the finest variety in cultivation, no other variety can compare with it in colour or size of flower. Its habit leaves nothing to be desired, whilst its blossoms last too long rather than otherwise, with a weakening tendency to the plant if persisted in. As a decorative greenhouse plant of hard-wooded growth it must be classed with the very best in cultivation. It is still to be seen at exhibitions in May and June, although not always in the best possible condition. A very fine plant of large size was presented at the recent Crystal Palace Show by one exhibitor, whilst another staged a well-managed half-specimen; these were both flowered well, showing the plant in its best character. The keeping properties of the flowers have already been alluded to; exhibitors of course do not like to pluck the blossoms whilst a plant can be made to do still further service, but in this they make a mistake.

For instance, to show the same plant in May, June, and July is expecting too much, consequently the next season there is a sparsity of flower. This has frequently resulted in a plant only being flowered well once in two years, but with good management this need not be the case, a fair average amount of flower every year being better than a greater profusion in alternate years. The best remedy for this is to pick off the flowers as soon as they lose colour, which will be some little time before they entirely give out. If they last in good condition for six or seven weeks when once they are fully expanded, that ought surely to be long enough, considering that for some little time previously they have been very interesting during development. When the flowers are picked off, the plant should be treated to a good syringing, with a little sulphur added to the water, in case of any red-spider having formed a colony. Thence onwards during growth it is best to keep the plant under glass, so as to encourage its free and speedy completion. A cold pit of sufficient depth would be a better place for five or six weeks than a freely-ventilated greenhouse; the moisture in the former case would encourage growth, it being possible to control this better than in the latter. In any case the syringe can be used with advantage, just as in the case of an Indian Azalea when in this stage. A close atmosphere must be guarded against; this would cause elongated and spindly shoots.

When the growth is fairly well completed, the plant may be stood out-of-doors in favourable localities until the first week in September, still employing the syringe during hot weather. Where the position outside is none of the best, a light part of the greenhouse would be preferable. When starting with a young plant, which is much the best plan, there may be a tendency for some shoots to take the lead. This should be stopped by merely pinching out the points of such shoots to encourage lateral growth, the chief aim for the first season or two, being to lay a good foundation. Afterwards, some stopping may be necessary, but in any case it should be done in time for the wood to become well ripened. Over-potting should be guarded against, for if once a plant becomes soddened and sour at the roots, there will be trouble in store. Moderate shifts in alternate years will be quite sufficient for a plant that is increasing in size. Specimens needing far less, provided the soil is in good condition, these might be slightly reduced at the root, so as to again use the same size of pot. The soil best suited to this and other Darwinias, is peat of the most enduring quality, such as one would select for the finest of the Cape Heaths. There should be no suspicion of its soon turning sour or becoming at all of a soapy character. Dark-looking, hard-handling peat is the best; but when it does not come up to this standard, I would add a little light yellow loam, which when all is made firm in the pot, as it must be, will remain for a longer time in good condition. I have noted one thing in Darwinias as compared with other hard-wooded plants; this is a preference for rather more sand, which should be of the coarsest kind, failing which, I would add broken crocks powdered down finely. Watering must be carefully attended to, both extremes being avoided, this plant being as impatient on the one hand of drought as on the other of too much moisture; but by striking a medium course the advantage will be apparent. When stored or housed for the winter, see that the plant is not crowded by other things, so as to weaken its lower branches, and avoid too damp an atmosphere at that season.

D. Hookerians, or, as it is better known in gardens, D. fuchsioides, is of the two, more profuse in flowering than D. macrostegia, being slightly earlier also. It is quite distinct in colour, being of a pale reddish shade throughout. In growth it is more slender, but is sufficiently bushy to form a good plant without much support from sticks. It should be grown wherever D. macrostegia also finds a congenial home, being quite distinct from it in every way. The *Dictionary of Gardening* states that it much resembles the other, but I fail to see this entirely. D. fimbriata is a later introduction, from the Swan River district of South-west Australia; but it does not appear to have ever gained in popularity, although it is quite distinct from both of the preceding. *James Hudson.*

(To be continued.)

A VISIT TO LANTAO.

Lantao is an island belonging to China, at the mouth of the Canton River, between Hong-Kong and the Portuguese settlement Macao. From the sea, it looks like a rugged barren mountain ridge, with numerous peaks, some of which rise 3000 feet above sea-level. The fertile spots are the ravines, and these run from the top of the ridge, sometimes almost perpendicularly, at other times sloping gradually, to the shore. In these places are to be found many rare plants. The object of our visit was to procure some specimens of Rhododendron Fordii, which makes its home at the top of one of the ravines at an altitude of 1600 feet. To climb such a height at home in the winter time would be a warm task, so that you may readily imagine what it was like with the thermometer standing at nearly 80° F. in the shade. It was impossible to go up the ravine, on account of the many large rocks and shrubs which were in the way; our only method of ascent was by a roundabout way up the hillside. We accomplished the task with considerable difficulty, after climbing for two and a-half hours. As long as we had a grass-cutter's path to follow, travelling was fairly easy; but after we had left this far behind, we had to assist ourselves in the upward journey sometimes by catching hold of the grass above us, and at other times the ledges of rocks. All our trouble was well repaid, however, for when we reached our destination, there, in the dense mist which prevailed at the time, was Rhododendron Fordii in hundreds, some in bud, the buds of a most brilliant pink; others in full flower, some flowers white, others suffused with pink, growing in the crevices of vertical rocks, with hardly a vestige of soil, and thriving under exactly the same conditions as Cœlogyne imbricata and Pholidota chinensis. The sight was one not easily to be forgotten, and our only regret was that the whole horticultural world could not see it.

The plants varied in height, from a few inches to 8 or 9 feet, and those which were 18 inches high and upwards were, or would be, one mass of bloom. The flowers are 2½ inches across when fully expanded, and are produced in terminal heads of half a dozen or so. The buds are enclosed in glutinous bracts, but many of these drop off as the buds open. The length of the corolla is about 2 inches, the colour on opening being white, suffused with a lovely pink, the upper lobe being marked with carmine and purple blotches. The flowers turn nearly white after having been open for some time. The leaves are very coriaceous, dark green and shining above, and covered with a rusty tomentum underneath. They are 3 or 4 inches long, and about 1 inch wide, on petioles of ¾ inch. The plants in bud are, I think, even more showy than those in flower, which is saying a good deal. In close proximity to the above was a plant of Rhododendron Westlandii, 10 feet high, and which, heretofore had not been found in the same locality. It was nearly past flower, but from the few flowers which remained, it was seen to be a good thing, but not anything like so striking as R. Fordii. The flowers, so far as I was able to judge, are white tinged with purple, the upper lobe of the corolla being marked with pink spots. Two other Rhododendrons were also growing within a few yards of the two noted above, R. squamatum and our old friend R. indicum or Azalea indica, as it is more generally called. The flowers of R. squamatum are of a light purple, which clashes with most other colours, but when they show up against a green background, as they did here against the green foliage of other shrubs, they looked remarkably pretty. Some of the plants were 4 feet high, and literally one mass of flowers. Amongst other flowering plants in the immediate neighbourhood, were the following: Schoepfia chinensis, a shrub 3 or 4 feet high, which was in fruit, its scarlet-oblong drupes making it rather showy. This makes a pretty plant when in flower in February; the petals are salmon-coloured, ½-inch long, four to six in number, united, forming a tabular corolla. Symplocos decora—there were several plants of this, 4 or 5 feet high; the flowers are white, very sweet-scented, ½-inch across, produced in axillary racemes. This plant grows to a much greater height in Hong-Kong, as there are plants in the Botanic Gardens quite 20 feet high. On the hills, however, it has become exceedingly scarce, in fact, so far as I know, there is only one wild specimen in the island. Enkianthus quinquevulnerus was still (April 4) in flower, although the beginning of February is its usual time for flowering. It is a great favourite with the Chinese, whose zeal in the acquisition of the shrub is often the means of their appearance at the local police-court, much to their discomfiture. Begonia laciniata was growing on the bare rocks, and had just started to put forth its new leaves; these were dull crimson underneath, and green above, the whole plant being covered with hairs, but more especially on the veins of the leaves. Indigofera venulosa was growing freely amongst stones, but it was too early in the year for it to be in flower, as it flowers in May; it grows to the height of a foot or 18 inches, and bears lilac-coloured flowers. Myrsine capitatella, Turpinia arguta, Asparagus lucidus, and Viola diffusa, were amongst other plants in flower. Of Ferns I noticed Aspidium auriculatum in hundreds, Aspidium aristatum, Gymnogramma decurrens, Polypodium lingua, Acrostichum repandum, Pteris aquilina, Pteris semi-pinnata, and Davallia pedata, the latter making itself at home on the rocks. The natural order Lycopodiaceæ was represented by Lycopodium involvens and L. flabellatum. On making the descent, there were many plants to attract one's attention. Brainea insignis was rather common, many of the plants being good specimens, with trunks 3 feet high. Cæsalpinia vernalis, a stout climber, armed with numerous recurved prickles, and bearing large racemes or panicles of golden-yellow flowers, was smothering less robust plants. The sight of Rosa sinica in flower is one ever to be remembered; there were dozens of plants, with hundreds of blooms open on every one, climbing over small trees and shrubs. The flowers are pure white, fully 3 inches in diameter, solitary at the ends of the lateral branches, and these showed up remarkably well

against the shining dark green foliage. The Weather Plant (Abrus precatorius) made itself noticeable, with its beautiful little seeds. These are oval in shape, not more than the eighth of an inch in length, black at one end, and brilliant scarlet at the other. Stauntonia chinensis was past flower, but its light green foliage made it very striking. Euonymus laxiflorus, a shrub of no particular beauty, but rather rare in Hong-Kong, was met with in several places. Gmelina chinensis, another rare Hong-Kong plant, was represented by several specimens 5 or 6 feet high; under cultivation, however, it attains a height of 16 feet at least. Other plants noted on the way down were Blechnum orientale, Gleichenia dichotoma, Lonicera macrantha, Pittosporum glabratum, Raphiolepis indica, Lygodium scandens, L. japonicum, Sterculia lanceolata, Gynura pseudo-china, and Rubus parvifolius, all of which are common. Pinus sinensis had apparently been planted rather extensively, but none of the trees were very

Fig. 6.—Iris germanica: five-parted flower, from a drawing by Mr. Harrison Weir.

big; the tallest, I should think, were not more than 12 or 15 feet high, and judging from the number already felled, it looked as if those standing had not long to remain. As soon as a tree is big enough to make firewood, nothing will prevent a Chinaman from cutting it down, with the exception of the restraining arm of the law. On reaching the lower levels, Azolla pinnata was noticed to be rather plentiful in pools of water, of a beautiful metallic hue, owing to exposure to the sun. Crinum asiaticum was growing luxuriantly near the sides of streams, and Plumbago zeylanica, in flower, was thriving in moist and shady places, in company with Fragaria indica. Two Composites, with yellow flowers, met with were Senecio Stauntonii and Wedelia calendulacea. The former was trailing over shrubs, and the latter creeping along the ground, rooting as it went. Adiantum flabellulatum was doing remarkably well on old walls, but was not seen elsewhere; whilst Adiantum caudatum was not at all particular as to situation. Close to one of the villages Ricinus communis was met with in abundance, but I have never observed it away from the haunts of men. *W. J. Tutcher, Hong Kong.*

Amateur's Column.

Iris germanica.—It is now nearly thirty years since I began to collect some of the varieties of Iris germanica, many of which are still the most beautiful, though I have added to their number of late years. This year a disease has appeared and killed several of my most thriving plants. One large clump of aurea, full of bloom, just showing the colour, was struck, as it were, in a night, it having the appearance as though scorched, and so with a few others. I tried several methods to save them, but none availed, and they are dead, or very nearly so. I have not seen the disease before, and I hope and trust that I may never do so again. With these exceptions, I have never had such wonderful flowers, both in size, form, and colour. In some instances they consisted of four standards, and four falls. In another there were seven standards and four falls. While one, the old Rose Queen, now called Queen of the May, a lovely bright light pink "beauty," produced one flower with five standards, five falls, and five petaloids, and yet in all these respects was well proportioned. This form being new to me, I made a drawing for the *Gardeners' Chronicle*, thinking possibly it might prove of interest to some of its readers.

While on the subject, I wish to remark that I know of but few florists' flowers where so many different names are given to apparently the same flower. I commenced the culture of Iris by buying about fifty sorts or varieties of Mr. Salter, of Hammersmith, years ago, and I now find several of these have another name, and some more than one, newly bestowed on them. What I have grown as the Duchess of Buccleuch, a fine purple and white blotched variety, is now called Victorine; the old Abou Hassan is Louis Van Houtte, &c.; and Goldfinch is Prince of Orange; yet I intend to call them by the names I have known them by, and were given to them by their skilful raiser, Mr. Salter.

As I have had a long experience, perhaps I should not be considered trespassing too much on your space if I give the names of a few of the most distinct. Among the dark purples, I have thought subbiflora, nepalense, Crimson King, and germanica major the best; of whites, Mrs. H. Darwin is the most beautiful, then the Princess of Wales, Innocenza, and Florentina; the last has been grand this year. Of white with blue and lilac edgings, Celestine is delicate in form and colour, but both Madame Cherian and Saladin are excellent—in fact, it is difficult to decide which is the best. Othello is more than a good dark one, the standards being a bright blue, and the falls nearly black. In this way is the Emperor of Morocco, but lighter. Of the white striped with blue, Zebra is the most singular, the standards, falls, and petaloids all being striped; next is Salter's Zebrina, the standards being soft lilac, spotted at the base, and the falls striped; the last variety of this is a seedling, with the standards white, and the falls striped with deep blue-purple—this is very telling, and is named J. Jenner Weir. Of the yellows, flavescens as a light colour still holds its own, while aurea is unsurpassable as a bright yellow. A new one of mine, named Gold Crest, is very good, the standards and falls being chromey-white, edged with deep yellow, with a few light purple blotches on the latter. Salter's Gipsy Queen is peculiar, the standards being a yellowish-grey, the falls deep blue-purple, reticulated, white. His Jacquiana is lovely, the standards are of a light orange, shaded with carmine, and the falls a deep carmine-purple, the beard cream. I raised a seedling from this about fifteen years ago, the standards being light crimson-sulphur suffused with blue, the falls a deep bluish-purple, reticulated with white at the base, with orange beard; the flower is large and fine in form, and is called Harrison Weir by Mr. Barr. I have two very beautiful veined varieties, raised by Mr. Salter, of the squalens type; one is Venus, the other Venosa. I have raised a third; this is a soft fawn colour, the falls being slightly suffused with pink, named Fallow Deer. Goldfinch is lovely, standards and falls deep yellow, the latter reticulated with bright red. Lady Jane is a reddish-pink, well worth growing, as is Miralba, of a similar colour. Cordelia is one of the most beautiful, and is remarkably rich in colouring of the red-purple type, with reddish-lavender standards. Darius is fine, so is De Bergii. Iris pallida is a large light blue, while pallida dalmatica is grand in size, colour and form, being one of if not the largest of all, it is also sweet-scented. All these are good, and will well repay the grower for any time or trouble he may take or expense he may incur, and not only be a delight to himself but to his friends also. *Harrison Weir, Sevenoaks, June 23.*

The Fruit-Tree Spraying at Cambridge.

When the great British Public see that a machine has won a silver medal in a competition at any trial of the Royal Agricultural Society, they think that the machine is worthy of inspection. For instance, recently, the uninitiated doubtless imagined the spot chosen for the above trial most suitable, and the judges to be experienced, in fact, everything combined to give a genuine test of the merits of a tree-spraying machine. I was one of the simple crowd when I journeyed forth from Cambridge to Mr. Ridgwell's farm, Histon Road, to see the best machines spraying the trees in the most up-to-date manner, judged by a man selected by our great Agricultural Society; but I no sooner arrived than the process of disenchantment commenced. The trees were not the most suitably cultivated to show the advantages of any engine. As far as bush-fruit was concerned, the owner wisely objected to have his crop spoiled, so there were no bushes to spray. The only one on hand was the chairman of the Strawson Company, who had exhausted stock in witnessing the attempt made to spray Potatos in a field adjoining. Having suffered disappointment with the site and judge, I buoyed myself up with the hope that those who exhibited tree-washing machines, would be experts at the business. A bull in a china-shop is thought to be in the wrong place. A cow with a musket is thought a trifle awkward, but to see some, in fact, I may say nearly all the exhibitors (except Messrs. Stott's representatives, Mr. A. H. Stott and Mr. C. Payant) begin to show the judge how to wash a tree was curious. It was evident their previous experience had been gained at the Royal Horticultural and other shows, and not by having to do the work. Many judges would have condemned the machines from the faults of those who endeavoured to show

*

their points. Luckily, the judge did not notice the faulty way the washing was carried out. Thirteen machines were on the ground, the competitors numbering five. Stott fertilisers began the contest with a 30-gal. engine, with all necessary extras, to wash any orchard. The way this machine was handled won the admiration of all, and showed great technical skill on the part of the operators. Next came Weeks' horse machine, which had no chance of exhibiting its use from the natural disadvantages of the spot. The trees were too closely planted. After Weeks', came Boulton & Paul of Norwich with a 30 gal. engine; the beauties of this machine may be great, but those that handled it showed a great desire to water the roots and not to spray the foliage, if the time they took to each tree is any guide. The Syphonia and Strawsons, Limited, followed, with knapsack appliances, both excellent for window gardening or washing, but for extensive work are unsuitable. The sulphurizers of Weeks and Strawsons were also given a trial, for the latter there was nothing to apply the sulphur to, and to the former the remarks made as to their fruit-washers apply; it is absolutely necessary with horse-power sulphurizers to have large enough area, and suitable subjects to sulphur. The contest for tree-washers was severe, and the result was in doubt for some time—why, no one could understand. Boulton's machine that took the prize required dragging to each tree to be sprayed, its wheels were too small for work on any plantation cultivated as it would be by any man who had sense enough to wash his trees—in fact, the wheels are only fit to run on asphalte walks in a garden, while Stott's had large wheels, could be stood in one spot, and the trees around for 60 feet sprayed without moving the machine, and had an apparatus that enabled raw petroleum to be applied with water. This is an advantage that growers who have bought petroleum emulsions, costing 5*s*. per gallon, will not require dilating upon. The raw material can be bought, as all know, at 5*d*. per gallon, and used with the greatest safety. In spite of all these advantages, Messrs. Boulton's machine won. It must be some satisfaction to the losers to know the victors used Stott's nozzles, and that the manner in which their own machine was entered in the catalogue contributed to their defeat. I hear the catalogue price of the losing machine, which was quoted complete with every appliance for washing any variety of tree and bush, and had 60 feet hose, two patent copper distributors, and two long branches for lofty trees, with six sprayers, was £20, while the winning machine had only a length of hose of a few feet for spraying purposes—in fact, it might be considered as complete for real work as pigeon-pie without the pigeon. I went to this trial to learn how tree-washing was done by exponents of the art, as I have seen some little of it done by the commoner garden operators; also to see the way the machines were tested to bring out their practical points. I left, wondering if I stood on my head when I heard there was a doubt in the contest; I did so when I heard the result. Great are the ways of agricultural demi-gods. May I never be judged by them is the prayer of your correspondent. *Outside.*

ANALYSIS OF FRESH FIGS.

The growing importance of the Fig industry in California demanded that special attention should be directed to the manurial requirements of the Fig tree, especially in its fruit production, and also as to the chemical composition of the Fig as an article of human food. Accordingly, Messrs. M. E. Jaffa and G. E. Colby, the chemists of the Horticultural Department of the Californian Station, have carefully investigated the question.

For this purpose eleven of the most important varieties of the crop of 1892 were selected and chemically examined. These included the varieties —White Adriatic, Smyrna, California Black, Hirtu du Japon, Constantine, Du Roi, Dorée Narbus, Pastelière, and Brunswick.

The following tables give the average results of the physical and chemical examination of these varieties:—

Composition of Fresh Figs.	Average of 11 Analyses.
Physical Analysis.	Grains.
Average weight of the fruits	37·70
Number of fruits to the pound	14·75
Percentage of juice in the fruit	74·35
Percentage of pulp in the fruit	25·65
Chemical Analysis.	Per cent.
Sugar in the expressed juice	21·42
Sugar in the fresh fruit	15·73
Acidity of the juice	0·14
Nitrogen in the whole fresh fruit	0·20
Albuminoids in the whole fresh fruit	1·25
Ash in the whole fresh fruit	0·62
Water in the whole fresh fruit	81·84
Dry substance in the whole fresh fruit	18 16

The juiciest fruit was the White Adriatic, which had over 85 per cent. of juice, against 74 per cent. shown in the average. The driest sample was that of the Smyrna, containing but 64 per cent. of juice.

In the whole fruit the highest sugar was found in White Adriatic; however, the juice of one Smyrna variety showed 29·9 per cent. of sugar, which, when referred to the fresh fruit, is still over 1 per cent. less than that of the White Adriatic, or as 19·2 to 20·45 per cent. Dorée Narbus and Constantine, with respectively 27·4 and 24·04 per cent. sugar in their juice, show, on account of their dry flesh, much less sugar in whole fruit, than either of the Adriatics. Another Smyrna variety showed the lowest sugar percentage, amounting to but eight parts in the hundred of whole fruit, about 4·5 per cent. less than the California Black, which gave 12·4 per cent.

The acidity of fresh Figs seems to be very much lower than that found in any other fruits.

In regard to the nutritive values of Figs as an article of food, it may be stated that the Fig rates first in flesh-forming materials among Californian fruits; Apricots and Plums second; Prunes and Oranges third.

(The writer has recent evidence of the great value of fresh Figs as an article of human food in a case of extreme prostration.)

The following table shows the mineral constituents of the Fig fruit, and the consequent requirements of the tree upon the available mineral resources of the soil:—

Percentage Ash-constituents of the Fig.	White Adriatic.	Smyrna.
	Per cent.	Per cent.
Potash	60·13	48 60
Soda	1·17	2·20
Lime	9·12	.....
Magnesia	5 32	.....
Iron oxide	0·84	.....
Manganese oxide	0·19	.....
Phosphoric acid	11·07	11·20
Sulphuric acid	4·75	.....
Silica	4 85	.....
Chlorine	2·56	.....

As to nitrogen, the investigation showed that among Californian fruits the Fig, on the whole, extracts decidedly the largest amount of this element from the soil, and therefore it is but a truism to assert that the growing plant must have within its reach a sufficiency of nitrogen to maintain health, vigour, and productiveness.

With the exception of the Grape, the analysis shows that the Fig draws rather more heavily upon the mineral ingredients of the soil, that will need to be replaced by careful manuring, than do any of the Californian fruits yet examined.

In the ashes of the Fig, as in the Prune, Apricot, Orange, and Lemon, the constituent potash is found to be the leading element, amounting to about three-fifths of the whole ash.

The Fig, like the Lemon, appears to range a little below the other fruits in its requirement of phosphoric acid, for we find the composition of the fruit ash to stand in the following order in their phosphoric acid percentages, namely, Prunes, 14·1; Apricots, 13·1; Oranges, 12·4; Lemons and Figs, 11·1.

To sum up, it may be stated that the Fig requires a soil very rich in food-material. It is also advantageous for the vitality and fruit-bearing capacity of the Fig tree to have even the lower layers of the soil abundantly supplied with soluble nutrients, so that the roots penetrating into the subsoil can be well-nourished, and made to develop vigorously. *J. J. Willis, Harpenden.*

PLANT NOTES.

CIENKOWSKIA KIRKII.

Although by no means a new introduction, this plant is rarely met with, although well deserving more general cultivation. A fine plant was observed in the Orchid-house at the Birmingham Botanical Gardens, which was flowering freely. I was desirous of looking up some information respecting this plant, and Mr. Latham referred me to the Society's library, where in the *Botanical Magazine* for 1872, I found a coloured illustration of this plant, a native of eastern tropical Africa, of the natural order Scitamineæ, the drawing being made from living plants, sent by Dr. Kirk from Zanzibar in 1871, and which flowered at Kew in that year.

The plant is of easy culture, dying down for the winter, when it should have a season of rest, and be kept dry and warm, starting it into growth again in the spring, and growing in a warm and somewhat moist temperature. The flowers are of a pale shaded pink colour veined with pale lilac, with a bright yellow long spot in the throat, and the flowers are from 2 to 2½ inches in diameter, somewhat resembling the flower of the larger-sized Achimenes.

In the Orchid-house, the very beautiful Cypripedium Rothschildianum is in flower, the blooms being of large size and richly-coloured, and so distinct. It is truly a great acquisition to the already numerous handsome species and garden hybrids we already have. *W. D.*

VERONICA TRAVERSII.

This plant is admirably adapted for growing in the front parts of shrubberies, or on rockeries, flowering abundantly during the month of July. Cuttings inserted in a cold frame, about the middle of the month of September, choosing the half-ripened growths, pulling them off with a heel, strike readily. I have seen bushes of it, 12 feet across, which, when in bloom, were a remarkable sight. *E.*

ORNAMENTAL WATER AT HARBORNE HALL.

A good example of the formation of an ornamental pond in a pleasure-ground, under some difficulties, is to be found at Harborne Hall, Birmingham, the residence of Walter Chamberlain, Esq. The pool was made ten years since, the ground being excavated for it on one side of the pleasure-ground in view of the mansion, and is 90 feet in length and 50 feet in breadth in the widest part. The Hall and grounds are in an elevated position, with a full view of the celebrated Clent and Licky Hills, and exposed to the full strength of the south and west winds. In making this pond on a subsoil of gravel, it had to be puddled with clay to the depth of 12 inches, but when the sub-soil is of a heavier tenacious nature, such deep puddling is not necessary. Its greatest depth is 4 feet, and in its formation the clay puddle was brought well up to the sides, and the turf from the sloping lawn laid over it to the edge of the water, and Tufa-stone arranged informally around the margin of the pond, and a small islet formed in the centre of the broadest part. The outline of the pond is irregular and very pleasing to the eye, and with

the large collection of bog and other plants in the pond and around the margin, it has a very charming appearance in the spring, summer, and autumn months; a huge mass of Eulalia zebrina growing near to the water being a very conspicuous object, especially when in bloom, and quite 6 feet in height and 3 feet through, planted out four years since, and is never protected.

In the formation of this pond a difficulty arose in obtaining a supply of water for it, as the pleasure-grounds near to the mansion are so much above the lower pond and springs. The surplus water from the roof of the mansion, out-houses, greenhouses, and other buildings, and the walks, had to be utilized for the purpose, and two or three collecting pits were sunk and pipes near the surface arranged from one to the other for the conveyance of the water into the pond, the sediment remaining in these pits, and with the exception of such a summer as that of last year, when some additional aid to the water supply had to be given, there has always been sufficient water in the pond, and as goldfish exist in it, the water is not unsuitable for supporting life.

This pond was made by the present gardener, Mr. Charles Bick, who has also bestowed considerable thought and care in the planting in and about the pond so large an assortment of suitable plants, amongst some not generally supposed to be aquatic or bog plants, but luxuriating under such treatment. The lovely brightly-coloured Primula rosea abounds on the margin, which, during the winter, is very moist indeed.

The following are some of the plants grown in or on the banks of the ponds and pools:—Pontederia cordata, Acorus calamus, Butomus umbellatus, Orchis maculata and O. mascula, the flag-leaf Irises in variety, Epilobium angustifolium, flourishing in the rockwork close to the water; Calla palustris, Athyrium filix-fœmina, Osmunda regalis, Bambusa Metake, 10 feet high, and 4 to 5 feet through—a grand mass; Carex riparia albo-marginata, Phlox setacea, P. frondosa, and others; Funkia Sieboldii, in masses; F. ovata, and F. albo-marginata; Saxifragas, several kinds, luxuriating on the Tufa-stone; Scolopendrium vulgare (Hart's-tongue Fern), Menyanthes trifoliata, Sagittaria sagittifolia, Nymphæa Marliacea ochroleuca, a mass of it growing in the pond; N. odorata; Villarsia nymphæoides, which has pretty yellow flowers, but the plant spreads so rapidly in the water that much of it has to be destroyed; Typha angustifolia and T. latifolia, both very striking objects, especially in large pools; T. minima is a smaller and more graceful species; Mahonia japonica, although not a bog-plant, grows freely on the margin of the pond, and is in admirable foliage, and flowers freely every spring; Cyperus longus is a very pretty-growing aquatic, and where shelter is wanted for moorhens and other birds, should be freely used; Polygonum cuspidatum, a very fine specimen of this is growing upon a small island, and is a noble object in the summer, with its strong growths, 6 to 7 feet high; Phalaris variegata grows luxuriantly near water, and is very effective; Iris pseudo-acorus; Myosotis palustris semperflorens; Caltha palustris and C. p. pleno, luxuriating on the damp margin of a pond; Gunnera scabra, with leaves 4 feet in diameter; Rheum officinale, grows 12 feet high; Polygonum Sachalinense; Spiræa aruncus, S. palmata, large patches, and flowers so freely; S. filipendula flore-pleno; S. astilboides, but this was killed last winter; Gynerium argenteum has to be protected in winter; Nuphar advena, N. luteum, Nymphæa alba, Aponogeton distachyon, which flowers from May to November; Carex pseudo-cyperus, and Sparganium racemosum.

In a lower part of the pleasure-grounds a large ornamental pool was formed a few years ago, and a good bit of rockwork at the upper portion of the pool was arranged by Messrs. Pulham & Son. Around the margin of the lower portion, large stones are placed to protect the edges of the pool from the action of the water in windy weather, and Saxifragas, Sedums, and other rock-plants, very soon cover these stones, and assist in forming a break-water for the action of the waves. At the lowest end, when the water is level with the surrounding ground, Acorus Calamus has been planted, as it breaks also the action of the waves. A somewhat rare British plant in this district of the Midlands is growing here, Carex pseudo-cyperus and Petasites vulgaris, and many other aquatic plants are found in the pond; but as there are wild ducks, teal, gargory, and other birds encouraged here, the water is kept tolerably free for them. This pond is fed from a small spring close by. At one end of this larger pool a small shed has been built over the pool for cormorants and penguins.

Around the higher sides of the pool are large plants of Heracleum giganteum, Rheum officinale, and masses of Rhododendron ferrugineum and R. Wilsonii, double-flowered Gorse, Erica herbacea, Oak, Beech, and other trees, hardy Ferns, and other plants; and growing out from the rockwork is the handsome Cistus formosus, Pernettyas, &c. *D.*

Apropos of planting aquatics, Mr. Bick, the gardener at Harborne Hall, says:—The puddled bottom of the pond offers very little inducement to root-action; it is, therefore, necessary to make some preparation for the reception of the plants. At the margin of the pond, Calthas, Iris, &c., are planted in the interstices of the rocks, using lumps of old turf free from living grass-roots to fix them. I always plant my bog plants in fruit-punnets, filling these with good loam, and surfacing the latter with clay; they are then placed in shallow water, and more loam is placed around the punnets, so as to keep the whole thing stationary. The roots soon pass through the sides of the basket, which soon rot away, and leave the plant free to ramble at will. Water Lilies and other large-leaved aquatic plants, require great care in planting, as the leaves expand before root-action takes place, the loam becoming soft mud, the plant rises to the surface, where it very soon rots. The best way to plant them is to tie the roots to large pieces of rock or bricks, then place in round nursery flat baskets, and fill up with loam, adding more brickbats to give weight; interlace a piece of rope across the top of the basket, saturate the whole with water, and then surface it with a layer of clay 2 to 3 inches thick. These precautions are absolutely necessary, or trouble and disappointment will occur. The Typhas, and other strong-growing plants, will soon fill the space allotted to them, and if not prevented, would occupy the whole of the pond. To this end the leading growths are cut off as soon as they appear; and I always use for this purpose a 12-feet long standard tree-pruner, which will reach the bottom of the pond, and remove the growths without injuring the puddle. It does not do to pull the roots up, or a leakage will probably be the result.

Villarsias, and some of the other smaller-growing species, will sometimes take possession of a pond, and these should be cut or raked out every spring, in order to give the other plants a chance to get a fair start, sufficient roots remaining always to furnish the pond during the season.

Aquatics, like most other plants, have their likes and dislikes, and some of those that grow most luxuriantly in some ponds, will only just linger in others. *Chas. R. Bick.*

NURSERY NOTES.

MR. PRICHARD'S NURSERY, CHRISTCHURCH.

On the occasion of a recent visit, I found a grand collection of choice things, all in good heart, and in the best possible condition. Evidently Mr. Prichard thoroughly understands the requirements of his numerous charges; and I may say at once, that it is one of the best kept herbaceous nurseries I have visited as regards freedom from the untidyness so frequent in mixed borders of these popular flowers.

No one collection can possibly contain the whole series of genera, species, and their varieties, which come under the heading of herbaceous flowers, as not only do they vary very much in their requirements, both as regards position and soil, but the number is so great that even the Kew collections are not complete. However, the number grown at Christchurch, and their healthy condition, is surprising. Many taking spots of colour were dotted about in delightful confusion, and I propose to name a few which appealed to my fancy the strongest. Cistus florentinus is a very dwarf form, pure white in colour, and of remarkable freedom in blooming; this and C. lusitanicus were particularly good. A very showy rock plant, or for a border in sunny aspects, was Coronilla iberica, then a mass of deep yellow. Another gem for the same purpose is Tropæolum polyphyllum, the yellow Rock Indian Cress, certainly one of the very best yellow trailers we have, and forming grand festoons or trails of deep canary-yellow. Gaillardia maxima is grown in quantity, and considered the best variety; for cutting, and for lasting properties throughout the season, it is unsurpassed. Large quantities of the scarlet Alum root are also cultivated. I have been somewhat disappointed in the blooming of this pretty Heuchera, but Mr. Prichard informs me none would occur if they were transplanted each autumn; he also says that all soils are equally suitable, and that it is one of the best plants for gentle forcing in the conservatory.

In Philadelphus Lemoinei, a very compact miniature mock Orange, we have one of the freest and sweetest-blooming shrubs I have met with; it is comparatively new, but is bound to make its way rapidly. Among several Potentillas, California and Congo were very conspicuous. The former is the largest double flower I have seen, beautiful clear lemon-yellow in colour, and very good habit. Congo is a rich brown maroon, but not quite so large a flower. A small collection of bedding Pansies or Violas was also interesting, and contained the best varieties. Orchis foliosa and O. maculata superba were in grand form, the soil evidently suiting them, and although fully exposed to sun, were the best examples I have seen. Sea Hollies, Delphiniums, Alstrœmerias, and hundreds of others must be left, but I can truly say that a look round this small nursery, with Mr. Prichard as a guide, was one of the pleasantest features of a recent holiday. *A. P.*

CARNATIONS AT BOOKHAM.

The pitching by Mr. Jas. Douglas of his Carnation-tent just on the margin of the well-known common of the Surrey village of Great Bookham, has been instrumental in creating considerable interest in the popular flower he so admirably cultivates around that locality, and well it may, considering that he has so fine and varied a collection, grown, as is the usual florist's fashion, in pots. Just now, there are hundreds of fine plants under glass, where they can be shaded, and generally so tended, as to have them in that perfection of form essential to the winning of prizes at exhibitions. Quite as many are grown out of doors. The show of the National Carnation Society is near at hand, and naturally the Bookham plants and flowers, especially some fine seedlings, are then wanted, to put in respectable appearance. Some new yellow selfs, in considerable quantity, are very full of promise; of these, Miss Audrey Campbell, having large flowers of the Germania type, though fuller, and grass of a stout, erect character; and Duke of Orleans, rich creamy-yellow flowers, large and full, having grass of a long-stemmed nature, are very distinct; Louis Philippe has similar style of growth, but flowers are of a yellow-ground Picotee, very attractive; King Arthur is a large deep scarlet-flowered variety. Waterwitch is a fine creamy-pink; The Pasha, rich creamy-buff, or perhaps terra-cotta; Cardinal Wolsey, a fine yellow-ground fancy; and many others, far too numerous to individualise here. The yellow-ground section seems to be a strong class at Bookham, and there is also a fine lot of Mr. Martin Smith's very large and attractive seedlings of the Malmaison type that Mr. Douglas is putting into commerce. Generally, however, when I looked in on the 5th inst., comparatively few plants were in flower, but about the 20th there should be a big lot in bloom, and no doubt just then the Carnation Queen will be holding high levée at Bookham. *A. D.*

THE HERBACEOUS BORDER.

PRIMULA SIKKIMENSIS.

A VERY beautiful and pleasing species is the above, when seen in flower and in good condition. Although strictly speaking this species should be regarded as perennial, it is not always satisfactory grown as such, and those who would have it in perfection must regard it as a biennial. Raised from seeds, and grown quickly to the flowering stage, it is certainly a beautiful plant; and it thrives amazingly if planted in sub-aquatic places, and where there is no fear of the plant feeling the need of moisture. In such positions the seedlings, when large enough, may be planted at 9 inches or 1 foot apart. Grown thus, in groups or colonies as large as circumstances will permit, the plants produce excellent results, and attain to more than 2 feet high. The flowers are a clear pale yellow, bell-shaped, and produced in large umbels, and have an agreeable perfume. By reason of its distinct colour and easy culture, the plant should be grown abundantly in gardens where suitable positions can be found for it, it being easily raised from seeds. By raising batches of plants at intervals, its flowering season may be considerably prolonged. Even isolated examples last a long time in flower, by reason of the large number of blossoms a single umbel contains. In the Sikkim Himalayas it is found at a great elevation, acres of wet boggy or moist land being covered with the plant. *J.*

QUEEN ANNE'S POCKET MELON.

"Cucumis Melo Dudaim (L.)."* Through the Southern States a small Melon is frequent in Melon patches where volunteer plants are almost certain to appear each year among the Musk Melons, and the opinion seems to be quite prevalent that the Vines, which resemble those of the ordinary Melon, originate from degenerate seeds of the latter.

At first very dark green, and quite destitute of grooves, but with about ten longitudinal stripes, and numerous irregular spots of lighter green—then resembling a diminutive Water Melon. The fruit, which varies in size from that of an Apricot to that of an Orange, changes to a deep orange or maroon at maturity, and the paler stripes and blotches then assume a lemon-yellow colour. Though not at all grooved, it possesses the firm wall and central fibrous seed-mass of the Musk Melons, but is gelatinous toward the centre instead of becoming hollow as is usual with the latter; and when ripe assumes an unusually pronounced Cantaloup odour. All through the South these Melons are known as "Pomegranates," though they are in every way unlike the true Pomegranate, the fruit of the shrubby Punica granatum, which is cultivated to some extent in the Gulf States. The same name has also accompanied them into the North and West, as far as Missouri and Kansas at least. Elsewhere they are said to be cultivated for ornament to a certain extent under the name of Mock Oranges, though they differ greatly from the Gourd which is similarly named.

This Melon is evidently the Melon Dudaim of French writers, and it is otherwise known as Concombre Dudaim, Queen Anne's pocket Melon, Melon de senteur, Citrouille odorante, Melon des Canaries, Pomme de Brahma, and Pomme de Grenade—the latter corresponding to its popular American name.

Notwithstanding its smooth surface, small size, and gelatinous heart, the Dudaim is to be classed among the Musk Melons, of which there are a great many forms of very dissimilar appearance, several of which, including the present, have been named as distinct species.

The Dudaim Melon is worthy of general cultivation as a climber because of the beauty of its fruits, which in this respect equal the finer Gourds. They are also very attractive additions to a dessert piece of fruit, and their value for this purpose is increased by the highly-developed Melon odour that they exhale when perfectly ripe, though to some persons this odour is disagreeable because of its intensity. As a table fruit, however, the Melon is almost worthless, for though it is somewhat eaten when over-ripe, it is neither sweet nor of pleasant flavour. At best it is made the basis of a dessert by the use of sugar and wine to impart to it the sweetness and flavour which it naturally lacks. It is also capable of use in preserves, and forms the basis of the smallest of the stuffed Mangoes, a name which is no more appropriate to it than those of Pomegranate and Mock Orange.

Related to the Dudaim, but rather to be regarded as an undeveloped netted Melon, is the other form of the Musk Melon, which is likewise destitute of longitudinal grooves, and possesses a jelly-like pulp about the seeds. This appears to be cultivated more or less extensively under the names of Mango and Vegetable Peach, mainly for use in pickling, preserving, and jellies, though when fully ripe it is more palatable than the Dudaim, and capable of use on the table if sliced, with a liberal allowance of sugar and a little Lemon or other flavouring substance. Unlike the Dudaim, it is covered with slightly elevated grey lines, generally distinct from one another, but suggestive of the more pronounced ridges of the netted varieties of Cantaloup; but it posseses the same powerful fragrance at maturity, when it assumes a uniform light Lemon colour. *William Trelease, in the Fifth Annual Report of the Missouri Botanical Garden, April* 24, 1894. *pp.* 160—162.

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. H. WHITE, *Orchid Grower, Burford, Dorking.*

INSECT PESTS. — Amongst insects infesting Orchids none is more destructive than the yellow Thrips, and warm weather is very favourable to its increase. Every cultivator should be on the alert to detect them, employing such means for their speedy extermination as may be proper. I cannot recommend any of the patent liquid insecticides, and my advice is, to let each grower use a safe kind of insecticide, according to his own ideas of what such should be. Aphides are very troublesome, infesting the young growths of Dendrobiums, Epidendrums, Masdevallias, Oncidiums, and Odontoglossums more than other species; but they are easily got rid of, by removing them daily with a small damp brush, killing them with the finger and thumb. The different forms of scale-insects which infest Aërides, Saccolabiums, Vandas, and particularly the small hard scale, chiefly found on Cœlogyne cristata, must be perseveringly sought after and removed, and the best means of doing so is first to sponge the plants with lukewarm soapy rain-water; after the plants have been sponged, they should be gone over again, and the scale removed with a bit of stick sharpened to a point, and the sponge, using this time only clean water. Among Cattleyas, and Lælia anceps and its varieties, woodlice sometimes do much harm by nibbling the young roots, and as they prefer a dry to a wet place, they may be kept under by examining the compost and catching them, after the plants have been watered; also by laying scooped out-Potatos on the damp soil, and examining these night and morning. Cockroaches should be constantly sought after and destroyed, beetle-poison being always kept about the houses.

DENDROBIUM PHALÆNOPSIS.—A decidedly fine acquisition to Dendrobiums is this species, which, when well grown, is much admired. It succeeds either in pots or shallow pans, provided they are well furnished with drainage and an open compost. To obtain sturdy growth the plants should at this season be placed in the warmest house, and thinly shaded; and as the pots become full of roots, water must be afforded in abundance, and a slight sprinkling overhead applied in the afternoon. Let each plant be examined daily for the destructive species of beetle which attacks the pseudo-bulbs of this plant, cutting off any that are affected and at once burning them, so as to prevent other plants becoming similarly injured. Whenever a beetle is discovered, examine the plants every day until the insects are completely eradicated.

MISCELLANEOUS.—Amongst plants now in bloom is Vanda teres, an Orchid that succeeds admirably when grown in a hot sunny corner of the Mexican-house, and kept well syringed five or six times a day during the season of active growth. An interesting and rare plant now in bloom at this place is Hexesia bidentata, flowers orange-scarlet in colour and very pretty, lasting a long time in good condition. It is a plant easy to grow and one that flowers freely. Its chief requirement is a place in the Cattleya-house, suspended close to the roof-glass in small shallow pans. There are three handsome Cattleyas that have just finished flowering, viz., C. Aclandiæ, C. Schilleriana, and C. superba, which should now begin a short rest period, suspended in a place up to the light in the intermediate-house, gradually diminishing the quantity of water, but not entirely withholding it, or allowing the bulbs to shrivel in the least degree. Here they may stay till growth recommences, when increased heat and moisture should be afforded them.

THE HARDY FRUIT GARDEN.

By T. TURTON, *Gardener, Maiden Erlegh, Reading.*

THE WATERING OF FRUIT TREES.—After three weeks of parching heat, fruit trees in bearing will be in need in many gardens, especially those with light soils, of heavy waterings at the root. The first in the row are the Apricots, the fruits being now finally swelling. Make sure that the Apricot border is made thoroughly moist to a good depth, which can scarcely be accomplished unless three successive waterings on succeeding days are given, finishing with an overhead application with the garden-hose or engine.

PEARS AND APPLES, especially Apples worked on Paradise and Pears on Quince stocks, should be thoroughly watered without delay, the more so when carrying heavy crops of fruit. Should a showery time set in, instead of depending upon the rain to supply all the moisture needed, which it cannot do in the time, thoroughly water the soil at the roots, and mulch afterwards to prevent the moisture escaping. Young trees, if infested with aphis, should also receive a good washing.

FIGS.—When the roots of the Fig are confined to a given space, and full crops of fruit are being carried, root-waterings are very much needed, once a week being not too often till the fruit begins to ripen. Even trees growing unrestricted at the root in warm borders should receive sufficient water to moisten the soil to a depth as far as the roots reach, when, with ordinary summer weather, unless the border be an exceptionally dry one, no more water will be required this season.

MORELLO CHERRY.—Trees on walls and bushes should now be examined for the last time before putting the nets on them, and if the black aphis, in ever so small numbers, be detected, dip the tips of the shoots in tobacco-water or some other insecticide, and well syringe the trees with clean water, not sparing any pains in doing so. Care must be taken to so fasten the nets and prop them out from the wall, or the fruit in the case of bushes, that the birds cannot reach the fruit. For bushes growing singly, a stout pole placed in the centre, with six others around at the extremities of the branches, will be found sufficient as a framework on which to hang the nets. It is very convenient to have short pieces of net for protecting single trees, and the following are convenient sizes: 18 feet by 12 feet, 24 feet by 12 feet, and 36 feet by 12 feet. Be sure that the trees do not lack water.

BUDDING.—The budding of Cherries, Apricots, Plums, Peaches, Pears, and Apples may be commenced if the bark runs freely, the kinds being taken in the order above given. Budding is a simple operation, and its employment is sometimes more convenient than that of grafting; and whilst it is the best method for the Cherry, Apricot, and Peach, it is also advisable in the case of the Apple, Pear, and Plum, when suitable scions for grafting cannot be obtained. For the Apricot it is advisable only where young Plum-stocks have been prepared; but with Peaches and Nectarines, other kinds, to give a succession of fruit, established trees may be budded, being careful that wood-buds only are used. The method of budding is identical with that followed with the Rose; and the budded shoots are left at full length till the winter pruning, so as to avoid any risk of the inserted buds starting to grow this year.

PLANTS UNDER GLASS.

By J. F. MCLEOD, *Gardener, Dover House, Roehampton, S.W.*

DOUBLE-FLOWERED PRIMULAS.—Plants standing in 60's may have a shift into 4-inch pots, which should be quite clean and well-drained. The best kind of soil to make use of for these plants consists of light fibrous peat, loam, exhausted Mushroom-bed dung, sand, and charcoal broken small. When repotted, stand them in a cold frame, not quite near to the glass, shade from bright sunshine, and air the plants sparingly till the roots have taken to the soil, when to ensure a robustness, the ventilation given should be liberal.

BOUVARDIAS.—Continue to pinch the shoots more or less according to the strength of the plants and of the growths, applying soot-water once a week

if the plants have not been repotted this season, which should alternate with Thomson's Vine and Plant Manure given at the rate of a tea-spoonful to a 5-inch pot, and increasing the strength of the dose as time goes on. Syringe the plants sharply twice daily, and should green-fly be present, fumigate mildly on two consecutive nights. Freely ventilate the pits and frames in which the plants are standing, but avoid shading of all kinds.

CINERARIAS. — Self-sown seedlings of good varieties may now be pricked-off into pans or shallow boxes, at 3 inches apart. This is a much better practice than potting them directly from the seed-bed, as they are not so liable to rot off if too much water be afforded them; place them in a cold frame, and shade from hot sunshine.

SHOW OR FANCY PELARGONIUMS. — Those going out of flower should be removed from the show-house, and cuttings taken of all that are required, selecting the firmest and healthiest shoots, dipping these in a mixture of water, soft-soap, and tobacco-juice, to kill aphis, and place them singly into thumb-pots, using a sandy loamy soil. The cuttings should be about 3 inches in length. Place them in a cold frame placed to face the north, and keep the foliage fresh by frequently damping it lightly with the syringe; shade from bright sunshine.

BEGONIAS, treated as advised on p. 595 of the last volume, will now be sufficiently forward to admit of their being potted into 48-sized pots, using a light sandy soil, mixed with a liberal quantity of spent Mushroom-bed manure and peat. Place the plants on the benches near the glass in the intermediate-house.

GENERAL WORK. — The early crops of Peas, Potatos, &c., having now been removed, quarters will be found in which to plant the remaining stock of autumn and winter-flowering plants, first affording the beds a dressing of well-rotted stable manure, and digging it in. Select the first dull day for planting out the various Salvias, Lantanas, Eupatoriums, Solanums, &c., and in doing so plant at such a distance apart as will allow of the plants attaining a suitable size without being crowded. The same remarks will apply to Richardias planted in the open ground, affording all of these various subjects a plentiful supply of moisture at the roots. Assuming that in most gardens the pits and frames are rearranged, so far as their occupants are concerned, or the season, and that the various plants are healthy, it lies with the cultivator to see that this high standard is maintained for the season. There are, however, many obstacles to success in plant culture, but these can be got over or avoided by paying due attention to the requirements of the plants at the proper time. It is not necessary here to mention the various enemies to plant life, suffice it to say that the least harmful insect should be dealt with as rigorously as the worst.

FRUITS UNDER GLASS.

By Bailey Wadds, *Gardener, Birdsall Gardens, York.*

MELONS.—Continue to make up new beds till the middle of the month, taking care to thoroughly clean the structures of all insects before planting them, especially such as are heated with hot water. The hills or beds, if these remain, should be forked over and top-dressed with loam and manure, and made firm before planting them. Late Melons are looked upon as very useful additions to dessert, and good flavour may be obtained in them even in October by careful attention to the watering, very little water being required at that late part of the season. To plants in beds with swelling fruit a thorough watering of tepid manure-water may be applied twice a week during hot weather, care being taken not to let it touch the stems, or canker may appear. When the fruit begins to ripen, water ought to be given in smaller quantity, but there should be enough afforded to keep the plants from flagging till the fruits are all finished off. Melons in pits heated by dung, &c., and those in hotbed frames, if the soil was moist at the time of planting, will carry their fruit throughout without much water or syringing being needed, merely a damping over the foliage with a fine-rose pot on fine days at closing time being sufficient. During very bright summer weather a little shading of thin lime-wash on the glass will benefit them.

APRICOTS under glass protection, now ripening their fruits, will be benefited, if the soil has got dryish, by having a good watering at the roots afforded them. The heavy rains in June were rather inimical to the Apricot trees whose roots were outside, many fruits turning yellow, and falling off, but those trees which were not severely thinned of fruits will furnish a good crop. In view of the injury heavy rains do at the stoning period, the borders for Apricots should be well drained, so that the water is quickly carried off. Young trees should have their shoots carefully laid in, the laterals removed, and a properly-balanced head formed, the centre being kept an open space. The fastenings of the earlier-trained shoots should be examined, and those which have got tight should be cut so as to prevent injury to the rind—often the forerunner of canker. Fruits for dessert should remain on the tree till thoroughly ripe, or the flavour will be deficient. For jam-making, &c., the fruits should be gathered before they are quite ripe. Earwig traps of small flower-pots with a bit of dry moss or hay stuffed into them, should be placed about the Apricot trees, and the insects killed by being turned into a can of boiling water; failure to catch these marauders causes the loss of much of the finest fruit.

ORCHARD-HOUSE.—Vigilance will be required by the various kinds of fruit trees in mixed orchard-houses; the Peach, Nectarine, and, indeed, all stoned fruit trees needing careful watering towards the ripening period, especially such as are in pots and tubs; for although a certain amount of dryness in the soil is necessary at that period, the foliage must not be allowed to flag at any time, or the fruit will be deficient in flavour and juiciness. When the fruit of any variety is all gathered from a tree, a thorough watering and syringing should be afforded the tree; Quassia-water and also clean water being employed to rid it of insects; and all such trees ought to be placed by themselves for suitable treatment, and if they are placed outside, they should be plunged in some light spent hot-bed material, to shield the pots from the sun's rays, paying particular attention to the watering and syringing. Late kinds and varieties of fruits must be syringed daily, and afforded plenty of air by day and a little by night. Spring-potted Apple, Pear, and Plum trees should be induced to make good growths the first season.

THE FLOWER GARDEN.

By John Lambert, *Gardener, Powis Castle, Welshpool.*

SHRUBS.—All shrubs and specimen trees, Hollies, &c., late planted, should have the soil at the roots examined as to the state of moisture or otherwise, well watering it if found to be getting dry, and syringing the heads in the afternoon and evening in hot weather. This will often be the means of saving some which would, failing this attention, succumb. Large or small trees and bushes should have a basin formed round them, corresponding in size to that of the head, which may be done by scooping the soil away from the stem a little, and drawing some from outside, so as to form a ridge of about 4 inches high. This will retain the water, especially on sloping or very hard soils, just where it is needed. If trees and bushes are much exposed to sun and air, a mulch may be applied.

BEGONIAS.—Seedlings, when large enough, may be potted on, pricked out into boxes, or planted in prepared beds of good soil in the open, where they will make capital tubers by the autumn, useful for planting in the flower-beds next year.

ROSE BUDDING.—This operation will require attention in warm dull weather. Before commencing to bud, go over the stocks, and reduce the shoots to three—the strongest and best placed. Having done so, choose well-developed, plump buds of the required varieties, putting the rose shoots in a covered watering-can. Place the buds well down in the angle formed by the shoot with the stem of the stock, and tie securely with soft worsted or bast. If the bark of stocks or Roses does not run readily, water the plants heavily, and wait a few days before commencing the job.

ROSE-BEDS AND BORDERS.—Remove at short intervals faded flowers, pinch off the seed-pods; syringe with an insecticide all bushes, &c., infested with green-fly, and keep a sharp look-out for caterpillars, or the flowers, as well as the foliage, will soon be disfigured. Keep the heads of the standard Rose trees fairly thin by removing thin, blind, misplaced, or crowded shoots, rubbing off all shoots on the stocks, and removing suckers. The flowering of climbing Roses having approached its end, cut out all the weak and worthless shoots, and dress the plants with an anti-mildew preparation and an insecticide, thus preparing some of them for a good supply of bloom at a later date. Maréchal Niel, if gone out of flower, should be cut hard back, when, if the plants are in good health, they will break and make growths of 8 or 9 feet in length, which will produce fine blooms the next season.

HINTS ON WORK IN GENERAL.—Subtropical beds will require much labour in tying, watering, and syringing the plants, especially such of the latter as are plunged in pots. Carpet-beds should be damped over every evening in hot weather, and some of the tender plants not well hardened-off may require shading during bright sunshine. Turf which was laid at a late part of the season and that beneath umbrageous trees, will be improved by occasional heavy waterings. Late-sown Sweet Peas, Tropæolum Ball of Fire, and other similar plants, should have small Pea-sticks placed to them as supports; Verbenas may be pegged down, and Mignonette plants thinned.

THE KITCHEN GARDEN.

By Arthur Coombes, *Gardener, Himley Hall, Dudley.*

SALADINGS.—During the warm weather sowings should be frequent of Mustard, Cress, Radishes, and Lettuces, the last-named as far as possible, where they can remain, to attain full size. North borders and other places in the garden should be chosen for the various sowings, and if the land be dry at the time, it should receive a good watering the evening before sowing the seeds. The same practice should be followed with transplanted stuff, also affording the plants water before and after transplanting. Do not plant Lettuce between tall-growing crops, as the plants become drawn and the leaves twisted in growth. Keep all salad plants of whatever age, moist at the roots, and the land stirred with the Dutch hoe to prevent evaporation of water.

CABBAGES.—The time has arrived when sowings of Cabbage for spring and early summer supply should be made, the exact date depending upon the earliness or otherwise of the district. As a rule, if seeds be sown very early the plants make too much growth before the winter sets in, and are liable to bolt. In my district the suitable period for sowing is from July 15th to the 20th, which in the generality of years is sufficiently early for this part, but too early for more southerly counties. A sowing is also made about the 3rd or 4th of August, and full plantings are from both sowings. Sow on well-exposed ground that has not grown any of the Cabbage tribe for some years—the longer the better. If it be well dug and is sufficiently rich, no manure need be afforded, otherwise, a light dressing of rotten manure is necessary, the land being well pulverised and mingled with the dung in the course of digging it. It should be trodden evenly all over, made level and smooth, and shallow drills at 6 inches apart drawn, in which the seeds should be scattered thinly if the seed be new. Thick seeding when seed is fresh, unless the plants are pricked out at a very early age, is sure to produce spindly plants that seldom do much good. The seed-beds should be treated as advised for salad plants, and the beds shaded till germination has taken place, when the shading stuff should be taken off instantly.

CELERY.—Supply water in large quantities in bright dry weather, and if the soil in the trenches is becoming baked on the top, loosen it with a hand-fork or the Prussian hoe, and draw out any weeds that may be growing on the sides of the trenches, not hoeing them off, as this causes more soil to fall into the trench than is desirable. As fast as the Pea and other crops are cleared off, throw out more trenches for Celery cultivation, planting them forthwith, watering the plants before and after planting.

GREEN CROPS.—If water and labour are sufficient for the purpose, the planting of Cauliflower, Savoys, Brussels Sprouts, and Kales may be pushed forward as fast as the land becomes vacant; but if water and labour are insufficient, defer the above work till rain falls in quantity. If any of the plants in store beds, except Cauliflower, are growing too quickly, and the ground is not ready to receive them, or other causes prevent immediate planting, a check to growth may be given by raising them up a little with a fork or trowel, watering them before and after the lifting.

ONIONS should now be finally hoed, taking care in doing so not to break down the tops; and afford a dressing of nitrate of soda if showers of rain should occur, or after artificial watering. Mulch with spent Mushroom-bed manure, &c, if large bulbs are needed, and afford liquid manure once in ten days.

SHALLOTS.—Remove flower heads, and turn the tops down.

GATHERING VEGETABLES.—As far as may be practicable gather these in the early morning, and store in a cool place.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

SATURDAY, JULY 14—Royal Botanic Society.

SHOWS.

SATURDAY, JULY 14—Rose Show at New Brighton.
TUESDAY, JULY 17—Helensburgh Rose and Horticultural.
WEDNESDAY, JULY 18—Durham, Northumberland, and Newcastle Botanic and Horticultural Society (three days). King's Lynn Horticultural.
THURSDAY, JULY 19—National Rose Society (Northern Section), Halifax. Trentham Rose and Horticultural. Halesworth Rose and Horticultural. Elsenham (Herts) Horticultural.
FRIDAY, JULY 20—Forest Hill and Catford Horticultural Society (two days).
SATURDAY, JULY 21—Rose Show, and National Pink Society's Show at the Manchester Botanical Gardens.

SALES.

TUESDAY, JULY 17—Unreserved sale of the collection of Established Orchids, formed by the late T. R. Watt, Esq., of Chislehurst, at Messrs. Protheroe & Morris' Rooms (two days).
FRIDAY, JULY 20—Orchids from Messrs. F. Sander & Co. and others, at Messrs. Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—63°.4.

The literature of Orchids.

ONE special advantage which the passion for Orchid-growing has secured, has been the creation of a literature richer and more varied than pertains to any other order of plants. Hence it is that, if we except the minute anatomy and chemistry of the subject, the history of Orchids is probably better known than that of any other order of plants. This, of course, has not been the main object of Orchid collectors and Orchid growers, nevertheless, it is the one which will be most permanently beneficial to horticulture and to botany. When Orchids shall have gone out of fashion, and some other group shall have taken their place in popular esteem, a revolution which, judging from the past may occur, though it seems distant enough now, then the lessons which the love for Orchids has taught will still be available for other things. From this point of view it is fortunate that the cult of Orchids is of comparatively recent development, because it has coincided with the rapid progress of science in all departments. Other families have been popular favourites for centuries, people rave about the Rose as much and as justly as ever they did, its beauty and fragrance are still unsurpassed, but neither they nor Carnations and Daffodils, Iris and Lilies, nay, even Vines and Wheat, long as they have been cultivated, have by any means such an up-to-date literature as Orchids.

All the horticultural weekly journals, and there are now nine, where a few years ago there were but three, find it necessary to devote a considerable space to Orchids. Besides which, there is one journal specially assigned to them, the *Orchid Review*. In France there is the *Orchidophile*, in Belgium the *Journal des Orchidées* and the *Lindenia*. Then, if we turn to less ephemeral literature, we have in this country WILLIAMS' *Orchid Growers' Manual*, of which a seventh edition is before us; VEITCH'S encyclopædic *Manual*, recently completed, most trustworthy, and excellent in all particulars except its arrangement; the sumptuously illustrated publication issued by Messrs. SANDER, under the title of the *Reichenbachia*, one of the finest illustrated works ever issued; the useful *Orchid Album*, published by Messrs. WILLIAMS, besides other books of less pretension, and intended principally for the use of amateurs and beginners.

The purely scientific interests have been well looked after by LINDLEY and HOOKER, BATEMAN, and ROLFE, in this country; by REICHENBACH PFITZER, KRÄNZLIN, and others in Germany; by MORREN and COGNIAUX in Belgium. Our own pioneers' share in the work—we need not hesitate to avow it—has been large. In our columns, LINDLEY and REICHENBACH published so much, that, so far as cultivated Orchids go, a very large share indeed of the literature is enshrined in our volumes from 1841 onwards. Moreover, this is matter of permanent value. We may also lay claim to have led the way in cultural matters, and to have shown that Orchid culture was not an affair of mystery, but of the right application of sound general principles; not the exclusive luxury of the wealthy, but a gratification to be enjoyed also by those of modest means. "Orchids for the Million" was the title of a series of articles contributed by the late B. S. WILLIAMS to our columns in 1850, articles which have undergone progressive evolution till now they lie before us in a portly richly-illustrated volume in the shape of the seventh edition of the *Orchid-Growers' Manual*. This is a further extention of the old edition. In it the garden names are maintained even to the use of sectional names, as if they were generic, e.g., Zygopetalum is split up into Zygopetalum proper, Promenæa, Bollea, Pescatorea, &c. The sign of hybridity is often omitted, which is to be regretted; but on the whole, the book is as thorough and good for garden purposes as ever it was, and may be highly recommended to the notice of the British gardener.

Simultaneously with the receipt of our seven-times-tried friend comes a new candidate for public favour, and we can at once say that its success is assured. In M. LUCIEN LINDEN'S *Les Orchidées Exotiques et leur Culture en Europe*,* we have a portly volume of over a thousand pages of large octavo, well printed, well arranged, well indexed, and with numerous illustrations, but with no maps. To review such a work critically and thoroughly would necessitate a large expenditure of time and research. We have seen enough already, however, to justify our favourable opinion. This is no mere paste-and-scissors book, still less is it a commercial sale-list. It is the work of a tried expert, who has known how to avail himself judiciously, and with due acknowledgment, of the writings of others, and to incorporate them with his own. Thus, the name of M. COGNIAUX, which finds a place on the title-page, is ample guarantee that the botanical portions are correct, while the portrait and dedication to JOHN LINDEN will remind the reader of the unrivalled opportunities that the son has had. The dedication is as well turned as it is appropriate. We should spoil it if we translated it, therefore we shall be excused for giving it in the original:—

"À mon Père.

"À l'explorateur botaniste à qui la science des Orchidées doit ses plus grandes, ses plus nombreuses et ses plus fécondes découvertes.

"À mon premier maître et mon premier modèle, à mon meilleur ami.

"Je délie ce livre . . . ."

* Brussels: 100, Rue Belliard. Paris: O. Doin, 8, Place de l'Odéon.

The primary object of the work is to afford the Orchid-loving public information and practical advice in a form more compact and convenient than the pages of a periodical journal like the *Journal des Orchidées*. The special competence of M. LUCIEN LINDEN as a cultivator is acknowledged on all hands, and many will be glad to have in so convenient a form a summary of the general principles of cultivation followed in the remarkable establishment at Brussels, of which the author has been the responsible director for many years.

The introductory chapters are devoted to the botanical history of Orchids and to the conditions under which they grow naturally. In this portion of the work M. LUCIEN LINDEN must have derived great assistance from his father as well as from M. COGNIAUX and M. GRIGNAN. In dealing with the division of the order into tribes, the author has had the happy idea of describing a few Orchids as illustrative of the main subdivisions. Thus, to illustrate the Epidendreæ and the Vandæ we have brief comparative descriptions of Miltonia vexillaria, Zygopetalum crinitum, Lælia anceps, Sophronitis grandiflora, Calanthe vestita, &c.

The classification adopted is that of BENTHAM, as given in the *Genera Plantarum*, itself a slight modification of that proposed by LINDLEY. At p. 83 is given an analytical key, for the purpose of identifying the tribes and genera, and which will be very convenient to those who have acquired sufficient knowledge to be able to use it. Beginners make a mistake in attempting to use such keys, which are more serviceable as hints to the initiated than as guides to the novice.

The history of the introduction of Orchids to European cultivation forms the subject of a separate section, and lists are given of the several collectors, and of the plants introduced by them—lists which probably might be extended with advantage. The natural conditions under which Orchids are found are well illustrated by some notes contributed by BUNGEROTH, CLAES, NÖTZLI, and AUGUSTE LINDEN, which we commend to the attentive notice of the reader.

These details naturally lead up to the consideration of the temperature and degree of moisture to be afforded to the plants in cultivation; but in this matter, as we have often said, strict imitation of Nature in some particulars, even if it were possible, would be ill-judged, because it is impossible to imitate them all. The art of the gardener is not to imitate the unattainable, but to know how to bend to circumstances, and enable the plants under his charge to adapt themselves to the new conditions in which they are placed. Some useful indications are given on the structure and conformation of the vegetative organs, and their relation to the manner in which they should be grown. Then follow clever chapters on "Temperature, and the relative degrees of heat required by each class; and selections of the principal genera and species adapted for cultivation." In these lists, as in all other arbitrary selections of the kind, useful though they may be, there are some few to which many growers, in this country at least, would take exception. For example, "Nanodes in general" are set down for intermediate and warm house; whereas, the only one in general cultivation, Nanodes (Epidendrum) Medusæ is found in Great Britain to grow best in the cold-house. Also the little highland Indian Cœlogyne odoratissima is set down for "warm-house," while here we find it safe only in a cool-house.

In the chapters dealing with the general treatment of Orchids, such as re-potting; the material to be used in the operation, watering,

FIG 7.—ANGRÆCUM FOURNIERIANUM: FLOWERS WHITE.

(A newly-introduced Orchid, described at p. 808, vol. xv., 3rd series, by Professor Kränzlin.)

shading, &c.; the author deals with each of the subjects in a thorough manner, in every detail displaying his intimate knowledge, gained by many years of careful study and observation, and his assimilation of every reliable fact gleaned from the correspondence of collectors and other available sources.

Of the greatest interest are the articles touching on the construction of Orchid houses, accompanied by illustrations showing every detail of the structures in use in Belgium, and the manner in which they are heated and shaded. The Belgian houses, as we have had repeated opportunities of knowing, seem to be designed as simply as possible consistent with embodying every feature considered salutary for the plants, and we have no doubt that some of the details, at least, might be introduced into Orchid-houses in England with beneficial results.

The work contains a calendar of operations for the whole year, and the fourth part, extending from p. 563 to p. 1119, contains "Descriptions of the principal Orchids cultivated in Europe," together with a very complete index. In alphabetical order the genera are dealt with, and their botanical features and cultural requirements set forth. Under each genus the best species are described, special information for culture, and as to time of flowering, being also given.

In the matter of nomenclature, the work is up to date, all the genera and species being placed in accordance with the views of the best botanical authorities of our times, though we regret to find the names of the authorities for the species omitted, an omission which is serious in a book of reference. Over some of the vexed questions the author has occasionally, like the rest of us, to emit a slight groan. Under Cattleya (p. 621), he says, "Mais, il existe encore une autre grave difficulté. Doit-on considérer comme des espèces distinctes, ou seulement comme des variétés du C. labiata, ces formes splendides, si populaires et si répandues et dont le nombre s'accroît tous les ans d'une moisson nouvelle, les C. Trianæ., Mendeli, Mossiæ, gigas, Gaskelliana, Eldorado, Percivaliana, &c.?" So far as some of them are concerned, we should say, certainly not! In the enumeration the author drops the name "labiata," and uses the popular as if it were the specific name, —a course which will not be objected to by the botanist if he is duly forewarned, and which will recommend itself to the amateur and gardener. Wonderfully few misprints are to be noted, considering the magnitude and complexity of the work. Cattleya Trianæ should be Trianæi; Linnée should be Linné, at least it is so spelt in French botanical books; cirrhosum should be cirrosum.

We have said sufficient to show how comprehensive the book is. Little or nothing relating to Orchids seems to have been forgotten, though naturally some sections are better and more thoroughly treated than others; the chapters on insects and fungi attacking Orchids are, for instance, rather meagre.

The work is sure to fulfil the main object of its projector, to diffuse the knowledge of Orchids and their cultivation in Europe; whilst as a book of reference for the expert it will be invaluable.

Spot on Grapes.—This week and the last we have received such very numerous specimens of this disease from all parts of the country, that we fear it is very widely prevalent. It is especially prevalent on Muscats. A brown spot appears at the stalk end of the berry; this extends, till ultimately the whole of the berry becomes a rotten mass. Sometimes, but rarely, there may be seen small raised black dots; these are the fructification of the fungus. The disease was first noted in our columns by Mr. Berkeley in 1871, and again so recently as December 6, 1890, by Mr. W. G. Smith. We should recommend that all affected bunches be immediately destroyed by fire. Spraying in the present advanced stage would be quite useless, though it might have been used as a preventive at an earlier period.

Floral Decorations at Buckingham Palace.—On the occasion of the state concert at Buckingham Palace on Monday evening, the decorations of the state rooms were carried out by Messrs. Wills & Seegar, 16, Onslow Crescent, S.W. The exigencies of space required that a series of pretty floral pictures should be arranged in alcoves, corners, fireplaces, &c. In the tea-room a noble group of plants was set up—Palms, Dracænas, Ferns, &c., with which were mingled white Lilies, Hydrangea paniculata, &c. This was most effectively repeated on a smaller scale in other parts of the various rooms. In the picture gallery are four white marble fire-places, and in each of these Mr. Wills employed sprays of Mr. Turner's new Rose, Crimson Rambler, with brilliant foliage, Ferns, white Lilies, and Spiræa astilboides. The Rambler was seen to the best advantage under the brilliant light. The combination was perfect, and it was one of the happy inspirations which so exalts the art of the decorator.

Chelmsford Recreation Ground.—A new recreation-ground was opened at Chelmsford on the 4th inst., consisting of a total area of 27 acres. The initial expense has been about £2000, and the whole of this has been provided by private persons, entirely independent of the rates. A full report and description is given in the *Essex Chronicle* for Friday, July 6.

Flower Shows. — We have reports from Bearsted, Ightham, and Sittingbourne (Rose), on June 30; Malling and Leeds, July 2; Larkfield and Sevenoaks, July 3; Maidstone, July 4.

Golden Douglas Fir. — Mr. Dunn kindly sends us a branchlet of the Douglas Fir, in which the young growth of the year is of a beautiful clear primrose-yellow, so that the tree must indeed be a beautiful object. The specimen was communicated in the first instance by Mr. Fender, gardener to J. Maxtone Graham, Esq., of Cultoquhey, near Crieff. The tree was only planted two years ago, and previous to this year has not differed from its fellows. It remains to be seen whether the coloration will prove permanent, and if so, what effect it will have on the rate of growth of the tree.

A Viola Conference.—A Birmingham correspondent writes:—"The great interest now taken in the Viola, and the influx of so large a number of new varieties annually, has created a desire on the part of many leading raisers and cultivators of this flower to hold a conference of specialists, and this has been arranged for Friday, August 3, being the day fixed, to enable those who attend it also to see the Great Midland Counties Carnation and Picotee Show on the Saturday, August 4, the Birmingham Botanical Gardens having been kindly placed at the disposal of the promoters of the conference, and blooms of seedlings and new varieties of Violas as well as Pansies are invited, and certificates will be awarded to first-class kinds, papers read, and discussion promoted. Any information will be supplied by the hon. sec., W. Dean, Dolphin Road, Sparkhill, Birmingham.

The Birmingham Botanical Gardens.—The large exhibition hall here, which is also used as a conservatory and promenade, has been recently lengthened at a cost of nearly £800, and a permanent orchestra constructed for the purpose of concerts, &c., and for the flower shows which are held in the building. Other improvements are contemplated, such as the formation of a rock and bog garden; a rearrangement of the herbaceous borders, botanical lectures, &c, and to make the gardens more a school for botany than it has been. The formal opening of the addition to the exhibition hall was inaugurated by the Mayor of Birmingham on the 4th inst., when there was a large attendance of subscribers and visitors, and the band of the Royal Marines from Portsmouth was in attendance.

Isle of Wight Horticultural Improvement Association. — The monthly meeting was held at Warburton's Hotel, Newport, on Saturday, July 7, when an excellent address on the "Cultivation of Cinerarias, Primulas, and Calceolaria," was given by Mr. J. Barkham, F.R.H.S., Longford House Gardens, Haven Street, I.W. Mr. Barkham, who has grown the above subjects from 2 to 4 feet in diameter, is considered to be unapproachable by any gardeners in the Island, so far as cultivation of these plants is concerned. The discussion afterwards was taken up by Dr. Groves (chairman) and several of the members. The table was decorated with a fine collection of Roses by Mrs. Williams, Gatcombe. The plant exhibits were especially fine, and such as are not witnessed very often in the Island. Mr. T. Barker, gardener to J. Wood, Esq., Ryde, showed a a plant of Oncidium macranthum, having a flower raceme 12 feet long with 11 blooms, Sobralium guttatum, very fine; and Cattleya gigas Sanderiana, with 7 very fine and largely-developed blooms. This new association bids well for success in its objects of horticultural education.

Testimonial to Mr. William Dean.—At the request of the Midland section of the committee interested in getting up this testimonial, the presentation fixed for July 9, his 70th birthday, has been postponed till August. The Hon. Treasurer, however sent on that day to Mr. Dean a substantial instalment of the amount collected. Any further subscriptions, however small, will be gladly received and acknowledged by Mr. George McLeod, Hon. Treasurer, 46, Cannon Street, London, E.C., or Mr. William Cuthbertson, Hon. Secretary, Springfield, Rothesay.

United Horticultural Benefit and Provident Society.—The quarterly meeting was held at the Caledonian Hotel, Adelphi, on Monday evening, 9th inst., Mr. G. W. Cummins presiding. Forty-five new members have been elected this year; three deaths have occurred, and two members are on the sick fund at the present time. The treasurer reported that he had purchased £200 South Indian Railway, 3½ per cent. stock, guaranteed by the Indian Government. The usual business of the society was transacted, and a cordial vote of thanks to the chairman ended the meeting.

Beddington, Carshalton, and Wallington Horticultural Society.—In connection with the annual show of this Society in Carshalton Park on the August Bank Holiday, a Conference on Gardening will be held at 5 o'clock in the afternoon, under the presidency of the Right Hon. Jesse Collings, M.P., supported by E. J. Halsey, Esq., J.P., Chairman of the Surrey County Council, and of the Technical Education Committee, and H. Macan, Esq., M.A., F.C.S., Organising Secretary. Superior and inferior garden produce will be exhibited, and a short address thereon delivered by Mr. J. Wright, F.R.H.S., County Instructor on Horticulture. Questions on any point in connection with gardening may be asked by any persons at the meeting, or may be previously submitted to the Secretary in writing, with or without names of the querists. Specimens for demonstration, examples of plants, fruits, and vegetables, good, bad, or indifferent, will be welcomed by the committee for the purposes of instruction. A. H. Smee, Chairman of the Committee; G. W. Cummins, Hon. Secretary.

New Publications. — *Agricultural Zoology.* By Dr. J. Ritzema Bos. Translated by J. R. Ainsworth Davis. (Chapman & Hall.) — *Mountain, Moor, and Lock.* (Sir Joseph Causton & Sons.) — *Considérations Générales sur les Anomalies des Orchidées.* Par le Professor Penzig.—*Kew Bulletin*, July.—*A Handbook to the Study of Natural History, for the Use of Beginners.* Edited by Lady Isabel Margesson. (G. Philip & Son.)

OPUNTIA AND ITS RELATIVES.

Now that an attempt is being made to bring Cacti and succulent plants generally to the fore, it may be of interest to lay before our readers the accompanying sketch (fig. 8). It shows how the ordinary flat branches of an Opuntia may assume the slender cylindric form of the branches of such plants as Cereus flagelliformis. Whether the flat form was derived from the cylindrical, or *vice versâ*, we cannot say. We can only guess that in obedience to new requirements, the cylindrical assumed the flat form, and if so the case above-mentioned is an instance of reversion.

HOME CORRESPONDENCE.

THINNING PLANTATIONS.—In Mr. Webster's article on this subject, in the *Gardeners' Chronicle* of June 23, he tells us several facts which we should imagine were pretty generally known by this time. In explaining why trees are able to exist and put on timber with small crowns only, however, he makes the novel statement that "the leaves of the trees are produced much closer (?), and in consequence have a greater amount of surface exposed to light and sunshine, when the trees are grown thickly together, than when allowed plenty of room." Up till now, we have been labouring under the impression that woods were thinned for the express purpose of allowing light to enter to a lower level, and thus increase the leaf-surface exposed to it. If Mr. Webster's statement be true, then we, and doubtless many others, have based our thinning operations upon a gross error, and a great loss of time and timber must have resulted from it. Mr. Webster also states that the root-spread of trees with small crowns is narrow. Why this is so he does not explain; but we should have thought that the narrower the root-spread so much the less plant-food from the soil would be at the tree's disposal, and that this circumstance, therefore, would not be likely to favour the increase of the stem with a small crown, which is Mr. Webster's argument. It is also rather difficult to trace the connection between the thickness of the bark, the health of the tree, and production of a useful stem." We generally find that the thickness of the bast (from which the bark is formed) and the activity of the cork cambium is in direct proportion to the growth of the wood ring, and that a vigorous-growing tree has a corresponding thick bark, and *vice versâ*. We may possibly be mistaken, however, on these points. *A. C. Forbes.*

A FEW STOVE AND GREENHOUSE CREEPERS.—Amongst stove creepers which are not rampant growers, and can easily be kept within bounds, the beautiful Stigmaphyllum ciliatum, of graceful growth, nice foliage, and charming Oncidium-like flowers, should find a place; so also should the beautiful Solanum Wendlandii, with its clusters of large-sized, pale mauve-coloured flowers, and which blooms so freely. These two plants are growing side by side in the Birmingham Botanical Gardens, and contrast pleasingly in colour. Some of the Aristolochias also well deserve more general cultivation; and in a moist stove in Yorkshire, I recently met with examples of Gloriosa superba, in fine condition. Amongst greenhouse creepers, the handsome Mandevilla suaveolens is rarely seen now, with its profusion of white blossoms. Some few years ago I saw it in full bloom in the large old-fashioned conservatory at Strathfieldsaye; it does best planted out, and so well deserves more attention. [Perhaps it is too "dirty" a plant for present-day gardeners. Ed.] Bignonia jasminoides is another free-growing evergreen creeper, with white flowers, admirably suited to larger houses, and does best planted out; and another old favourite plant, Mitraria coccinea, although not absolutely a creeper, can be used as a wall plant, and just now a plant several feet high trained against a wall in the large floral hall of the Birmingham Botanical Gardens, and planted out, is "a thing of beauty," with its rich orange-scarlet flowers. The scarlet Trumpet Evergreen Honeysuckle, although a hardy plant in the more favoured parts of the country, is a very beautiful plant as a creeper in a cool greenhouse which suits it. In a north house near me, devoted to Palms, Azaleas, &c., a plant is in luxuriant growth, and is planted out in the open border, and trained up a support, and it covers a large space under the glass, and it has been in flower for a long time, its bright orange-scarlet Honeysuckle flowers being much valued for indoor decorative work, and a basket, bouquet, or vases of these flowers with white Marguerites or other graceful suitable flowers is a very charming combination. *W. D.*

RAVENSCOURT PARK, HAMMERSMITH.—This, one of the prettiest of the smaller suburban parks under the control of the London County Council, is just now looking extremely well. A new feature—the rockery—is at present attractive, and will, when established, be a source of increased interest and pleasure. A rough piece of ground facing the high road has been taken in, and tastefully laid out and planted this season, effecting a great improvement. The bedding (as is proper) is not overdone, the delightful breadths of green sward not being cut up, but serve as pleasant "eye-resters." Beds of Fuchsias are doing well, showing the adaptability of the plant for this purpose. A little carpet-bedding—nicely designed—will find admirers of this style of garden embellishment. It struck the writer, in going through the Park lately, that the Hammersmith Horticultural Society might well utilise such charming

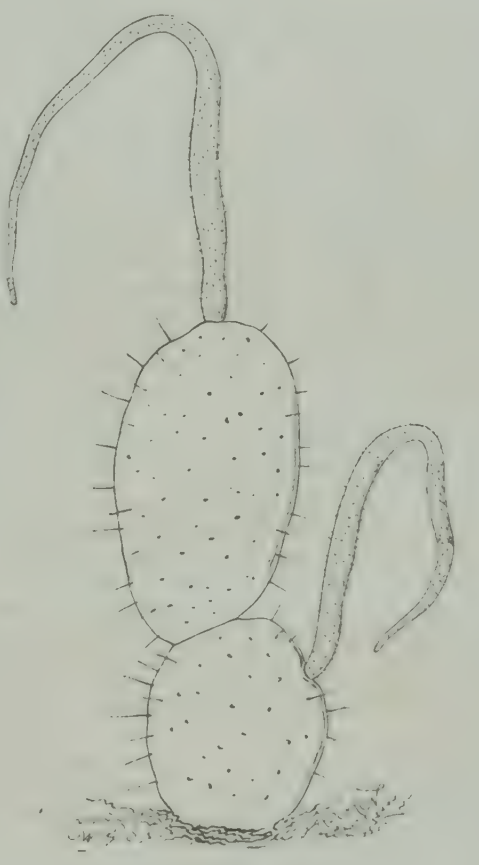

Fig. 8.—TWO-FORMED OPUNTIA.

(Specimen grown by Mr. W. G. Smith.)

surroundings as the Park affords for its annual flower show. A precedent has been set for this in the neighbouring parish of Acton, where the annual flower show has been held with much success in the Acton Recreation Grounds. The important borough of Hammersmith certainly deserves a better place for its annual flower show than a cramped schoolroom, where its recent exhibition was held. Will the committee of the Society be enterprising enough to hire a tent, and have their next display in Ravenscourt Park? New life would thus be infused into the Society, visitors in plenty be attracted, and any additional expense incurred recouped by this little bold, but much wanted action on the part of the Society. *J. B.*

PHORMIUM TENAX.—It is rather singular that this plant should succumb to the winter in Cornwall (see *Gardeners' Chronicle*, vol. xv., p. 814), and survive here. We have a strong plant now coming into flower, which has lived without protection for several years, which has flowered at various times before. It is growing in a well-drained and sheltered position. It may be that the failure of the plant in Cornwall is due to imperfect drainage. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

EREMURUS ROBUSTUS.—This plant has thrown two grand spikes of flowers here this season after failing to flower for several years. The beauty of this species must be seen to be fully realised, the greenish-yellow ovaries in the centre of the pale pink flowers—of which there are over 300 on each spike—gives it such a distinct and pleasing character. It does not seem to seed naturally, but I have tried what can be accomplished by artificial fertilisation. Can any reader of the *Gardeners' Chronicle* inform me if the plant has formed seed in this country? or is some special insect required for this purpose? Its foliage was much damaged by the frost on May 21 and 22, although it is in a very warm and sheltered position. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

THE POTATO DISEASE.—I little anticipated when I penned the short note on this subject, inserted last week, that I should so soon have observed the dread pest. Judging cottage gardens at Reigate on the 6th, I found in one low-lying garden a patch of early Potatos, the leaves of which were virulently spotted with the fungus. It was unfortunate that no one in this isolated place was at home to advise the pulling and destruction of the haulm immediately. A few hours later the district was visited by a very heavy thunder-storm, and I can now very well imagine, after the exceeding humidity of the succeeding night, that the tops of the patch must in a few hours have become quite black. This garden not only lies low, but close in front is a brook, down which flows in a considerable stream the effluent from the local sewage-farm—black, foul, and offensive. No wonder if, in such a position, the atmosphere is full of fungoid germs. Had the spot not been so strikingly in evidence prior to the storm, then the electricity with which the air was so highly charged would have had to bear the blame, no doubt. I could but think that with our present knowledge of the nature of the Potato disease, and of the powerful antidote to it that the Bordeaux Mixture presents, it would be well if local sanitary authorities could furnish their inspectors with an Eclair sprayer, and the needful ingredients for the mixture, then these officials could be empowered, so soon as the disease presented itself in their districts, to give the Potato breadths affected a sulphate of copper dressing, that very much might be done to arrest the operations of the fungus, and save the crops. That course would lead many having large breadths to do their own spraying. *A. D.*

CLEMATIS, COUNTESS OF ONSLOW.—It may be interesting to know that a similar plant to that figured at p. 9, was raised here about five years ago. My plant, which now has become the property of M. Louis Späth, is also exceedingly free-flowering, especially towards the points of the growths; the flowers are deep rose-purple. *Max Leichtlin, Baden-Baden.*

JAPANESE BAMBOO NAMES.—Mr. Freeman Mitford stated in the *Gardeners' Chronicle*, vol. xv., No. 379, p. 407, that the Japanese word "sasa" is a corruption of the Chinese words Hsiao Tsao. But this is incorrect. The word sasa is purely Japanese. It means small or trifling. Sasa as a name of plant is either onomatopœtic (the sound of leaves moved by the wind), or a contraction of sasa-dake, meaning a small Bamboo. The word Kumazasa is a compound of the two words Kuma, margined, and zasa, small Bamboo. It is the Japanese name of Arundinaria Veitchi, in Mr. Bean's classification of hardy Bamboos in the *Gardeners' Chronicle*, vol. xv., No. 376, p. 301. The Japanese name of Phyllostachys Kumazasa in his classification, is Okamezasa. Bangozasa in the same journal, p. 407, seems to be a misprint of Bungozasa. *S. Okubo, Tōkyō, Japan* [With reference to this communication, we have received the following note from Mr. Mitford:—"In Hepburn's *Dictionary of the Japanese Language*, the word *Sasa*, the generic name for the dwarf Bamboo, is written with the two Chinese characters, *Hsiao Tsao*, "small grass." *Sasa*, "small trifling," would be written with the character *Hsiao*, "small," repeated. Hepburn was assisted in the compilation of his *Dictionary* by the highest native authorities available. *Hsiao Tsao* at once points to a dwarf plant of the grass family; whereas *Sasa*, written as Mr. Okubo suggests, gives no such indication." Ed.]

FOOD REQUIREMENTS OF THE CHRYSANTHEMUM.—Your correspondent, Mr. W. Dyke, of Turnford, at p. 18, vol. xvi., asks certain questions regarding the food requirements of Chrysanthemums. In the first place, the actual amount of ash in the Chrysanthemum plant was not given me by Dr. Griffith, but the omission does not affect the manurial formulas quoted, because unless the total weight of the Chrysanthemum plants grown were known, the amount

of ash constituents abstracted from the soil could not be ascertained. Further, it is always necessary to apply an amount of food-constituents considerably in excess of the actual requirements of a crop, as only about 60 per cent. at the most of the food supply becomes immediately available, and is taken up by the growing plant. For instance, in one of Sir J. B. Lawes' experiments at Rothamsted on grass-land, the total constituents of 1 ton of hay are applied annually, and yet the yield of hay in the average of twenty years is only 11⅝ cwt. per acre in excess of that grown without manure. In the first formula quoted, Mr. Dyke will see that it is nitrate of potash which is recommended; now this is a very concentrated manure, and contains 44 per cent. of potash, and 13 per cent. of nitrogen, equal to 67 per cent. sulphate of potash and 16 per cent. of ammonia. The phosphate of soda will furnish soluble phosphoric acid and soda in the most quickly available form, while the superphosphate provides the phosphate and lime in a slower acting condition. It may also be mentioned that most of the good loams employed in the culture of the Chrysanthemum contains from a quarter to one-half of 1 per cent. of potash in their composition, which, of course, renders the direct application of artificial potash less necessary. In the second formula, kainit and nitrate of soda are quoted instead of nitrate potash and magnesia. Kainit will furnish about 25 per cent. potash, 14 per cent. magnesia, and 30 per cent. sodium; while the nitrate of soda will provide the nitrogen required. The constituents in kainit are not in such a readily available condition as in nitrate of potash. With regard to sulphate of iron, it is true, as stated by Mr. Dyke, that most soils contain iron; but it is in a condition not easily assimilable by plants, and therefore assists very little in the formation of chlorophyll. I have seen very good results follow the direct application of sulphate of iron, and if Mr. Dyke will give it a trial, I think he will find it beneficial not only to Chrysanthemums, but to many other plants also, especially in the action of assisting plants to keep off disease. *J. J. Willis, Harpenden.*

ARUM DRACUNCULUS.—I see, in *Gardeners' Chronicle*, p. 16, mention is made of this species of Arum flowering profusely this year. In Hampshire it is doing likewise, in our herbaceous border. This Arum, in strong and retentive soil of our garden, is perfectly hardy. The huge rich purple spathes are an interesting sight, but very evanescent, especially if the weather be warm and dry. *E. M.*

SOCIETIES.

NATIONAL ROSE, CRYSTAL PALACE.

July 7.—The annual exhibition of the National Rose Society, held at the Crystal Palace on Saturday last, was attended with the success it usually enjoys. On this occasion the arrangements differed a little from what has formerly prevailed, and they were an improvement—although making it less easy to gauge the quantity of flowers as compared with the exhibition of last year. It is, however, we think safe to say that there were more flowers than on the last occasion. It is gratifying to notice that year by year, the number of amateurs taking part in these exhibitions of the popular flower is increasing, and their exhibits when compared with those shown by the trade, constitute a much more important and interesting feature than formerly. The quality of the blooms staged on Saturday was good and of much better general average than those at last year's show, and it may be necessary to add here that although this was the case, there were but few extra fine blooms, none such as the surprising flower of Cleopatra, exhibited by the Rev. F. R. Burnside at the show at Windsor. Some of the Roses had disfigured petals, but in this respect also they compared favourably with those of last year. The extremely hot weather that has lately obtained, was succeeded on Saturday by much less heat, and the flowers remained fresh correspondingly longer, besides which, it was a welcome change to the Rose-loving public, who came to admire or criticise.

Nurserymen.

The leading class for seventy-two distinct single trusses was won by Mr. Frank Cant, Braiswick Nursery, Colchester, and Mr. B. R. Cant was 2nd, thus reversing the positions these exhibitors held in the leading class at the Windsor show. Mr. Frank Cant's exhibit was composed of even blooms of good quality, though we think they were slightly under the collection that secured this coveted prize last year for the firm of Messrs. Harkness & Son. The varieties were as follows:—*Back row:* Ulrich Brunner, Madame Eugénie Verdier, Gustave Piganeau, La France, Dr. Andry, Caroline Testout, Mrs. Jowitt (good), Her Majesty, Madame Charles Crapelet, Marie Baumann (very large and full), Merveille de Lyon, Earl of Dufferin, Mrs. Jno. Laing, Chas. Darwin, Pride of Waltham, General Jacqueminot (fine flowers), François Levet, Marie Verdier, Duke of Albany, Suzanne-Marie Rodocanachi, Margaret Dickson, Reynolds Hole (a good specimen of this old variety), Marchioness of Londonderry, and Alfred Colomb, the last-named a splendid bloom, of large size and good finish. *Middle row:* Madame Montet, Comte de Raimbaud, Countess of Oxford, Duke of Teck (very good), La Boule d'Or, Charles Lamb, Harrison Weir, Catherine Mermet, Comtesse de Comando, Madame de Watteville, Madame Henri Pereire (very full bloom), Mons. Noman, Victor Hugo, Baroness Rothschild, Horace Vernet (good), Star of Waltham, Countess of Rosebery, Le Havre (large and good), Madame Gabrielle Luizet, Duke of Connaught, Jennie Dickson, Exposition de Brie, and Marquise de Castellane. *Front row:* Duchesse de Morny (a good-sized and pretty bloom), Marchioness of Dufferin, Camille Bernardin, Souvenir d'Elise Vardon, Lady Arthur Hill, Souvenir de S. A. Prince, Alfred Dumesnil, Louis van Houtte, Niphetos, Comtesse de Ludre, The Bride (very fine), Duke of Edinburgh, Heinrich Schultheiss, Prince C. de Rohan (large, and good colour), Jean Ducher, Duke of Wellington, Madame Cusin, A. K. Williams, Beauty of Waltham, Comtesse de Nadaillac, Mary Bennett, Dr. Sewell, Lady Mary Fitzwilliam, and E. Y. Teas. Mr. B. R. Cant was a capital 2nd, and, we should think, only narrowly escaped being 1st. Some of the blossoms, indeed, were finer than any in the 1st exhibit, but the general quality was no doubt a little under. Ulrich Brunner was a very large and good flower; the bloom of Her Majesty was also large; John Stuart Mill was a large bloom, and full; Madame Cusin was large, and Marie Baumann was of an immense size and of good form. The stand contained a wonderful bloom of Maréchal Niel, both in size and colour; and Earl of Dufferin, Alfred Colomb, and Prince Arthur were of extra merit. The 3rd prize was secured by Messrs. Paul & Son, Cheshunt. The blooms in this exhibit were rather small generally, but they were fresh-looking, and many of them were pretty flowers of considerable merit. Madame de Watteville, Catherine Mermet, T. B. Haywood, and Ulrich Brunner might be instanced.

The second class for nurserymen was for forty distinct Roses, three trusses of each, and there was considerable competition. The 1st prize was given to a collection shown by Mr. Frank Cant, Braiswick Nursery, Colchester, who showed a very superb lot; conspicuous amongst these were blooms of Horace Vernet, Comtesse de Nadaillac, Beauty of Waltham, Ulrich Brunner, A. K. Williams, Madame Henri Pereire, Alfred Colomb, Star of Waltham, Earl of Dufferin, and Marie Baumann. Mr. B. R. Cant, of Colchester, was 2nd, with much smaller, less expanded flowers, but some of them were nice and fresh, though others showed signs of damage to the outer petals; the blooms of Duchesse de Morny, Alfred Colomb, and Marie Baumann were very good. Messrs. Paul & Son, The Old Nurseries, Cheshunt, were 3rd.

The best forty-eight distinct single trusses came from Messrs. D. Prior & Son, Colchester, and the blooms shown were of good size, but many of them were rather rough, and a few had slight damage to petals. There was lively competition in this class, and the 2nd place was awarded to Messrs. J. Burrell & Co., Howe House Nurseries, Cambridge; and good blooms of Marie Baumann, Duke of Albany, Heinrich Schultheiss, Suzanne-Marie Rodocanachi, John S. Mill, and The Bride, were the most notable in the Cambridge exhibit; the English Fruit and Rose Co., King's Acre, near Hereford, were 3rd, and staged an exhibit to which we should have been inclined to have given the 2nd position.

In the class for twenty-four distinct single trusses, the most successful competitor was Mr. Jno. Mattock, and the general quality of the blooms was not quite equal to that in the 1st prize exhibits of the larger classes, but still such specimens of Gustave Piganeau, Suzanne-M. Rodocanachi, Earl of Dufferin, and Star of Waltham, as were shown, go far toward making the stand a good one; Messrs. J. Townsend & Sons, Lower Broad Heath, Worcester, made a good 2nd; Marie Van Houtte was a pretty though small bloom; and Dupuy Jamain, Mrs. Jno. Laing, Ulrich Brunner, Heinrich Schultheiss, and Duke of Teck, deserved notice.

Class 5 was for twenty-four distinct Roses, three trusses of each, and Messrs. D. Prior & Son, Colchester, who were awarded 1st place among half a dozen or more exhibitors, staged a very creditable lot of blooms. When many of the blooms in the exhibition showed damage in petal, the collection now under notice may be said to have been very free. Horace Vernet, Alfred Colomb, Gustave Piganeau, Prince Arthur, Earl of Pembroke, La Rosière, and A. K. Williams, were among the best.

Tea and Noisette Section.

The leading class in the nurserymen's division for Teas or Noisettes, was that for twenty-four distinct, single trusses, and in this class there were but few competitors. The premier prize was well won by Mr. S. Prince, Oxford, with a generally good lot, and the best Tea or Noisette exhibited by a nurseryman in the whole show, was included in the exhibit. The varieties were, *Back row:* Comtesse de Nadaillac, Souvenir de S. A. Prince, Madame Cusin, The Bride (Silver Medal); Princess Beatrice, Madame Elie Lambard, Madame de Watteville, and Maréchal Niel. *Middle row:* Alba Roses, Souvenir d'Elise Vardon, Etoile de Lyon, La Princesse Vera, Golden Gate, Miss Ethel Brownlow, Rubens, Princess of Wales. *Front row:* La Boule d'Or, Souvenir d'un Ami, Madame A. Jacquier, Madame Hoste, Niphetos, Marie Van Houtte, Ernest Metz, and Hon. Edith Gifford.

Messrs. D Prior & Son, also had a good lot, and were 2nd, Madame Cusin, Devoniensis, Maréchal Niel, Ethel Brownlow, Madame de Watteville, Niphetos, and Perle des Jardins, were the best. The 3rd prize collection was one shown by Mr. Frank Cant, and the blooms generally were of considerable merit, May Rivers was nice, Souvenir de S. A. Prince and The Bride were fair, Ethel Brownlow was large, but rather rough.

The best eighteen distinct, single trusses, were staged by Mr. J. Mattock, New Headington, Oxford, his exhibit included good specimens of Comtesse de Nadaillac, Souvenir d'Elise Vardon, Madame Cusin, Souvenir de S. A. Prince, Anna Olivier, Madame de Watteville, and Ethel Brownlow. Messrs. J. Burrell & Co., were 2nd, The Bride, Jean Ducher, Comtesse de Nadaillac, Innocente Pirola, and Souvenir d'Elise Vardon being the best.

For 18 distinct Teas or Noisettes, three trusses of each to be shown, the best place was taken by Mr. George Prince, Oxford, who has shown this charming section of the "Queen of flowers," exceedingly well during the present season. His exhibit in this class was one well deserving commendation, though of course of inferior quality to those in the classes for single trusses, Comtesse de Nadaillac, Souvenir d'Elise Vardon, Souvenir de S. A. Prince, Madame Cusin, Madame de Watteville, Catherine Mermet, and Hon. Edith Gifford, was among the best. Messrs. D. Prior & Son were 2nd, the best of this exhibit being the specimens of Ethel Brownlow, Madame Hoste, Catherine Mermet, Rubens, Maréchal Niel, Niphetos, and Souvenir de S. A. Prince.

Open Classes.

For twelve distinct single trusses of hybrid Teas, Mr. Frank Cant was placed 2nd, and staged La France de '89, La France, Viscountess Folkestone, Danmark, Augustine Guinoisseau, Lady Mary Fitzwilliam, Auguste Halem, Germaine Caillot, Kaiserin Augusta Victoria, Princess May, Gloire de Lyonnais, and Maid of the Mist. The first prize in this class was withheld, and there were no other exhibitors.

The best twelve single trusses of any yellow Rose except Maréchal Niel were from Mr. J. Mattock, and he had very fine blooms of Jean Ducher. Mr. Geo. Prince followed, with pretty blooms of Marie Van Houtte; and Messrs. D. Prior & Sons were 3rd, with the same variety.

The best twelve trusses of any white Rose proved to be a collection of Souvenir de S. A. Prince, shown by Mr. Geo. Prince; the flowers were large, and pretty. Messrs. A. Dickson & Sons, Royal Nurseries, Newtownards, co. Down, were 2nd, and had superb Margaret Dickson; whilst Mr. Frank Cant was 3rd, with a dozen blooms of Souvenir de S. A. Prince.

Mr. B. R. Cant had the best twelve single trusses of any crimson Rose, showing large and very full well-coloured blooms of Marie Baumann; the 2nd prize was taken by Messrs. Perkins & Son, Coventry, with A. K. Williams; and the 3rd by S. P. Budd, Esq., of Bath (gr., Mr. J. Bradbury), showing Alfred Colomb in very good form.

The best of any dark velvety-crimson Rose came from Messrs. G. & W. H. Burch, Peterborough, with exceedingly well-coloured Earl of Dufferin; Mr. Frank Cant was 2nd with Reynolds Hole; and Mr. B. R. Cant 3rd, with a stand of Fisher Holmes.

There was much competition in these classes for Roses of one variety, and many of them were to be seen in splendid condition. Mr. Frank Cant had the best of any light Rose (excepting white) in Mrs. Jno. Laing; Messrs. A. Dickson & Sons 2nd, with La France; and S. P. Budd, Esq., 3rd, with Her Majesty. There were seventeen exhibits.

Messrs. Townsend & Sons, Broad Heath, Worcester, were 1st for twelve single trusses of any H. P. or H. T, and they showed Mrs. Jno. Laing in good form; Mr. B. R. Cant, who was 2nd, had Alfred Colomb; and Messrs. Prior & Sons, with Horace Vernet, were 3rd.

Mr. J. Mattock was 1st for twelve trusses of any Tea or Noisette, showing lovely specimens of Souvenir d'Elise Vardon; Messrs. Townsend & Sons were 2nd; and Mr. Frank Cant was 3rd, with Ethel Brownlow.

The best specimens of Maréchal Niel came from Messrs. D. Prior & Son, with moderately sized blooms of good colour; A. Hill Gray, Esq, Biaulieu, Newbridge, Bath, was 2nd; and Mr. Geo. Mount 3rd.

An interesting class always is that for the best twelve trusses of any new Rose, and on this occasion the coveted prize was secured by Messrs. A. Dickson & Sons, Newtownards, for Marchioness of Downshire, a large wide-petalled H.P. variety of deepest flesh colour or rose; Mr. Frank Cant was 2nd, with the Marchioness of Londonderry, a larger bloom than the last-named, and almost white. It is a heavy H.P., and has a little scent. Mr. J. Mattock was 3rd, with Margaret Dickson, a very fine variety of blush-rose or nearly white.

The best twelve new Roses, distinct, single trusses, were from Mr. F. Cant, Colchester, showing good blooms of Violet Queen (a more violet-coloured Chas. Lefebvre) Media, and Marchioness of Londonderry; Messrs. Paul & Sons, Cheshunt, were 2nd; and Messrs. G. Cooling & Sons, Bath, 3rd. There was nothing very striking in this class, the last flower, Violet Queen, being too much like Charles Lefebvre as shown.

The Gold Medal for a new Rose, seedling or sport, was given to Messrs. A. Dickson & Sons' Marchioness of Downshire; Mrs. Edward Mawley, from the same firm, is an improved Margaret Dickson as shown here, but this has yet to be proved. Helen Kellen was again shown, but it is not decided enough in colour. Mr. Prince's Clara Watson was also shown again, as was Messrs. W. Paul & Son's Clio, and Messrs. G. Cooling & Son's Lawrence Allen. All three of the latter were in better form at early shows.

Garden Roses.

Nurserymen.—The classes for garden Roses are generally the means of bringing together a grand as well as an interesting display of the lighter and more graceful of the Rose family. The collection of thirty-six bunches from Messrs. Paul & Son, The Old Nurseries, Cheshunt, and awarded 1st prize, was magnificent, and constituted a great attraction to the ladies, and any whose time was not wholly absorbed by a critical examination of the florists' varieties, Noisettes, mosses, H.T.'s, Gallica, China, evergreen, Bourbon, and hybrid Bourbon. Polyantha Roses were all represented, and shown with long sprays containing some of the foliage of the plants. The 2nd prize was taken by Messrs. Geo. Cooling & Sons, Bath.

For eighteen trusses, distinct varieties, the 1st prize was taken by Mr. Chas. Turner, Royal Nurseries, Slough, with fine trusses. Messrs. D. & W. Croll, Dundee, were 2nd.

Open Classes.—Mr. Jno. Mattock was 1st for twelve bunches of Roses suitable for buttonholes, not less than six varieties, and had Madame de Watteville, Madame Hoste, Anna Olivier, Rubens, Marie Van Houtte, Souvenir de S. A. Prince, l'Ideal, and W. A. Richardson; Mr. F. Cant was 2nd.

The best nine bunches of single-flowered Roses, distinct, came from C. J. Cuthell, Esq., who showed a very nice lot of these effective varieties. He had rubrifolia, a small-flowered rose-coloured variety; lucida (rose), macrantha (good-sized white), Alpina (rose), moschata alba, Rosa rugosa alba (extremely large), Rosa rubiginosa, and indica (crimson); the Right Hon. Lord Penzance, Eashing Park (gr., Mr. Basket), was 2nd.

Display of Roses.

The best display to be arranged on a space not exceeding 5 feet by 3 feet, with Rose foliage only for decoration, was also best shown by C. J. Cuthell, Esq. Chapel Croft, near Dorking; Mr. Geo. Mount was 2nd, and Mr. John Mattock 3rd.

Medal Roses.

The Silver Medal awarded for the best hybrid Rose exhibited by a nurseryman was taken by Mr. B. R. Cant, for his large and splendid blooms of Marie Baumann; and Mr. Geo. Prince of Oxford, received a like honour for the best Tea or Noisette, which was awarded to a capital bloom of The Bride.

Amateurs' Classes.

Open to all, irrespective of the number of plants they grow:—

For forty-eight singles, trusses, the Amateurs' Trophy class, Dr. S. P. Budd, Bath, was a good 1st, a very creditable lot, but not so heavy and well-finished as this class usually calls forth. Mr. W. Drew, Uplands, Ledbury, was 2nd, his best flowers being S.-M. Rodocanachi, Lady Mary Fitzwilliam, Niphetos, Mrs. J. Laing, The Bride, Charles Lefebvre, U. Brunner, Horace Vernet, Mons. Noman, and Marie Verdier; Rev. J. H. Pemberton being a good 3rd, and having splendid examples of Her Majesty, Mrs. J. Laing, A. K. Williams, Charles Lefebvre, H. Vernet, and Caroline Testout.

For thirty-six single trusses, T. B. Haywood, Esq., Woodhatch Lodge, Reigate (gr., Mr. Salter), was a good 1st, his best blooms being F. Michelon, S.-M. Rodocanachi, Her Majesty, Louis Van Houtte, and Duchesse de Morny. In this class Dr. Budd took 2nd place, Rev. J. H. Pemberton 3rd. Mr. Tate was disqualified for duplicating Marie Baumann.

For twenty-four distinct single trusses, Mr. T. Hobbs, Easton, Bristol, was 1st, having good flowers of Victor Hugo, U. Brunner, Marie Verdier, and Merveille de Lyon; 2nd, Miss F. T. Baker, Holmfield, Reigate, but the difference between the two lots was very slight; 3rd, the Rev. A. Foster Melliar, Ipswich, who had a good selection as regarded colour.

For twelve distinct varieties, three of each, Dr. Budd was again 1st, with an exceedingly bright lot, Earl of Dufferin, A. K. Williams, and Star of Waltham being the best; Mr. W. Drew, Ledbury, 2nd. Five competitors were unsuccessful.

For twelve single trusses of any H. Perpetual or H. Tea, T. B. Haywood, Esq., was 1st, with Her Majesty; J. Gurney Fowler, Esq, being 2nd, with a good box of Marie Finger; and Mr. W. Drew, 3rd, with S.-M. Rodocanachi.

Open only to growers of less than 2000 plants of exhibition varieties, as defined by the National Rose Society:—

Twenty-four distinct single trusses, 1st, Rev. H. A. Berners, Harkstead Rectory, Ipswich, took 1st and secured the Turner Memorial piece of Plate; Mr. A. Slaughter, Jarvis Villa, Steyning, 2nd; and Mr. A. M. Bethune, Denne Park, Horsham, 3rd. In this class a most unfortunate mistake was made, J. Gurney Fowler, Esq., Glebe Lands, South Woodford, Essex, having staged his box here, which should have been in class 7. The correct card was attached but the box was wrongly placed. This was the more annoying because it would also have been 1st in its own class, and was well in front of Dr. Budd's. An extra prize was awarded.

Eighteen distinct singles, Mr. R. E. West, Reigate, staged an excellent lot, E. Y. Teas, A. K. Williams, Prince Arthur, Annie Wood, Madame V. Verdier, Merveille de Lyon, and Charles Lefebvre, being very bright.

Eight distinct trebles, 1st, Rev. H. Berners, Ipswich, whose best trebles were Alfred Colomb, Earl of Dufferin, and Her Majesty.

For twelve distinct singles, Mr. Osmond G. Orpen, West Bergholt, Colchester, was a splendid 1st, winning the Harkness Challenge Cup with good blooms of S.-M. Rodocanachi, Maréchal Niel, Souvenir d'Elise Vardon, U. Brunner, Madame de Watteville, Mr. John Laing, Ernest Metz, Duke of Teck, Souvenir de S. A. Prince, Jean Liabaud, Madame Hoste, and Madame Cusin; Mr. H. Foster, Ashford, was 2nd; Mr. Conway Jones, Hucclecote, Gloucester, 3rd. This class was strongly contested, nine others showing in creditable form.

Open only to growers of fewer than 1000 *plants of exhibition varieties.*—For nine distinct single trusses called forth no fewer than twelve boxes, the result going as follows: 1st, Rev. H. B. Biron, Lympne Vicarage, Hythe; 2nd, Mr. O. G. Orpen, West Bergholt, Colchester, very clean, but not so heavy.

For six distinct, three of each, Mr. Orpen was a good 1st.

Open only to growers of fewer than 500 plants of exhibition varieties:—

For nine distinct single trusses, Mr. H. Foster, Ashford, was 1st, with grand flowers of Sultan of Zanzibar, Gabrielle Luizet, Horace Vernet, and Marguerite Brassac among others. Eight other competitors.

For six single trusses, 1st, Rev. G. E. Jeans, Shorwell Vicarage, Isle of Wight.

Four distinct trebles, 1st, W. D. Freshfield, Esq., Reigate.

Extra classes for amateurs.—Six Roses, of any one Hybrid Perpetual or Hybrid Tea, Mr. A. F. Grace, 1st, with Merveille de Lyon; Mr. J. Bateman, Archway Road, N., 2nd, with Marchioness of Londonderry; Mr. C. J. Grahame, Coombe Road, Croydon, 3rd, with Mrs. J. Laing; and Mr. Conway Jones, Hucclecote, Gloucester, 4th, with the same variety.

Six distinct singles, open only to amateurs who have never won a prize at the National Rose Society exhibitions:—1st, Mr. E. R. Smith, Milford Lodge, Muswell Hill.

For singles, open only to members who have joined the National Rose Society since the last Crystal Palace Show, Mr. A. F. Perkins, Oak Dene, Holmwood, was a good 1st.

For six singles, distinct, to be grown within 8 miles of Charing Cross, Mr. Rivers H. Langton, Hendon, N.W., was 1st with one of the very best in the show. The 1st prize in this class is a piece of plate, presented by Mr. E. Mawley, Berkhamsted, Hon. Secretary of the Society.

A class for twelve singles, grown within 11 miles of Charing Cross, Lieut.-Colonel J. De La Mare, Church Road, Croydon, was a good 1st.

In the class for six distinct, single trusses, the Rev. J. H. Pemberton, Havering-atte-Bower, Essex, was 1st with Caroline Testout, Marchioness of Londonderry, Spenser, Duke of Fife, Margaret Dickson, and Marchioness of Dufferin. Lord Penzance also competed, showing a stand of his seedlings, the only two which commended themselves to us being Henry Gow and Columbine.

Tea and Noisette Section.

Amateurs (open to all, irrespective of the number of plants grown).—Eighteen distinct, single trusses, 1st prize, a challenge trophy and £4. This was won by the Rev. H. A. Berners, Harkstead Rectory, Ipswich. All of the flowers were good, but the following were extra, Catherine Mermet, The Bride, Madame Hoste, Edith Gifford, Ethel Brownlow, Madame Cusin, Etoile de Lyon, Niphetos, and Mrs. J. Wilson. A capital 2nd was found in Mr. A. Hill Gray, Beaulieu, Newbridge, Bath, who had grand flowers of C. Mermet, Comtesse de Nadaillac, Souvenir d'un Ami, and its white sport, and The Bride. 3rd prize went to Rev. F. R. Burnside, Birch Vicarage, Hereford, who had splendid flowers of Madame de Watteville, Souvenir d'Elise Vardon and Cleopatra.

Twelve distinct single trusses; 1st, Rev. Foster Melliar, Ipswich, which town seems invincible for Teas this season. In this stand was found the best Tea or Noisette in Souvenir d'Elise Vardon, a splendidly built-up flower, to which was awarded the Silver Medal. Rev. H. A. Berners, also of Ipswich, was a close 2nd, his Edith Gifford and Madame Bravy being very good. Dr. Budd, Bath, was 3rd. The competition here was numerous.

For twelve distinct, three of each, a piece of plate is given, as a memorial of the late Rev. the Hon. J. Townshend Boscawen, and was won by the Rev. H. A. Berners, Harkstead Rectory, Ipswich. Mr. A. Hill Gray, Newbridge, Bath, was a remarkably close 2nd.

Nine blooms of any Tea or Noisette, 1st, Rev. H. Berners, with Maréchal Niel; 2nd, Rev. Foster Melliar; 3rd, Mr. E. M. Bethune, Horsham, both with Edith Gifford.

Open only to Growers of fewer than 500 *Plants of Exhibition Varieties.*—A piece of plate presented by the Rev. F. R. Burnside, for twelve Tea or Noisettes, single blooms, was won by Mr. O. G. Orpen, West Bergholt, Colchester, whose best flowers were Madame Hoste, Marie Van Houtte, Caroline Custer, Madame Cusin, Francisca Krüger, and Souvenir de S. A. Prince.

For nine distinct singles, C. E. Shea, Esq., gave 1st and 2nd prizes, which were won by Mr. Conway

Jones, Hocclecote, Gloucester, and Miss F. T. Baker, Holmfels, Reigate.

Six distinct trebles, Mr. O. G. Orpen, Colchester, 1st.

Open only to Growers of fewer than 200 *Plants of Exhibition Varieties.*—Nine single blooms, 1st, Rev. J. R. Buchanan, Herne Vicarage, Canterbury.

Six singles distinct, 1st, Mr. H. Foster, 28, North Street, Ashford; 2nd, Rev. G. E. Jeans, Shorwell Vicarage, Isle of Wight.

Extra Classes for Amateurs:—

For six blooms of any Tea or Noisette, Mr. Orpen was 1st, with splendid examples of Madame Hoste; Mr. E. Horne, Park House, Reigate, 2nd, with Madame Bravy.

In a class open only to amateurs who have never won a prize at the National Rose Society's shows, for six single trusses, 1st, Mr. G. W. Cook, Glenthorne, near Southgate.

For six distinct Teas, grown within 8 miles of Charing Cross, prizes presented by Messrs. Paul & Son, Cheshunt, Rivers H. Langton, Esq., Hendon, was 1st, and Mr. J. Bateman, Archway Road, N., 2nd.

The best Tea or Noisette was found in the Rev. A. Foster Melliar's Souvenir d'Elise Vardon; and the best H. Perpetual or H. Tea, in a superb flower of Margaret Boudet, from Dr. Budd. Both of these blooms were in 1st prize stands.

AMATEURS' GARDEN ROSES.

As usual, these attracted much attention. Lord Penzance presented a Silver Cup as 1st prize for eighteen varieties, not less than three trusses of each. Mr. O. G. Orpen, Colchester, was successful, and staged good examples of l'Ideal, Madame Capucine, W. A. Richardson, Bardon Job, Perle d'Or, Gustave Regis, Maiden's Blush, and others.

For nine bunches, Mr. J. Mallender, Hodsock Priory, Worksop, was 1st.

A box of the old Gallica Roses from Lord Penzance clearly demonstrated the advance we have made in the queen of flowers.

MISCELLANEOUS.

There were not many exhibits from nurserymen staged only for exhibition, and by far the most important of these was an extensive collection of cut Roses, and a few plants in pots from Messrs. Wm. Paul & Son, Waltham Cross, Herts, and staged immediately under the orchestra. The blooms were arranged in boxes and baskets surfaced with moss. Amongst others were noticed baskets of the Tea-scented Sunset, of Spenser, a very good H.P.; Madame Hoste (T.), Madame Alfred de Rougemont (H.P.), a capital white variety for cutting; The Queen (T.), pure white. Messrs. Paul's Clio (H.P.), a large flesh-coloured flower, one becoming very popular amongst growers; Marquise de Salisbury, a crimson semi-single variety, and very brilliant. There were many other new and older varieties, and interspersed were small Palms and some Ferns, which added to the attractiveness of a good exhibit. Mr. William Rumsey, Joyning Nursery, Waltham Cross, Herts, had a stand of capital Rose blooms in large variety. H.P.'s were most represented, and there were about two dozen Teas, most of them first-rate specimens. Messrs. Geo. Jackman & Sons, Woking, had a small collection of Roses, consisting chiefly of H.P. and garden varieties. Messrs. J. Cheal & Sons, Lowfield Nursery, Crawley, contributed a show of hardy flowers, including varieties of Viola, shown on velvet-covered stands. Messrs. Harkness & Sons, Bedale, Yorkshire, had a collection, including spikes of Delphinium flowers in variety, Gaillardias, single Pyrethrums, Iceland Poppies, Campanula persicifolia grandiflora alba, Heuchera sanguinea, Scabiosa caucasica, Astrantis major, &c.

ROYAL HORTICULTURAL.

JULY 10.—The usual fortnightly meeting was held at the Drill Hall, James Street, Westminster. Exhibits were not quite so numerous as usual, and there were no Roses of any description shown. Several competitive classes for hardy flowers had been arranged, and there were very fine exhibits of succulent plants, these latter constituting a very exceptional feature of the show.

Floral Committee.

Present: W. Marshall, Esq., in the chair; and Messrs. J. Laing, H. Herbst, C. T. Druery, G. Stevens, C. F. Bause, R. B. Lowe, J. T. Bennett-Poë, H. Cannell, W. Bain, J. Walker, H. Selfe Leonard, C. E. Shea, C. Beckett, C. Noble, H. Turner, and J. Jennings.

Messrs. Wm. Cutbush & Son, Highgate Nurseries, London, staged an immense collection of hardy flowers. The varieties almost exhausted the plants of this description now in flower, and conspicuous amongst these, were bunches of Erigeron macranthum, Centaurea macrocephala, Prunella Webbiana, Veronica spicata rosea, a pretty rose-coloured variety, Erigeron speciosus superbus, dwarf varieties of Dianthus, Orchis pyramidalis, &c. (Silver Banksian Medal).

The same firm also contributed a fine group of Carnations in flower, consisting of well-grown plants of the Souvenir de la Malmaison type; also Uriah Pike, and many other varieties (Silver Flora Medal).

A grand exhibit of Tuberous Begonias was staged by Messrs. John Laing & Sons, Forest Hill, S.E. The varieties, mostly double, included some of fine excellence. Awards of Merit were given to Lord Dunraven, a good flower of extra deep crimson; to Neatness, a medium-sized crimson-scarlet flower of especial good form; and to Laing's Fringed White, a large white single variety with deeply-fringed petals. Amongst other varieties worthy of notice, may be mentioned, Lady Grimthorpe, an immense rose-coloured single variety. Mr. William Miller, an intense crimson single flower; G. A. Loveday, a rose double; and Mrs. French, a pale lemon double, of good size (Silver Flora Medal).

From Mr. Walter Salmon, Ivy Cottages, Elder Road, West Norwood, came a good number of cut spikes of Antirrhinum in variety, and bunches of Sweet Williams (Bronze Banksian Medal).

A number of Sweet Williams bloom, from Mr. J. Walker, Thame, Oxon, were sent as illustrating his strain of Auricula-eyed flowers, and were of very great merit (Bronze Banksian Medal).

Sir Trevor Lawrence sent several interesting things, amongst which were five spikes of Pentstemons, in as many varieties, of a splendid strain, bearing extra large and well-coloured flowers. Jean Mace, a flower more than 2 inches across, and of deep crimson, with silvery throat, was recommended an Award of Merit. A number of plants in flower of Exacum affine were awarded a Botanical Certificate. The plants were about 1 foot high, and bore numerous axillary small flowers of Gentian-blue, with yellow anthers. A plant of Exacum macranthum in flower accompanied these. A pan of Saintpaulia ionantha received a like reward.

W. E. Hall, Esq., Coker Court, Yeovil (gr., Mr. S. Kidley), had some flowering sprays of varieties of Bougainvillea, said to be seedlings from B. glabra, and others from B. spectabilis. One of these varieties, of extra dark colour, was recommended an Award of Merit. Other varieties were lighter than the type.

A Clematis named Lady Ashcombe, shown by Messrs. J. Ivery & Son, Dorking, Surrey, and recommended an Award of Merit, was a pretty blue flower, of good size and substance.

Messrs. Sander & Co., St. Albans, showed a great mass of Bougainvillea glabra Sanderiana in a large pan. The plants were about 4 feet high, and were literally covered with flowers. They were raised from cuttings taken in August last, and planted in a bed in a hothouse. Sonerila Mrs. H. Walter, the result of a cross between S. orientalis and S. Hendersonii elegans, received an Award of Merit; it is a vigorous-growing variety, and the leaves are thickly spotted with silvery-white.

A collection of Sweet Peas, in variety, from Mr. Eckford, Wem, Salop, abounded in most pretty and delicate-coloured flowers, which presented almost innumerable shades of rose, pink, blue, purple, and some were pure white. Countess of Powis, rose-coloured, with deeper-coloured veining, and a large flower, received an Award of Merit; as did Salopian, a crimson flower, curiously veined with dark purple. Stanley is almost black, so intense is the velvety-purple of the flower. Many others are of great excellence.

Messrs. R. Wallace & Co., Colchester, had a grand exhibit of Calochortus varieties, one of the best being Calochortus venustus citrinus, a very pretty yellow variety; C. v. roseus, and C. v. oculatus. Calochortus splendens atroviolaceus is a little darker in colour than the type, itself a very charming flower; C. luteus, and C. l. concolor, the latter a yellow variety, were also shown. Also a grand lot of garden Lilies; conspicuous among these were flowers of L. Thunbergianum Horsmani, in which the colour is remarkably developed—this was awarded a First-class Certificate; L. T. bicolor, L. T. Van Houttei, and L. T. Prince of Orange, are all desirable varieties (Silver Banksian Medal).

An Award of Merit was obtained for Chrysanthemum maximum, a large-flowering white variety, exhibited by Mr. M. Prichard, Christchurch.

Messrs. Jas. Veitch & Sons, Chelsea, obtained a First-class Certificate for Rubus japonicus tricolor, exhibited as a very slender-growing trailing plant. The stems and leaf-petioles were rose-coloured, and a good proportion of the smaller leaves were entirely white, but some of the larger ones had considerable green in them. Rhus Cotinus, Quercus cuspidata, in flower; Stuartia pseudo-Camellia were also included, and a collection of flowers of Carnations and Picotees of high merit. We must not omit mention of a handsome plant of Nepenthes mixta (figured in the *Gardeners' Chronicle*, January 14, 1893, p. 47), carrying some capital pitchers. A collection of hardy flowers in great variety came from the same firm. Several good Phloxes, bunches of Centaurea macrocephala, Bupthalmum speciosum, Cephalaria alpina, Malva moschata alba, Morina longifolia, Monarda didyma, Delphinium nudicaule, Linum flavum, Gaillardia hybrids, Papaver nudicaule vars., and many others. Also some pretty coloured and large varieties of Campanula Medium, single, and double. Some bunches of Papaver glaucum created a vivid blaze with their extremely showy crimson flowers (Silver Flora Medal).

Flowers of Calochortus venustus vesta, C. v. rosea, and C. v. purpurascens were sent by G. F. Wilson, Esq., Weybridge. C. v. vesta has large flowers of creamy-white, with yellow or brown throat; it had grown 3 feet high (Award of Merit). C. v. purpurascens has also large flowers, the creamy-white in this case having a little yellow; the centre is marked with red and brown (Award of Merit).

Messrs. H. Cannell & Sons, Swanley, contributed largely to the display at this meeting. In addition to a very exceptional group of Cactaceous and succulent plants from this firm, came a good collection of Sweet Peas in numerous varieties, flowers of Arnebia cornuta, Statice Suworowi, Linaria reticulata aurea purpurea, a variety with rich purple-crimson and yellow flowers. Gypsophila elegans in white and rose variety were pretty, and some fine sprays of Canna blooms were included. From the same firm was also shown a collection of flowers of tall and dwarf Rocket Larkspurs of capital strain (Bronze Banksian Medal).

Mr. H. Burbidge, Grove Nursery, Westgate-on-Sea, showed plants of Coleus Westgate Gem, apparently a tolerably good decorative variety, but no award was made, there being so many good forms already grown.

Martin R. Smith, Esq., The Warren, Hayes, Kent (gr., Mr. Blick), exhibited splendid blooms of five varieties of Carnations; large flowers of King Arthur, a crimson-flowering variety which obtained an award at Chiswick last year, were magnificent, and although the flower is so large, the calyx is invariably good as shown. Horace Trelawney is the name of a handsome rose variety, said to be as large as King Arthur when fully developed, but as shown on Tuesday the blooms were not fully expanded. An Award of Merit was given to Winifred, a good-sized flower, of fine form and delightful colour, perhaps best described as apricot-salmon.

Miss A. Debenham was the only exhibitor in the amateur's class for eight bunches, and she was rightly awarded a 1st prize.

For the Kelway Silver Medal offered for six varieties of Gaillardias, five blooms of each, there was but one exhibitor, Dr. P. H. Emerson, Claringbold, Broadstairs, the blooms were of good size.

The 1st prize in a competition class for twelve bunches of hardy herbaceous perennials was taken by Mr. G. H. Sage, gr. at Ham House, Richmond. His exhibits were highly commendable, and consisted of Eryngium Oliverianum, Lathyrus latifolius, Alstrœmeria chilensis, Erigeron speciosus, Coreopsis lanceolata, Gaillardia hybrida, Galega officinalis, Delphinium, Centaurea macrocephala, Malva moschata alba, and Lilium candidum. And Chrysanthemum maximum. The 2nd prize was won by Mr. S. Kidley, gr. at Coker Court, Yeovil, Somersetshire.

Messrs. H. Cannell & Sons, The Home for Flowers, Swanley, exhibited an unexpectedly-large collection of succulents, the plants occupying a space of tabling 30 feet by 3 feet, closely packed together—much too closely, in fact, for proper inspection. Among much that was hardly distinguishable from each other, we noted several distinct-looking subjects: Dasylirion gracile, Agave Ghiesbreghti, A. Victoriæ Reginæ, Aloe plicatilis, A. heteracantha, A. varie-

gata, A. distans, A. arborescens, Crassula monticola, Pilocereus Brunonniana, P. Houletti and P. senilis, Cereus rostratus, C. giganteus, and a large number of small plants of Stapelia, Opuntia, Mesembrianthemum, Gasteria, Echinocactus, Mammillaria, Haworthia, &c. (a Flora Medal).

Mr. C. G. Ludford, of Fern Lea, Four Oaks, Sutton Coldfield, showed a collection of relatively large plants, nicely grown, of Echinocactus Grusoni, E. Leconti, E. cornigerus, with remarkable ferocious-looking brown curved spines; E. pilosus, E. texensis, Opuntia leuchotricha, several Cereus, including Eriophorus and erectus; and a fine lot of Pilocerus senilis (a Banksian Medal).

Mr. W. Singer, Frome, Somerset, had a small collection of succulents, consisting of Echinocactus, Mammillaria, Pilocereus, Euphorbia, Opuntia, including O. cylindrica cristata; Anhalonia prismatica, Cereus glomeratus, and a plant of Echinocereus pectinata in bloom (a Banksian Medal).

Mr. G. Pritchard, 78, Goldwin Road, Forest Gate, had a collection consisting of many choice and rare species and varieties, as Opuntia bicolor, O. cylindrica, O. monocantha, O. cochinilifera, O. Emoryi, and others; Cereus speciosissimus, C. Napoleonis quadrangularis, Phyllocactus Kaufmanni, P. alatus, P. cæspitosus, P. cruentus, and numbers of Cereus, including the easily-flowered Mallisoni, many Echinocactus and Mamillaria (Flora Medal).

M. P. Rebut had a small collection of Cereus, including C. Peruvianus monstrosus, C. marginatus, C. Damortieri, Opuntia senilis, and a small number of Echinocacti and Mamillaria.

It was remarked that scarcely any of the foregoing had flowered, or showed signs of doing so.

Orchid Committee.

Present: H. J. Veitch, Esq., in the chair, and Messrs. Jas. O'Brien (Sec.), De B. Crawshay, R. Brooman-White, E. Hill, H. M. Pollett, H. Ballantine, Chas. Pilcher, H. Williams, Walter Cobb, T. W. Bond, H. J. Chapman, T. B. Haywood, S Courtauld, Baron Schroder, and Dr. Maxwell T. Masters, F.R.S.

Messrs. Jas. Veitch & Son, Royal Exotic Nursery, King's Road, Chelsea, exhibited some fine new hybrid Orchids, among which were Lælio-Cattleya × Timora (C. labiata Luddemaniana ♂, L. pumila Dayana ♀), a very showy Orchid of neat habit. The sepals and petals, which were of good substance, were of a bright rosy-lilac, the lip white at the base and with a rich plum-purple front, and edges to the side-lobes (First-class Certificate). Another worthy plant was Thunia × Veitchiana superba (T. × Veitchiana × Bensoniæ). Beside it, T. Veitchiana (Marshalliana × Bensoniæ) was shown, and the large rose, white, and yellow flowers of the second cross showed marked improvement (Award of Merit). Messrs. Veitch also showed Disa × Diores (Veitchii ♀, grandiflora ♂), a pretty hybrid of the same form as D. grandiflora, but with the lower sepals much lighter in colour, and the large odd sepals nearly white. The committee requested to see it again when stronger. The beautiful Psalænopsis × Artemis (rosea ♂, amabilis ♀) was also shown by Messrs. Veitch.

Messrs. W. L. Lewis & Co., Chase Side, Southgate, had an extensive and fresh-looking group of showy Orchids, for which they were awarded a Silver Banksian Medal. In it were Cattleya labiata Gaskelliana in great variety, including one pretty white form; a very rich blue-lipped form of Zygopetalum maxillare Gautierii, Lælia × Amanda, Bifrenaria Harrisonæ, B. vitellina, Cattleya Eldorado, Cypripedium × Patersonii (Lowii × Dayanum). C. × macropterum, Odontoglossum citrosmum, Dendrobium suavissimum, Oncidium curtum, &c.

One of the most interesting plants shown, from a botanical point of view, was Vanda Rocklingiana, Rolfe, n. sp., from Messrs. Hugh Low & Co, with rather small brown flowers, the narrow base of the lip being white, and the front lobe bearing two circular fringed plates (Botanical Certificate). Messrs. Low also showed Cypripedium × Alice (Stonei × Spicerianum) and C. × javanico superbiens.

Baron H. Schroder, The Dell, Egham (gr., Mr. H. Ballantine), showed a fine spike of the richly-spotted Odontoglossum crispum Ballantinei, still one of the best of its class.

Messrs. F. Sander & Co., St. Albans, staged a group of rare Orchids, in which were a noble plant of Dendrochilum (Platyclinis) filiforme, with one hundred and twenty of its elegant drooping yellow racemes (Cultural Commendation); Cattleya Gaskelliana rubra, a very richly-coloured form; the pretty new C. Batalinii, the chaste white C. Gaskelliana virginalis, Renanthera matutina, Zygopetalum intermedium, Saccolabium Hendersonianum, Cypripedium Farishii, C. × macropterum, C. × Youngianum, Oncidium macranthum, Sobralia xantholeuca, Dendrobium formosum giganteum, &c.

R. I. Measures, Esq., Cambridge Lodge, Flodden Road, Camberwell (gr., Mr. H. J. Chapman), showed Masdevallia corniculata, M. demissa, M. Gaskelliana, M. trichæte, and M. muscosa.

From the Royal Gardens, Kew, came cut examples of the Kew hybrid Disas, which are now making such a grand show in the lobby of the Orchid-houses there; they comprised Disa × Premier (Veitchii × tripetaloides), D × kewensis (grandiflora × tripetaloides), and D. × Langleyensis (similar to that raised by Messrs. Veitch) (racemosa × tripetaloides); their elegant spikes of numerous carmine or magenta-rose flowers proclaim them among the best garden subjects of recent times (Vote of Thanks).

C. J. Lucas, Esq., Warnham Court, Horsham, showed the pretty white and green Ornithocephalus grandiflorus (Botanical Certificate).

The Right Hon. Joseph Chamberlain, Highbury, Moor Green, Birmingham (grower, Mr. H. Burberry), showed cut spikes of Miltonia vexillaria highburyensis, a variety of the M. v. superba class, and with very rich maroon blotch and lines at the base of the lip.

W. Thompson, Esq., Walton Grange, Stone, Staff. (gr., Mr. W. Stevens), showed Cattleya Gaskelliana, "Nellie," a beautiful white form with a small purple spot on the front of the lip (Award of Merit), and a very beautifully blotched variety of Odontoglossum crispum.

De B. Crawshay, Esq., Rosefield, Sevenoaks (gr., Mr. S. Cooke), showed Cattleya Gaskelliana "Mrs. De B. Crawshay," a pure white variety with a slight marking of rose on the lip; four grand forms of Odontoglossum Harryanum and O. Pescatorei, with a very strong and much-branched spike.

J. W. Temple, Esq., Leyswood, Groombridge (gr., Mr. Bristow), showed a fine dark form of Cattleya Warscewiczii, with four flowers on a spike; a very large light-variety of the same; two plants of C. granulosa Du Buyssoniana, and a small plant of Fernandesia robusta.

F. Wigan, Esq., Clare Lawn, East Sheen (grower Mr. W. H. Young), showed Cypripedium × Wiganianum, a good flower, of unknown origin; C. × macropterum; and Dendrobium Leeanum atro-purpureum, a very rare and beautiful variety.

C. W. Fincken, Esq., Hoyland Hall, Barnsley (gr., Mr. J. Milburn), staged a fine form of Cattleya Rex, with a four-flowered inflorescence.

F. W. Moore, Esq., Royal Botanic Gardens, Glasnevin, Dublin, sent Phajus Henryi, with rose-pink flowers, darker on the edge of the lip, which bears a prominent yellow callus.

Chas. Ingram, Esq., Elstead House, Godalming (gr., Mr. T. W. Bond), showed his fine and richly-coloured Lælio-Cattleya × Ingrami, Cypripedium × T. W. Bond (Curtisii × hirsutissimum), a very fine hybrid; and cut flowers of a striped form of Cattleya Mossiæ.

Reginald Young, Esq., Sefton Park, Liverpool, sent a cut spike of a very richly-coloured Cattleya Warscewiczii; a similar form being sent by W. Ellis, Esq., Hazelbourne, Dorking (gr., Mr. Masterton). Mr. Young also sent flowers of Cattleya granulosa; and Dr. Davis, Barming Heath, Maidstone, Kent, showed a very fine variety of Odontoglossum cristatellum.

Fruit Committee.

Present:—Philip Crowley, Esq., in the chair; and Messrs. T. F. Rivers, Harrison Weir, Rev. W. Wilks, Geo. Bunyard, G. W. Cummins, Jas. Cheal, Geo. Taber, T. Saltmarsh, A. Dean, J. A. Laing, G. H. Sage, F. Q. Lane, H. Balderson, and Dr. Robert Hogg.

A splendid collection of Cherries and Strawberries, grown outside, was sent by Mr. Owen Thomas, gr. to Her Majesty at the Royal Gardens, Windsor. The following varieties of Cherries were of first-class quality: Archduke, Dowaton, Frogmore, early Bigarreau, Reine Hortense, Florence White Heart, Late Duke, Bigarreau Napoleon, Elton, Governor Wood, Monstrous Bigarreau, Knight's Early Black, Black Eagle, Black Tartarian, and May Duke. The Strawberries included La Grosse Sucrée, Prince of Wales, Sir Chas. Napier, Viscountess Héricart de Thury, Aromatic, Keen's Seedling, Laxton's Noble, Waterloo (good, though early), Sir Harry, The Countess, Dr. Hogg, Sir Joseph Paxton, Unser Fritz, and James Veitch. Two seedling Melons were included, one obtained from a cross between High Cross Hybrid and a seedling, and another from High Cross Hybrid and Countess; but perhaps these will be exhibited on a future occasion. Extraordinary Walburton Admirable Peaches of immense size were also included in this collection (Silver Knightian Medal).

Messrs. T. F. Rivers & Son, Sawbridgeworth, showed some capital orchard-house trees in pots, including Belgian Purple and Jefferson's Plum, Bigarreau Monstueuse de Mezel, Bigarreau Noir de Guben, Bedford Prolific Cherries, and two splendidly-cropped trees of Early Rivers Nectarine from the cold-house (Silver Knightian Medal).

Messrs. J. Veitch & Sons, King's Road, Chelsea, contributed a fine collection of fruit, consisting of Cherries, Gooseberries, Strawberries, Raspberries, &c. The Cherries were produced from pyramids in the open, though they might easily have been mistaken for orchard-house fruits. There were twenty-three varieties staged, and the following were especially good:—Pale-coloured: Frogmore Early Bigarreau, Cleveland Bigarreau, Early Red Bigarreau, Mammoth, and Governor Wood; deep red: Early Red Gem, Baumann's May; Duke section: May Duke, Archduke, Empress Eugénie, and Nouvelle Royale; deep black: Black Eagle, Black Hawk, Knight's Early Black, and Bigarreau de Chreken. A spray of May Duke was sent, to show an extraordinary crop. There were six varieties of Currants, Mammoth, La Versailles, and Cherry red—all splendid reds; and one dish of capital White Dutch. Amongst twelve good dishes of early Gooseberries, the following were very fine:—Early Green Hairy, Early Sulphur, Green Overall, Bright Venus, and Forester. Dishes of Superlative Raspberry, and of Gunton Park, and Lord Suffield Strawberries, were also shown (Silver Knightian Medal).

Votes of Thanks were accorded to Mr. J. Miller, gr. to Lord Foley, Ruxley Lodge, Esher, for very good dishes of Brown Turkey Figs, Violet Hâtive and Elruge Nectarines, and Grosse Mignonne and Royal George Peaches; also to Mr. G. T. Holden, Rhyl, North Wales, for a collection of Cucumbers; to Mr. A. Harwood, St. Peter's Street, Colchester, for Red Companion Gooseberries; and to Dr. P. H. Emerson, Claringbold, Broadstairs, for a few vegetables, such as Carentan Carrots, Turnip-rooted Mustard, Florence Fennel, Turnip-rooted Parsley, and Agua dulce Beans.

Messrs. Steel & Son, Ealing Dean, sent bine and fruits of a Raspberry; and Colonel Archer Houblon, Welford Park, Newbury (gr., Mr. Ross), had a seedling Melon. A variegated Tomato plant was from Messrs. Collins & Gabriel, Waterloo Road, London.

Lecture on Cactaceous Plants.

In the afternoon a lecture was read by W. Singer, Esq., of Frome, Somersetshire. Mr. Singer, in commencing his paper, briefly described the reasons that impelled him to take up the cultivation of this class of plants. The bizarre appearance presented by most of the species, the beauty of their flowers, their slow rate of growth, and the fact that it was practicable for an ordinary amateur to grow a good number of varieties with a comparatively small area of glass. Considerable efforts were made by Mr. Singer to obtain a representative collection, most of the plants being got through foreign nurserymen. Incidentally, it was remarked that correspondence with the Botanic Garden authorities in Australia proved that there are few species indigenous to that part of the globe. A collection of about six hundred varieties was at last obtained. The lecturer, addressing himself to the question of compost most suitable to the plants, remarked upon the unanimity of British writers upon the subject, in recommending the cultivators to strictly avoid any manure, and said that this advice was contrary to the practice of growers abroad. Letters were then read from many large growers in different parts of the world, in which they described the mode of culture followed. In many points these differed greatly, and even in the nature of the compost employed; but just as the Britishers were unanimous in proclaiming against the use of manure in any quantity, so the foreign writers were equally unanimous in favour of its use. Mr. Singer said he had no doubt whatever that it was correct practice to use something better than the very poor soil recommended by the English writers. Ventilation was alluded to as a more important point than compost, and the lecturer said that even during the whole winter the plants should receive plenty of air, and, to enable the cultivator to follow this practice with safety, the hot-water-pipes should be kept sufficiently warm. On

the continent it was the practice to place the plants outside during the summer, and shelter them only from the north wind. At this period they might have water freely and overhead, but in the winter it was essential that they be not wet, indeed, the plants would only require root-waterings during such season, about once a month. Of insects Mr. Singer mentioned the mealy-bug as being by far the worst enemy of these plants, and they are liable also to thrips and scale. Various methods were then described, by which mealy bug could be destroyed, and the opinions of the foreign growers freely quoted. Fir Tree oil, pure alcohol, very strong pepper, and a dipping solution made from flowers-of-sulphur and soap, were recommended in turn, and each of them required the greatest care that they do not injure the plants.

Upon the completion of the lecture, the chairman called upon Dr. Morris to open the discussion, and during some very interesting remarks, he said that the culture of the plants was mainly a question of heat and moisture. Without a sufficiency of the former they would not succeed, and a little too much of the latter was sufficient to kill them.

Mr. W. Watson said that these plants would stand very much more moisture than was generally supposed. The plants would live if watered all the year round, the same as Pelargoniums, but to induce them to flower it became necessary to give them all possible light and sun, and to keep them dry for a season. Mr. Watson thought they could never be flowered freely in this climate, but the blooms, when they could be secured, would in some measure compensate the grower by their extreme beauty.

Mr. Irwin Lynch mentioned a practice employed by some cultivators with considerable success, of planting the species out [In beds or frames? Ed.] during the summer, and lifting and re-potting in the autumn. Such a method required the greatest care, or plants might be lost through making gross, unripened growth, which might afterwards decay.

EALING HORTICULTURAL.

July 4.—The 30th annual exhibition of this society took place on the above date, in the beautiful grounds attached to Hanger Hill House, and presented a large and creditable display.

Plants:—For a group arranged for effect in a space 12 feet by 6 feet: 1st honours were secured by Mr. W. Roberts, gr. to J. Harris, Esq., Braemar, with a bright well-grown beautiful and very tastefully disposed collection.

Groups, 6 feet by 4 feet: a pleasing arrangement from Mr. C. Edwards, gr. to W. Owen, Esq., The Elms, took 1st prize.

Foliaged plants lent a feature to the exhibition. For six specimens, Mr. C. Long took the premier position with some fine plants, his Crotons being admirably coloured.

In the class for four foliage plants, the prizes were taken by Mr. C. Edwards, Mr. W. Roberts, and Mr. T. Wiseman, with very creditable specimens.

For a specimen stove or greenhouse plant, remarkable for handsome foliage, the 1st prize was taken by Mr. R. Dean, Ealing.

For six Ferns, honours for very good specimens were divided between Messrs. S. Wickenden and W. Roberts. Four Ferns, 1st, Mr. W. G. Rickerd, gr. to T. Lilley, Esq., The Croft; 2nd, Mr. C. Long. Six specimen Coleus, well-grown and coloured plants, secured prizes to Messrs. C. Long, S. Wickenden, and Mr. J. Beasley. Some very fine specimens of Caladiums were shown by Mr. W. Roberts.

Foliage Begonias were a pretty feature, the chief prizes being taken by Messrs S. Wickenden and W. G. Rickerd; whilst in the flowering section, some excellently-flowered examples were contributed by Messrs. J. Beasley and C. Long.

Four flowering plants: Mr. W. Roberts gained 1st prize for some fine specimens.

Mr. Long secured the premier position for a specimen Fuchsia, and also for four Fuchsias in flower with tall well-furnished examples showing high culture.

Some very freely-flowered Gloxinias were sent by Mr. J. Beasley, to whom was awarded the 1st prize.

Mr. Beasley's 1st-prize bedding Pelargoniums were well done.

Cut Flowers.—The 1st prize for eighteen Roses (Gold Medal of the National Rose Society), was taken by Mr. C. Edwards, gr. to W. Owen, Esq., with a beautiful lot of flowers.

Fruit in collections and single dishes made an interesting and nice display, the principal exhibitors being Mr. S. Wickenden, Mr. C. Edwards, and Mr. W. G. Rickerd.

Vegetables, too, were abundantly and well shown, Mr. W. Roberts taking 1st prize (offered by the society), for a creditable collection, whilst that offered by Messrs. Sutton & Sons for a collection was well won by Mr. C. Edwards.

The cottagers, as usual here, made a very good display of vegetables, their productions comparing very favourably with those sent by professional growers.

WORTHING.

July 4.—This is a show more particularly for cottagers and school children, although several larger classes are included. The competition was so keen and numerous that the committee felt constrained to double the prizes among those for children. Wild flowers and table decorations were exceptionally good; so also were the groups and the Grapes. In the open classes for a group not exceeding 60 sq. feet, Mr. J. Rolfe, Mr. C. Short, and Mr. G. Collins were successful. Mr. Short was also 1st for six Exotic Ferns, for Begonias, Gloxinias, and Petunias. Mr. J. Rolfe and Mr. A. Gadd were other prominent prize winners for plants. There was only one competitor for Roses in the open classes, and Mr. A. Slaughter had matters entirely his own way. Mr. Laker and Mr. Johnson took first honours respectively for white and black Grapes. Miss E. F. Shiffner, Lewes, was 1st for Carnations; Mr. Short for herbaceous flowers, and Mrs. Johnson for table decorations.

Amateurs.—For six plants, Mr. G. Heasman was 1st; Dr. E. S. Blaker, for Begonias; Mr. W. Court, for Pelargoniums; and Mr. Heasman, scored again for foliage plants. For twelve cut Roses, Dr. E. S. Blaker was a good 1st; Mr. H. Hargood and Mrs. Duncan following; but Mr. H. Hargood was 1st for six varieties. Mrs. Newington was a capital 1st for a bouquet, also for table decorations. For wild flowers, Miss N. Holden was 1st; the Misses C. & M. Snewin, in the class for thirty varieties with botanical and common names attached, had a grand lot. Mr. Heasman was 1st for a collection of vegetables, for Currants, and for Potatos.

CHERTSEY, WALTON, AND WEYBRIDGE HORTICULTURAL.

July 5.—The twenty-ninth annual show of the above was held at Ashley Park, Walton, the residence of J. S. Sassoon, Esq. The entries were more numerous than on any previous occasion, and the productions generally of great merit. Mr. Sassoon's gardener, Mr. Cook, was 1st for an ornamental group; and Major Brown's gardener, Mr. Carpenter, was 2nd. For groups big and little there were no fewer than eight competitors. Mr. F. Hopkins, Mrs. Wodderspoon's gardener, was 1st in a smaller class of groups; and Mr. Cheeseman, gr. to P. Reddell, Esq., Walton, was 1st for eight stove and greenhouse plants, his plants including a fine Dendrobium thyrsiflorum with thirty racemes; Mr. Cook was 2nd in this class, and 1st in that for four specimens and for foliage plants.

Ferns were numerous and good, the best six exotic species coming from Mr. Hopkins, and the best four hardy species from Mr. Millican, gr. to H. Cobbett, Esq., Addlestone. Mr. Cook had the best Caladiums—handsome plants. Freely-flowered Fuchsias, Gloxinias, and Achimenes were shown, and numerous were the exhibits of cut blooms of herbaceous perennials and Roses. Fruit was of good quality if not large in quantity, Mr. T. Osman, gr., Ottershaw Park, having the best six dishes.

Vegetables were plentiful, and Mr. J. Tomline, Mrs. Goldingham's gardener, was 1st for eight kinds.

AYLESBURY FLORAL AND HORTICULTURAL.

July 5.—This Society, which was established as far back as 1822, held its annual exhibition in the Corn Exchange on the above date, the spacious floor space of two large buildings being required to accommodate the exhibits. At the top of the Exchange were two large exhibits of choice plants, foliage and flowering. One sent by Mr. J. Smith, gr. to the Earl of Rosebery, Mentmore; the other from Mr. Jacques, gr. to Baron F. de Rothschild, M.P., Waddesdon Manor. The Malmaison Carnation, which may be regarded as the flower of the Rothschild family, was present in force; choice Palms, Caladiums, Ferns, predominating in both cases. Other miscellaneous exhibits consisted of some boxes of garden Roses from Mr. Charles Turner, Royal Nursery, Slough; Carnations, Picotees, and other flowers from Mr. John Walker, Thame; and a basket of Ferns from Messrs. Ingram, Whitfield & Co., nurserymen, Aylesbury.

About thirty of the leading classes were open to all. The best collection of plants arranged for effect, was shown by Mr. E. T. Mackrill. Miss Smith-Dorrien had the best collection of flowers in pots; Messrs. Ingram & Co. the best collection of plants, cut flowers, and fruits; Mr. E. T. Mackrill the largest and best collection of plants; the best six specimens of stove and greenhouse plants were from Mr. Robins, gr. to Colonel E. D. Lee, Hartwell House; some capital specimens of single Begonias came from Mr. T. Gurney; double Begonias from Miss Smith-Dorrien, who also had the best six specimens of Achimenes, admirably grown and bloomed; also the best six Coleus. Bedding Pelargoniums, large, well-grown, and flowered specimens, were a good feature also. In the members' division Mr. Shrimpton, gr. to Lady A. de Rothschild, took the 1st prize with a very fine collection of stove and greenhouse plants; and Mr. C. Threlfall had the best six Ferns.

Cut Flowers in the open classes were represented by very fine cut Roses, in thirty-six varieties, from Mr. J. Mattock, nurseryman, Oxford, and Mr. John Walker; but one of the most effective stands was that for six varieties of cut flowers, six of a kind, Mr. J. Walker taking the 1st prize with an excellently-arranged stand; and in a class for another collection of cut flowers, Mr. John Walker was also 1st. Roses were fairly well shown by amateurs.

Mr. Leopold de Rothschild's special prize for a collection of twelve dishes of fruit was won by Mr. Robins, who had excellent Grapes, Peaches, Nectarines, Strawberries, Melon, &c. Mr. Shrimpton took the 1st prize for three dishes of black Grapes, having well-finished Black Hamburgh. There were classes also for Peaches, Nectarines, Strawberries, and Cherries, and the more common hardy fruits.

Vegetables were extensively and finely shown. Messrs. Sutton & Son's special prizes for six dishes brought a good competition, Mr. Robins being 1st; Mr. W. Earl took Messrs. Webb & Sons' leading special prize for the same number of dishes; and Mr. L. N. Simms that of Messrs. James Carter & Co. Potatos, Peas, Beans, Carrots, Turnips were numerous. Table decorations of various kinds, ladies being the principal exhibitors of them, were also an interesting feature.

THE NATIONAL PINK (MIDLAND SECTION).

July 10.—So fine a display of laced Pinks was made in connection with the Wolverhampton Great Floral Fête on the above date that it served to recall the time when, thirty years ago, the flower was in the ascendancy in the Midlands. A considerable portion of tabling was filled with flowers, though the border varieties, which it was anticipated would be largely shown, were only sparingly represented.

There were three stands of laced Pinks in twelve varieties. Mr. A. R. Brown, Handsworth, Birmingham, was placed 1st with some excellent blooms, consisting of Princess Louise, very fine; Minerva, very fine; Arthur Brown, new, extra fine; Captain Kennedy, Ernest, Lustre, Harry Hooper, Bessie, Bertha, Emmeline, Amy, and Empress of India. Mr. C. F. Thurstan, Penn Fields, Wolverhampton, was a close 2nd, having some excellent blooms also, viz., Robert Houlgrave, new, very fine; Modesty, Princess May, new; Duke of York, Mrs. Richards, Amy, Dr. Braide, very pretty, having a wire edge of lacing, like a light-edged Picotee; John Dorrington, Empress of India, Boiard, and two unnamed seedlings. There were six stands in the class for twelve blooms in not fewer than six varieties: Mr. A. R. Brown was again placed 1st, with Boiard, Minerva, Bessie, Amy, Princess Louise, Arthur Brown, Ernest, Empress of India, Godfrey, and a few duplicates. There were five competitors with six distinct varieties: Mr. C. F. Thurstan taking the 1st prize with excellent blooms of Robert Houlgrave, Duke of York, Dr. Braide, Princess May, Amy, and a seedling. There were six stands of six blooms in not fewer than three varieties: Mr. C. F. Thurstan being again 1st with two blooms of Robert Houlgrave, Amy, Modesty, and two seedlings.

The best red-laced Pink was Robert Houlgrave, from Mr. C. F. Thurstan, it was also selected as the premier Pink in the show, and in addition was awarded a Certificate of Merit; it is a superb new red-

laced variety. The best purple-laced was Arthur Brown, a very fine new variety, and it was also awarded a Certificate of Merit. It was shown by the raiser, Mr. A. R. Brown.

The best six bunches of Pinks, border varieties, came from Mr. C. H. Herbert, who had Mrs. Lakin, white; Bertram, Amy, and Boiard, laced varieties; Ernest Ladhams, and the fine rose variety, Lord Lyons. Mr. C. H. Herbert had the best bouquet of Pinks, well arranged; Mr. M. Campbell being 2nd. A Certificate of Merit was also awarded to Princess May, a very attractive pale purple laced variety.

WOLVERHAMPTON HORTICULTURAL.

July 10, 11, 12.—Unsettled weather attended this great exhibition, still there was a very large attendance of visitors.

For sixteen stove and greenhouse plants, Mr. Cypher, Cheltenham, was 1st with a fine lot, especially an Aphelexis prolifera Barnesii, 7 feet in diameter, and marvellously well flowered; a grand Statice profusa, Ixora Williamsii, Erica ampullacea Barnesii, Anthurium Scherzerianum, Cycas circinalis, C. revoluta, and good Kentias; Mr. W. Finch, gr. to James Marriott, Esq., Coventry, was 2nd. with an excellent lot of plants, especially Crotons Queen Victoria and Disraeli; Ericas depressa, tricolor, and impressa; and Ixora Fraseri; Mr. J. Mould, Pewsey, in whose lot was a magnificent Kalosanthes coccinea, 7 feet through, 3rd.

For six stove and greenhouse plants in flower, Mr. Cypher was 1st, with Ericas Cavendishii and ferruginea major; Phœnocoma prolifera Barnesii, and Ixora Pilgrimii, all fine.

For six fine foliage plants, Mr. Cypher was 1st, with Kentia australis, Dasylirion acrostichon, Encephalartos villosus, and others.

Six Stove and Greenhouse Plants, Amateurs.—In the Classes for Gentlemen's Gardeners in the counties of Staffordshire, Warwickshire, Worcestershire, and Salop, in the above class, 1st, Mr. Finch, with a finely grown Phœnocoma, an Erica impressa, and a fine Croton, Prince of Wales, amongst them.

For eight Exotic Orchids, Mr. Cypher was 1st; amongst his plants were fine examples of Oncidium macranthum, Cattleya Mendeli, and C. gigas.

Groups.—Seven of these were arranged, each in a space not exceeding 450 square feet, and here Mr. Cypher was 1st, with a superb group, consisting of Palms, Orchids, Crotons, &c., perhaps rather heavy with flower; and he was closely followed by Mr. Edmunds, gr. to the Duke of St. Albans, Bestwood Park, Notts, whose arrangement was a trifle heavy and lacking the brightness of the first prize group, and a few more good flowering plants would have probably given him the first place.

In the class for a Group of Plants in a space not exceeding 400 square feet, Mr. Lovatt took the 1st prize with a somewhat dull and over-crowded exhibit, and this may be said of all the groups in this class.

In the *Amateurs' Classes* several groups were staged, and the other classes were well filled. Bouquets of wild flowers made by children were a very pretty display.

Roses were a striking feature of the exhibition, and of excellent quality. For seventy-two blooms, distinct varieties, Mr. B. R. Cant, 1st; Mr. F. Cant, 2nd; Messrs. Perkins & Sons, Coventry, 3rd.

For forty-eight distinct varieties, Messrs. D. Prior & Son, Colchester, 1st; Mr. B. R. Cant, 2nd; Messrs. Perkins & Sons, 3rd.

For thirty-six distinct varieties, the Rev. J. H. Pemberton 1st; Mr. B. R. Cant 2nd.

For twenty-four distinct varieties, Mr. B. R. Cant 1st, and Messrs. Townsend & Son, Worcester, 2nd.

For twelve new varieties, distinct, 1st, B. R. Cant; 2nd, F. Cant. For twelve dark Roses, one variety, 1st, B. R. Cant; 2nd, F. Cant. For twelve light Roses, one variety, Messrs. Townsend & Son 1st, B. R. Cant 2nd; all with Mrs. John Laing.

For twelve Teas, distinct, Messrs. Prior & Son 1st, Mr. F. Cant 2nd.

A special class for the most decorative arrangement of Roses brought out two exhibits; Messrs. Townsend & Sons 1st; Mr. Coombs, gr. to the Earl of Dudley, Himley Hall, 2nd.

For thirty-six Roses, distinct (amateurs), the Rev. J. H. Pemberton 1st, Mr. H. Robbins 2nd.

In the classes for bouquets, &c., Messrs. Perkins & Sons, Coventry, were deservedly 1st in the three classes.

Pansies and Violas.—Special prizes were offered for a collection of Pansies and Violas, a handsome Gold Medal as a 1st prize being given by Mr. Paul Lutz of Wolverhampton. Two fine and extensive exhibits were staged, Mr. S. Pye, florist, Garstang, Lancashire, who was 1st with a beautiful display; Mr. A. Lister, florist, Rothesay, 2nd. Several new varieties were exhibited in both collections. In the class for smaller collections, Mr. M. Campbell, florist, Blantyre, was 1st with an admirably set-up collection.

Fruit.

Open Classes.—For four bunches of Grapes, distinct, Mr. Goodacre, gr. to the Earl of Harrington, was 1st; his Black Hamburgh and Muscat Hamburgh were good, but Foster's Seedling and Muscat of Alexandria were not quite ripe. Mr. C. Froud, gr. to the Rev. Canon Coventry, 2nd; his Black Hamburgh Grapes were very fine. Mr. Bannerman, gr. to Lord Bagot, with small bunches of good quality, was 3rd.

For two bunches of White Grapes, Mr. McIndoe, gr. to Sir J. W. Pease, Bart., Hutton Hall, was 1st, with Muscats, rather small in berry and bunch; the Rev. Canon Coventry 2nd.

For two bunches of Black Grapes, Mr. Goodacre was 1st, with well-coloured Black Hamburgh; Mr. J. Wilkes, gr. to Mrs. Meakin, Stone, 2nd.

For a collection of ten varieties of fruit, Mr. Goodacre was 1st, with good Black Hamburgh and Foster's Seedling Grapes, an excellent Queen Pine-apple, a Melon, fine Cherries, Peaches, Nectarines, Figs and Strawberries; Mr. Bannerman, gr. to Lord Bagot, 2nd. There were seven entries in this class. Messrs. Laxton Brothers sent their new Strawberries.

In the fruit classes for gentlemen's gardeners there was a strong competition for six varieties. Mr. Bannerman was 1st, with good Grapes and Peaches; 2nd, Mr. J. Read.

Vegetables.—Gentlemen Gardeners' class for a collection of vegetables, not fewer than eight varieties: Mr. J. Read, gr. to the Earl of Carnarvon, was 1st; and Mr. T. Postings, gr. to Mrs. Wright Bozcott, Rudge Hall, Wolverhampton, 2nd.

There were numbers of honorary exhibits. Mr. H. Eckford, Wem, had a charming collection of Sweet Peas.

Messrs. Hewitt & Co., Solihull Nurseries, Birmingham, had a fine collection of hardy herbaceous blooms, amongst them the very pretty Lathyrus latifolius Turneri. Mr. J. H. White, nurseryman, Worcester, had a fine display of Emily Henderson, Sweet Pea, new bedding Petunia Brilliant, Iris Kæmpferi varieties, Lilium dahuricum Sappho, brilliant in colour, and the lovely Escholtzia tenuifolia. Messrs. Shuttleworth & Co., Bradford, sent a small collection of Orchids. Messrs. Thomson & Co., Sparkhill Nurseries, Birmingham, had a fine group of border Pinks, herbaceous flowers, and a fine collection of Delphiniums. Messrs. Clibran & Sons, nurserymen, Altrincham, arranged a fine display of cut blooms of hardy flowers, including some good Cannas. Mr. Thos. Ware, of Hale Farm Nurseries, Tottenham, sent a very fine display of double and single flowered tuberous Begonias; and Messrs. B. S. Williams & Co., Holloway, contributed a bank of new and rare plants, including some new Dracænas, Cypripediums, the beautiful Odontoglossum vexillarium Cobbianum, Tillandsia Zahnni, Sobralia macrantha lilacina, Bertolonias, &c. Messrs. Birkenhead, The Nurseries, Sale, Manchester, staged a bank of choice Ferns, including the rarely-seen Adiantum palmatum, Davallia tenuifolia Veitchiana, Pteris cretica sempervirens, and Adiantum macrophyllum albo-striatum.

Mr. Joseph Toury, Wolverhampton, had an extensive display of patent rustic garden vases.

Several Certificates were awarded to new Violas, Pansies, and other objects.

The exhibition, acknowledged by all to be a very fine one, was admirably managed by Messrs. W. A. Green, sen. and jun., and the committee.

ROYAL CALEDONIAN HORTICULTURAL.

Edinburgh, July 11.—The summer show of this Society opened under favourable weather on Wednesday last in the Waverley Market, which, upon entering from the gallery, presented a gay and lively appearance, although some of the classes were not competed for strongly. Roses, as might be expected, were the principal feature; and although the season is later than last year, the entries are numerous, and the Roses of good colour and form. In the nurserymen's classes, the prize for the 48 distinct varieties was keenly contested, the premier position being gained by Mr. Hugh Dickson of Belfast. Messrs. D. and W. Croll were also successful exhibitors, taking no fewer than twelve 1st prizes, some of their exhibits being remarkably fine.

The tables of plants did much to relieve the glare of colour, some of these being tastefully arranged, Mr. G. Wood taking the 1st prize for this in the gardeners' class. Messrs. Methven had a fine table of flowering and foliage plants, amongst which were Liliums, Palms, the edging of Caladium agyrites being very effective. Messrs. Laird & Son also arranged a table of Violas, Pyrethrum, and stove and greenhouse plants.

The table of Carnations from Messrs. Laing & Mather was quite a centre of attraction, the variegated Germania, Winter Cheer, Duchess of Fife, and several others being very prominent. Fuchsias, which were arranged along the centres of the tables, were well grown and flowered. Amongst the Ferns, Adiantums were especially good, fine specimens of the A. cuneatum gracillimum being noticed. Large specimens of British Ferns were numerous, the first and second prizes being strongly contested.

Orchids were very thinly represented, the successful competitor for four specimens being Mr. W. Sharp, Freeland, Forgandenny, his plants, though small, being well-flowered, his Epidendrum vitellinum majus and Cattleya Sanderiana being worthy of note; the prize for twelve trusses of Orchids being also secured by the same exhibitor.

The Chrysanthemums from Mr. McMillan attracted considerable notice, and were awarded a Certificate of Merit by the judges.

In the classes for fruit, Grapes took the prominent place, the colouring and size of berries in both Black Hamburgh and Madresfield Court being remarkable. The 1st prize exhibit for the collection of eight dishes comprised two kinds of black Grapes, Peaches, Nectarines, Melon, Figs, Cherries, and Strawberries, and was staged by Mr. Smith, Oxenford Castle, Dalkeith.

Vegetables were anything but numerous, the best collection coming from Mr. W. Hope, Tallabelton House, Perth, all being well shaped, and of good growth.

Tomatos, Cauliflowers, and Cucumbers were also deserving of mention, but were not numerously exhibited.

In the nurserymen's competitive classes, Messrs. Cocker & Sons, Aberdeen, secured the 1st prize for the collection of alpine and herbaceous plants, not fewer than fifty distinct species; Mr. M. Cuthbertson being 2nd. These tables were much admired, as were also the cut flowers of herbaceous plants from the same exhibitors. The Palms and Conifers arranged upon pedestals between the tables did much to relieve the bareness of such a large building. The show, which closed on Thursday, was well patronised, the band of the Black Watch playing selections upon both days.

MARKETS.

COVENT GARDEN, July 14.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. Ed.]

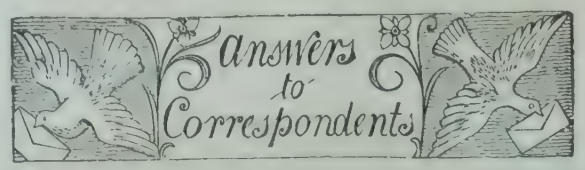
POTATOS.

Potato market not quite so firm. Prices vary from 7*s.* to 11*s.* per cwt. Old Potatos finished.

SEEDS.

LONDON: *July* 11.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report to-day's market devoid alike of business and of interest. Clover seeds are neglected. The new French Trifolium, being good and cheap, attracts rather more attention. For Mustard and Rape seed the inquiry is small. As regards Canary seed, the market gets stronger every day. Very bad accounts continue to come to hand of the new Turkish crop. Hemp seed keeps steady. No change in either Peas or Haricots. The Board of Trade returns give the imports into the United Kingdom of Clover and Grass seeds for the first six months of this year as 196,945 cwt., value £198,336, as against 182,968 cwt., value £156,764, for the corresponding period of 1893.



[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

0, Scotland, N. *Principal Wheat-producing Districts*—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. *Principal Grazing, &c., Districts*—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; *Channel Islands.

*** *Owing to the large increase in our circulation, we are reluctantly under the necessity of going to press some hours earlier. Our contributors, who well know what this implies, will kindly aid us by sending their communications as early in the week as possible. Communications should reach us not later than Wednesday.*

ABIES CONCOLOR: *H. F. E.* The loam is either too retentive of moisture, or the bed is badly drained; the plants are damping-off at the root. Take them all up, and prick off those which have healthy roots into a bed of sandy loam, with some drainage beneath it.

BOOKS: *H. J. C. The Art of Perfumery* (G. W. S. Piesse), published by Longmans & Co., London, will furnish just the kind of information you require.—*J. G. C. My Gardener*, price 2*s.* 9*d.*, by H. W. Ward; published by Eyre & Spottiswoode, East Harding Street, E.C.

CARNATION: *A. R. S.* Yes, a good flower; buff ground, with red stripes.

CORRECTION.—RELATIVE VALUE OF GRAPES, p. 18—By mistake, the maximum value for Cultural Merit was given at 3 instead of 5, as it should have been. *W. W.*

DESIGNS FOR FLOWER BEDS: *A. M. W.* Try Messrs. J Carter & Co, High Holborn, W.C.; and Messrs. H. Cannell & Sons, Swanley Junction.

DOUBLE AND TEN-WEEK STOCKS: *Learner.* Ten-week Stocks, Cheiranthus annuus (Mathiola annua) can be seeded in beds in the open air. They should be planted out or pricked off as soon as they have made four true leaves, not waiting longer, as Stocks of all kinds having but few side-roots, seldom can be got to succeed if they are allowed to stand in the seed-bed till more than this number of leaves form. When flowers appear, retain only those plants which have flowers with 6 or 7 petals, these producing a large percentage of double flowers. The sowings should take place in March and April if seed is to be saved. The plants should occupy a sunny position. If they are grown in pots, a stage against a sunny wall is very suitable, and if it have a roof of glass, oiled canvas or boards for protection in wet weather, it is an advantage. Much depends on careful watering, and no water should be afforded before the soil in the pots has become pretty dry. At first a fine rose may be used, and when a crust has formed the spout of the watering-can only. In dull or wet weather scarcely any water may be afforded. The enemies to guard against are a small white caterpillar and the Turnip-fly or flea (Haltica nemorum), which devours the young leaves; and against which only clean water may be used by means of a syringe. Biennial species of Stocks are managed as regards seed saving in the same manner. Seed may be sown in May or June, the latter month is perhaps the better for raising plants for spring-flowering, as when sown earlier a weak bloom often comes in late autumn or early winter, at a period therefore not favourable for seeding. When of the desired size, the seedlings must be pricked out in a shallow cold frame, and planted in the open in July, at 9 inches to 1 foot apart. After planting, several good waterings will be required, and the soil kept stirred on the surface. Planting in pots takes place in September and October, throwing those away which show signs of being quite single.

EMIGRATION: *Perplexed.* We know nothing personally of the enterprise you mention, but we are disposed to place confidence in it. Apply to the Emigration Office, Broadway, Westminster. By no means part with your capital, wherever you go, till you have made yourself reasonably sure of your prospects.

FRUIT OF NECTARINES CRACKING: *M. F.* Probably a fungus—Fusicladium dendriticum—which feeds on the skin, and kills it; the pulp continuing to grow, splits the skin.

GRAPES: *An Anxious One.* The berries have the "spot," specimens of which we have very often brought under our notice this year. See replies this week to other senders. Shanking is also carrying off the berries of your bunches wholesale. That is usually due to a bad state of the roots overcropping, or a severe check to the Vines inflicted by the sudden removal of a large quantity of foliage and shoots. You should examine the border late in September, and if the soil be in a bad state from some cause or other, make a new border, well furnished with the means of drainage.

GRAPES, DISEASED: *H. F., G. C., and many others.* Spot, due to a fungus (Gloeosporium læticolor). See p. 44.

NAMES OF PLANTS: *C. W.* Platystemon californicus, annual, nat. ord. Papaveraceæ.—*Cynosurus.* 1, Festuca pratensis; 2, Lolium perenne; 3, Aira cæspitosa; 4, Poa pratensis; 5, Bromus giganteus; 6, Arrhenatherum avenaceum.—*M. L.* Some of the labels were detached. 1, Neottia nidus-avis, brown; 3, Orchis conopsea, small; 4, Orchis maculata; 5, Orchis maculata; 7, Geranium pratense; 8, Lychnis flos-cuculi; Listera ovata, green; Habenaria bifolia, white. All except No. 7 and 8 are British Orchids, not uncommon in some places. There are several other British Orchids. —*H. Henkel.* Anguloa uniflora.—*Lucy Burton.* Rhamnus catharticus, Buckthorn; berries purgative.—*T. C. H.* 1, Pyrus Aria; 2, Cratægus tanacetifolia.—*G. H. S.* Lactuca Plumieri.—*G. M.* Clitoria dentata.—*J. L. McK.* Eucomis punctata and Liriodendron tulipiferum.—*W. R.* 1, Sempervivum montanum; 2, Funckia Sieboldi variegata.—*C. G.* 1, Polygonum aviculare; 2, Ranunculus lingua; 3, Senecio silvaticus; 4, Hieracium Pilosella; 5, Crepis biennis; 6, Chrysanthemum segetum; 7, Heracleum Sphondylium.—*W. D. Mitton.* Silene nutans.—*Sir C. W. S.* Next week.

ODONTOGLOSSUM ALEXANDRÆ: *A. H. H.* When the new pseudobulb is about fully grown, afford rather less warmth, and water, and more air.

PHALÆNOPSIS SPOTTING: *W. Johnson.* From the information you supply, we should certainly say that the cause of damage to the leaves of your Phalænopsis is a too high temperature, especially if the heat you mention (a maximum of 100° Fah.) is in any way approached at night, at which time 65° would be ample if the temperature outside admits of its being kept down to that. Contributory circumstances may be the sun's rays through defective or bad glass, and the fumes of the white-lead you speak of as being used as shading if inside the house. We should never recommend paint or white-lead for such a purpose. Canvas blinds are the only really good shading, unless the continental lath shading be used. Where a wash is used, "Summer Cloud," or skim milk and whiting are the best, as they are inodorous.

POTATOS: *A. J. S.* The disease is that known as dry rot, concerning which little is known beyond what is described and illustrated in our columns, December 20, 1884, fig. 135, and January 3, 1885.

TOMATO: *J. D.* Affected by a fungus like that which affects the Potato. Burn the plant immediately, and syringe the others with weak Bordeaux Mixture, taking care not to use it if the fruits are ripening.

TULIPS: *J. R. H.* Yes, bulb-mite. Take off, and burn the old scales. The bulbs seem sound. Try steeping in Quassia-water.

VEGETABLE TERATOLOGY: *Ina.* Out of print long since; it is now very scarce. The German edition, published a few years since, may be had from Williams & Norgate, Henrietta Street, Covent Garden.

ESTATE SALES.
The Best County Medium for Advertising Sales of Estates is
THE "WORCESTER HERALD,"
ESTABLISHED 1794,
The Leading County Paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to forward for reference and distribution plans and particulars of Estates, Catalogues of Machinery, Furniture, Books, and other property advertised in the columns of the "HERALD."
Sales of Stock and Agricultural Effects.
The "WORCESTER HERALD" is the most effective organ for giving publicity to announcements of this class. It is the leading Agricultural Paper in the County, and Circulates most extensively among Agriculturists in and around Worcestershire.
Farms to Let.
Land Agents, Estate Managers, and all having Farms to Let, would do well to advertise in the "WORCESTER HERALD," the leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large circulation. Moderate charge.
Situations Vacant and Wanted.
For producing results the "WORCESTER HERALD" is recognised as a specially good medium. Cheap Rates.
Apply for Terms.
SPECIMEN FREE. Price 2d.

GARDENING APPOINTMENTS.

MR. ALFRD LODGE, formerly Head Gardener at Brougham Hall, Penrith, as Head Gardener to Lord IVEAGH, Elvedon Hall, Thetford, Suffolk.
MR. CHARLES JAMES, as Gardener to C. RODGERS, Esq., The Rookery House, Watford, Herts.

TO NURSERYMAN.—A Gentleman, with a moderate capital, is desirous of joining a thoroughly practical Gardener, with good connection, with a view to carrying on business as Nurserymen. Midland Counties preferred.—Reply, with full particulars, to RICHARDSON AND GORING THOMAS, Solicitors, 76, Finsbury Pavement, London, E.C.

TO FLORISTS and NURSERYMEN (a few miles from London), about giving up business.—Wanted, by a young man of some experience, a situation with a view to joining in PARTNERSHIP, or taking over a small business later on.—"I 229," Shelley's, 38, Gracechurch Street, E.C.

WANTED, to MANAGE FOLIAGE NURSERY. Must be a clever Grower of all varieties. Good wages and comfortable house. Excellent references indispensable.—Apply, Tuesday morning, 11 o'clock, 28, Crawford Street, W.

WANTED, an UNDER GARDENER, in Berkshire, Third, where three and a boy are kept. Bothy, with milk and vegetables.—Write, stating age, wages required, and particulars as to last place, to G. B., Esq., Porter, Stationer, Sussex Place, Onslow Square.

WANTED, a HEAD WORKING GARDENER, in Devonshire, in a garden where six men are kept.—Must be thoroughly efficient both in Fruit and Flowers, and have unexceptionable references. Man and wife without encumbrance preferred, or not exceeding one child. Age between 35 and 45.—Address, stating wages, age, and references, to M. L., Roberts' Library, 2, Lower Grosvenor Place, London, S.W.

WANTED.—In a Gentleman's Garden, an active man as WORKING GARDENER, good kitchen gardener indispensable; not much glass.—Address, S., Mr. D. Cooper, Stationer, Huntingdon.

WANTED, a FOREMAN and PROPAGATOR, for Glass Nursery and Herbaceous Department, one who thoroughly understands the Growing of Soft-wooded Plants for Cut Flowers and Market, Roses, Clematis, &c None but thoroughly competent men need apply.—PENNELL AND SONS, Nurseries, Lincoln.

Roses.
WANTED, a young MAN, to take Charge of the Out-door Roses.—Apply, stating experience and wages required, to CHARLES TURNER, The Royal Nurseries, Slough.

WANTED, TWO young MEN, under Foreman, well up in Budding and Grafting.—Permanent situation for suitable men.—State age, references, and wages required, to EDWIN MURRELL, Portland Nurseries, Shrewsbury.

WANTED, for a few weeks, good ROSE-BUDDERS.—Only those used to the work need apply. Good wages.—S. G. RUMSEY, Rose Grower, Wrotham.

WANTED, an active young MAN, used to Potting, Watering, and Tying plants for Market. Wages £1 per week. Apply personally, if possible, Mr. ORPWOOD, Cowley Mill Road, Uxbridge.

WANTED, a YOUTH as IMPROVER, not under 17. Fourth in bothy.—Particulars to C. HERRIN, Dropmore, Maidenhead.

WANTED, a young MAN, well up in Growing and Bunching Flowers. Good Salesman. State wages.—M. B., 41, Wellington Street, Strand, W.C.

To Seed Trade.
WANTED, in a large Seed Establishment, a thorough competent BOOK-KEEPER, age about 30. Also an INVOICE CLERK, about 20. Both must write a clear hand and be quick at accounts. State full particulars, where employed, and how long, with wages required.—Address, SEEDS, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANT PLACES.

TO GARDENERS AND OTHERS SEEKING SITUATIONS.

The pressure upon our space at this season of the year is so great, we are compelled to state that advertisements received after 6 P.M. *on Wednesday will, in all probability, be held over to the next week.*

Advertisers are cautioned against having letters addressed to initials at Post-offices, as all Letters so addressed are opened by the authorities and returned to the sender.

Gardeners, Foresters, Land Stewards, &c.
JOHN DOWNIE, 144, Princes Street, EDINBURGH, can confidently recommend first-class Men as above, of excellent character and ability. Highest recommendations. Telegraphic address, "DOWNIE, EDINBURGH."

Gardeners, Farm-Bailiffs, Foresters, &c.
DICKSONS, Royal Nurseries, Chester, are always in a position to RECOMMEND MEN of the *highest* respectability, and *thoroughly practical* at their business. All particulars on application.
Telegraphic and Postal Address—"DICKSONS, CHESTER."

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

F. SANDER AND CO. can recommend several highly qualified and energetic HEAD and UNDER GARDENERS, of excellent character, and proved ability; men thoroughly fitted for all the various duties of their profession. For all particulars, please apply to—
F. SANDER AND CO., St. Albans.

GARDENER (HEAD).—Age 38; thoroughly experienced and proficient in the management of large establishment; life experience, eight-and-half years' excellent reference as above.—W. KING, The Chepping, Tetbury, Glos.

GARDENER (HEAD).—Age 31; fourteen years' good practical experience in the Cultivation of Pines, Vines, Peaches, Nectarines, Stove and Greenhouse Plants, Flower and Kitchen Gardens. Five years Foreman in last situation in the gardens of the Right Hon. Lord Llangattock, of the Hendre, Monmouth. Can be well recommended.—W. WELLS, Kirklington, Bedale, Yorkshire.

GARDENER (HEAD).—Age 31, married. Good practical experience in all branches; Land and Stock if required. Good characters. Disengaged when suited.
J. KEMP, Shalimar, Ewell, Surrey.

GARDENER (HEAD), where two or more are kept.—Age 35, married, has two children 9 and 5; twenty years' experience. Ten years in present place as Head Gardener. Successful exhibitor in all classes of Fruit and Flowers. Abstainer. Experience in some of the leading gardens in England.—F. EXELL, Head Gardener, Miserden Park, Cirencester.

GARDENER (HEAD); age 28, married.—The Right Hon. EARL OF BUCHAN will be pleased to recommend his late Gardener. Thoroughly competent in all branches.—H., Waldron House, Garratt Lane, Tooting, S.W.

GARDENER (HEAD).—THOMAS H. MAWSON, Garden Architect, Windermere, can with every confidence recommend a Gardener as above. He is most highly recommended by present and former employers. Experienced in every branch, and capable of conducting a large staff of men for ground-work, in formation of new grounds, if required.—Address, in first instance, to Advertiser.

GARDENER (HEAD WORKING).—Scotch, age 42; married; no family; thorough life experience, first-class testimonials. J. LAWIE, gardener to Sir Massey Lopes, Bart., is open to re-engage with anyone in want of a trustworthy all-round Gardener.—The Gardens, Maristow, Roborough, Devon.

GARDENER (HEAD WORKING); where one or more under are kept.—Age 44, married, one child, grown up; skilful Fruit, Flower, and Vegetable Grower. Four and a half years' personal character. Understands Stock.—WILLIS, Bletchley Road, Bletchley, Bucks.

GARDENER (HEAD WORKING).—Age 35, married. Thoroughly experienced in all branches of Gardening. Can be highly recommended; excellent character.—GARDENER, Manor Cottage, Aspenden, near Buntingford, Herts.

GARDENER (HEAD WORKING).—Age 34, one child; twenty years' good practical experience in all branches, with excellent character.—M. FIELD, Chestnut Grove, Staines.

GARDENER (HEAD WORKING).—Age 49, married, no family. Efficient and trustworthy; life experience; excellent references.—J. BREWER, 347, Crystal Palace Road, East Dulwich, S.E.

GARDENER (HEAD WORKING).—Married; Thorough, practical, and energetic; four-and-a-half years' good character.—J. DIXON, Cedar Cottage, Old Windsor, Berks.

GARDENER (HEAD WORKING).—Age 32, married, without family; thoroughly experienced in Fruit, Flowers, Vegetables; also Table Decoration. Wife Dairy, if required. Highest references as to character and ability.—CLARK, Kisber Cottage, South Norwood.

GARDENER (HEAD WORKING).—Age 35, married; thoroughly practical in Forcing Fruit, Flowers, and Vegetables, Kitchen and Flower Gardens, Chrysanthemums, &c. Excellent references.—JOHN DOBSON, Westfield Road, Lymington.

GARDENER (HEAD WORKING, or good SINGLE-HANDED).—Age 42, four in family. Life experience; understands Land and Stock; four years' good character.—R. LEPPARD, 57, Sanderstead Rd., South Croydon.

GARDENER (HEAD WORKING, where two or more are kept).—Thirteen years' practical experience in all branches. Abstainer.—A. B., Mr. Fleming, Woking Village.

GARDENER (HEAD WORKING).—Age 32, married; excellent character from present and previous employers. Life-experience. Disengaged when suited.—A. B., 12, Woburn Cottages, Chapel Park, Addlestone.

GARDENER (HEAD WORKING).—Scotch; age 37, married, no family. Thoroughly experienced in all branches of the profession. Wife good Laundress, if required. Good character.—A. CAMPBELL, Avondel, Hollington Park, St. Leonards-on-Sea.

GARDENER (HEAD WORKING), where three or more are kept.—Age 34, married, no family; sixteen years' experience in good establishments. Early and Late Forcing, Flower and Kitchen Garden. Three years' good character.—WILLIAM HEATH, 513, King's Road, Chelsea.

GARDENER (HEAD WORKING).—Age 42, married; understands Vines, Peaches, Melons, Tomatos, and all branches of Gardening, six years' references from last place.—P., 99, Hamilton Road, West Norwood, S.E.

GARDENER (HEAD, or SINGLE-HANDED).—J. KINGAN, Stonefield, Lincoln, can recommend W. Moore to any Lady or Gentleman in want of such.

GARDENER (HEAD, or good SINGLE-HANDED).—Age 34, married; energetic and trustworthy. Nearly seven years as Head in last place. Experienced in all branches.—E. W., Mr. Tull, Chalvey Road Nursery, Slough, Bucks.

GARDENER (HEAD, or good SINGLE-HANDED).—Life-experience in large establishments; Orchids, Fruit, Stove, Greenhouse, &c., Kitchen and Flower Garden.—G. MARTIN, Lye Green, Withyham, Sussex.

GARDENER (SINGLE-HANDED, or otherwise).—Age 45, married, no children; understands Melons, Cucumbers, Flowers, and willing to be useful. Nine years' good character.—GARDENER, Margery, Kingswood, Reigate.

GARDENER, good SINGLE-HANDED, or where two are kept.—Age 34, married, two children; eight years' good character, leaving through death of employer.—T. STRAND, 5, Addison Road, Kensington, W.

GARDENER (Head Working); age 43, married.—A Gentleman would be pleased to highly recommend his late Gardener as above. Of the highest respectability, and a thorough practical man. Good Manager, and has been in his service six and a half years.—W. M., 2, Osborn Cottages, Turner's Hill, Cheshunt, Herts.

GARDENER (Single-handed).—No objection to Pony and Trap; age 26; married, no family. Good character, abstainer.—H. SONS, Walbrook House, Blenheim Road, Deal, Kent.

GARDENER (Single-handed, or otherwise).—Age 30, married, no encumbrance; life experience in all branches.—A. HAMMOND, 2, Junction Road, Potter's Bar, Middlesex.

GARDENER (Single-handed, or JOURNEYMAN), in Flower or Kitchen Garden.—Mr. James Rogers, Gardener to Earl Temple, Wotton, near Aylesbury, wishes to strongly recommend a steady, hard-working man as above; age 30; has been here over nine years, and leaving through no fault.

GARDENER (good Single-handed).—Age 23. All-round experience of eight years; good character from previous situations. Abstainer.—A. KIRBY, Lord Street, Hoddesdon, Herts.

GARDENER (good Single-handed, or Second).—Age 23; thoroughly understands Vines, Cucumbers, Tomatos, Chrysanthemums, Flower and Kitchen Gardens. Good references.—BAGLIN, Kenn Gatton, Somerset.

GARDENER (Single-handed, or Second of two).—Age 26, single; twelve years' experience in all branches, 12 months' good character, 3 years previous.—H. GARRETT, 19, Coneyhill, Foxgrove Road, Beckenham, Kent.

GARDENER (one under, or good Single-handed).—Age 35, married, no family; thoroughly experienced in Forcing Fruit, Plants, Flowers, &c., also Flower and Kitchen Garden. Good references.—KELLAWAY, The Gardens, 40, Dartmouth Road, Forest Hill.

GARDENER (Single-handed, or SECOND).—Age 24; eight years' experience. Left through no fault. Twelve months' good character. Abstainer.—C. EDWARDS, Western Green, Thames Ditton, Surrey.

GARDENER, Inside and Out, or Kitchen Garden and Pleasure-ground Man.—Age 25; nine years' experience. Can be well recommended.—F. BERIMAN, Slindon, near Arundel, Sussex.

GARDENER, where two or three are kept.—Age 26, single; eleven years' experience in first-class places.—T. W. O., Manor House Gardens, Effingham, Leatherhead, Surrey.

GARDENER.—Age 23; eight years' experience with Vines, Peaches, Stove and Greenhouse Plants. Abstainer.—WM. GOODMAN, 11, Clarendon Crescent, Leamington.

GARDENER (Second), where four or five are kept.—J. Treadwell can with confidence recommend a young man that has been with him four years as above. Please state particulars.—TIMARU, Chislehurst, Kent.

GARDENER (Second).—Age 24, single. Ten years' practical experience in all branches; well recommended by former employers.—G. SUCH, 41, Lower Addiscombe Road, Croydon.

GARDENER (Second), in a good establishment Inside or Inside and Out.—Age 24; four and a half years' good character.—C. DUNN, Tilgate Forest Row, Handcross, near Crawley, Sussex.

GARDENER (Second), where three or four are kept.—Five years' good character. Bothy preferred.—A. THORNE, The Bothy, The Beeches, Oatlands Park, Surrey.

GARDENER (Second, or Under), Inside and Out.—Age 23; throughly accustomed to duties.—For full particulars, A. SPEAKMAN, 10, Percy Road, North Finchley, N.

GARDENER (Under).—Age 20; two years' good character.—F. HALL, Chilworth, near Guildford, Surrey.

GARDENER (Under).—Age 20; has been apprenticed two years with indenture. Good references.—WALTER CASTLE, Holbeach Drove, Wisbech.

GARDENER (Under).—Situation wanted by a young Man, age 21, as above. Inside or Out. Good character.—A. BOOKER, Mr. W. Iles, The Gardens, Bovingdon House, Hemel Hempstead, Herts.

GARDENER (Under), Inside and Out.—Age 22, single. Three years' good character from present employer. Bothy preferred.—W. W., The Gardens, Chacombe Priory, Chacombe, near Banbury.

GARDENER (Under).—Age 20; two years' good character from present place.—W. AMBROSE, Th Grange, Elstree, Herts.

GARDENER (Under).—Age 28; to work Inside in Gentleman's Garden. Has good knowledge of above.—Apply, stating wages, to H. I., Drove Park Cottages, Singleton, Chichester, Sussex.

Corn, Seed, Bulbs, Plants, &c.

SHOPMAN, CLERK, or BRANCH MANAGER. Wife could assist if required. No family. Both experienced; highest references.—DISENGAGED, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

A GREAT BLESSING TO HUMANITY is without doubt a medicine composed of ingredients that, whilst it eradicates the germs of disease strengthens the system. HOLLOWAY'S PILLS act in this manner, and in general debility, mental depression, and nervous irritability there is no remedy which operates so beneficially. They purify the blood, give tone to the stomach, and thoroughly regenerate the system. They are mild in operation, although most powerful in removing disease. Delicate females and young children can take them with safety and benefit. It would be difficult to enumerate all the advantages to be derived by taking these wonderful pills. No household should be without them, for there is no complaint which they cannot cure or relieve.

MERRYWEATHER'S

CHIEF SPECIALTIES IN HOSE:

1.—NON-KINKABLE "RED-GREY" HOSE.
2.—"SPHINCTER GRIP" ARMOURED HOSE.
3.—HIGH-CLASS RED RUBBER HOSE.

Made on the same lines as the Hose used with their celebrated Fire Engines.

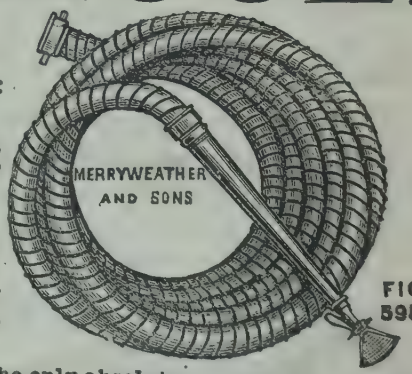

FIG 595.

See that Merryweather's name is embossed on every length, this is the only absolute guarantee of quality

Merryweathers' introduced Sphincter Grip Hose into this country in the year 1887; they are the Original Makers, and they still sell a Hose which is far superior to every other in the Market.

Beware of Wire-armoured Hose which is counterfeit, and inferior Foreign make.

Users of Hose are cautioned against inferior qualities sold by dealers who have copied our method of advertising, but have not adhered to our high quality. Orders executed the same day as received.

Merryweather's High-class Garden Pumps and Watering Appliances to be seen in action at

63, LONG ACRE, LONDON, W.C.; or write, Greenwich Road, S.E.

Friday Next.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, July 27, at half-past 12 o'Clock, an importation of STENIA PALLIDA, a charming Orchid with evergreen foliage and large golden yellow flowers, the lip spotted with red, very rare, and difficult to import. The plants offered are fresh as when collected.

Also healthy fresh imported plants of the pretty ONCIDIUM INDIFOLIUM, IONOPSIS PANICULATA, EPIDENDRUM STENOPETALUM, with rose Barkeria-like flowers. TETRANICRA, new species (?) of curious growth and elegant flower; ASPASIA VARIEGATA, various EPIDENDRUMS, BRASSAVOLAS, and SCHOMBURGKIAS, from Nicaragua; and six established plants of the pretty scarlet LÆLIA MONOPHYLLA, in flower or bud.

On view morning of Sale, and Catalogues had.

TO DUTCH BULB GROWERS AND ENGLISH BUYERS.

MESSRS. POPE AND SONS wish to call the attention of the above to their SALES of BULBS, which will be held every TUESDAY and THURSDAY, commencing THURSDAY, August 23.

FLORISTS, and others requiring large quantities of Bulbs, cannot do better than give these Sales a trial, as we are sure (from a life-long experience of the Trade) that the Bulbs usually sold are good, sound, and true to name, and at Prices that cannot be touched in the Trade.

To DUTCH BULB GROWERS.—We shall be open to receive Consignments of good sound Bulbs, true to name, for Sale by Auction, and shall always do the best possible for all Senders, and send Account of Sales and Cheques immediately after the Sale.

POPE AND SONS, Horticultural Auctioneers, 6, Phillips Street (adjoining the Market Hall), Birmingham.

WANTED, to RENT a small NURSERY, with or without House attached. West or North-west district preferred. No objection to take to Stock, &c.—Address, with full particulars, as to size, rent, lease, &c., to M., 23, Queen's Terrace, Finchley Road, N.W.

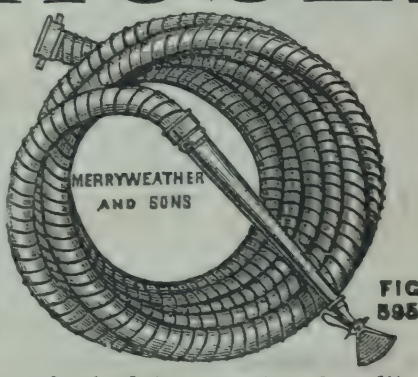
GARDEN HOSE.

MERRYWEATHER'S
CHIEF SPECIALTIES IN HOSE:
1.—NON-KINKABLE "RED-GREY" HOSE.
2.—"SPHINCTER GRIP" ARMOURED HOSE.
3.—HIGH-CLASS RED RUBBER HOSE.
Made on the same lines as the Hose used with their celebrated Fire Engines.



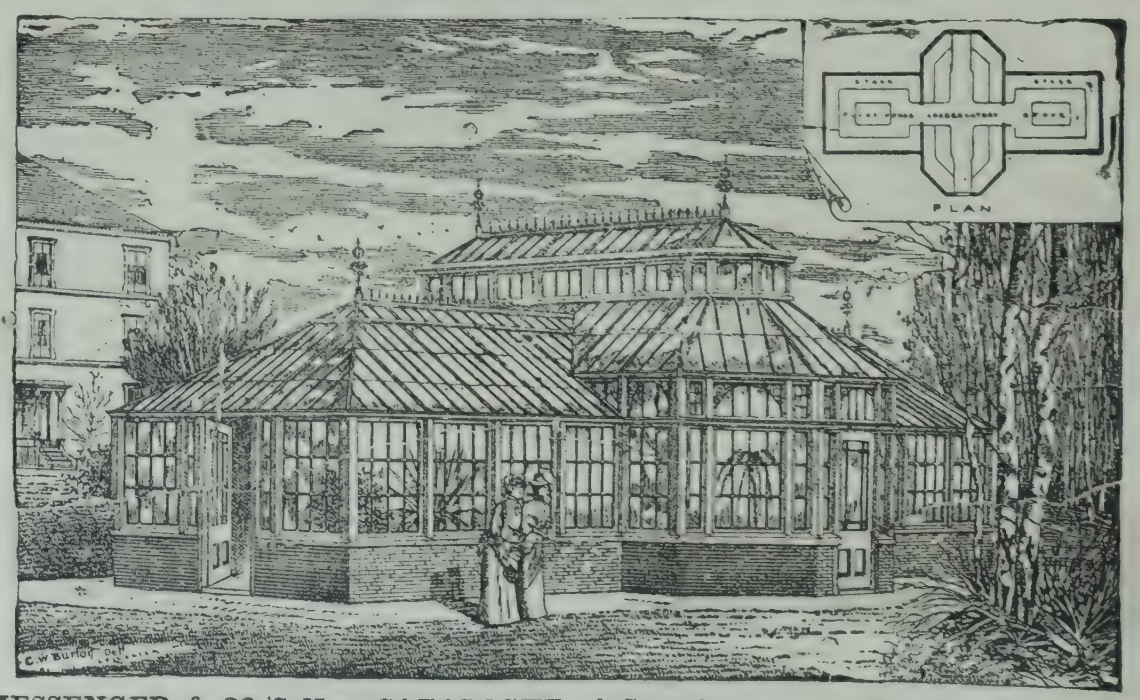


FIG 595.

See that Merryweather's name is embossed on every length, this is the only absolute guarantee of quality
Merryweathers' introduced Sphincter Grip Hose into this country in the year 1837; they are the Original Makers, and they still sell a Hose which is far superior to every other in the Market.
Beware of Wire-armoured Hose which is counterfeit, and inferior Foreign make.
Users of Hose are cautioned against inferior qualities sold by dealers who have copied our method of advertising, but have not adhered to our high quality. Orders executed the same day as received.
Merryweather's High-class Garden Pumps and Watering Appliances to be seen in action at
63, LONG ACRE, LONDON, W.C.; or write, Greenwich Road, S.E.

MESSENGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus,
Will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses. Illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kinds of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. **Price, 2s. post-free.**
A large number of the illustrations are taken from greenhouses erected by us in various parts of the country; an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made, and gentlemen waited on in any part of the country. Plans and Estimates free on application.

SATURDAY, JULY 21, 1894.

ROSES.

THE great Rose event of the year has come and gone. It has falsified the criticisms of some, shown how unstable were the forebodings of others, and has fully justified the decisions of the committee of the Society in fixing the date; neither attending to the suggestions of those who would have made it a week later, or of those who would have thrown it back to the previous Saturday. It is true that the extreme north and the extreme south were but feebly represented, but from all other parts of the country exhibits were sent in large numbers, and in some of the classes an unusually large number were contributed, forming a very striking contrast to the exhibition of last year, when a very large percentage of the prizes was not awarded, as in only some half-dozen cases were they withheld this year. We cannot wonder that the extreme south should have been but feebly represented, when we recollect that a month had passed since the date at which the Isle of Wight shows had been originally fixed, though here it is worthy to note that the Rev. G. Jeans, who won the gold medal on June 13 for Isle of Wight Roses, was able to take a 1st prize at this exhibition also. But the Exeter and Torquay contingent made no sign; and in the same way, although some of the northern men did put in an appearance, their time had evidently not come—some had been hampered by the severe frosts of May 20, and others who had not suffered from that, did suffer from the very high cold north-easterly wind which followed very close upon it. I do not think that the general character of the flowers exhibited was up to the average; there were but few boxes over which one would wish to linger with the conviction that it was one of the finest boxes of Roses ever exhibited. The same may be said of individual blooms; there were very few of such exceptional merit as we have sometimes seen, while I do not think that there was any one Rose which stood out prominently wherever exhibited, as we have sometimes seen. We have had years which were Charles Lefebvre years, or something of that kind, but I cannot note any one Rose which was particularly good this season; of course, I do not mean to say that there were not some very fine blooms, such as the Marie Baumann which obtained a Silver Medal for Mr. B. Cant, or the fine Bride which won the same distinction for Mr. Geo. Prince.

I think one of the most remarkable features of the show was the manner in which East Anglia carried off the chief honours: out of some fifty classes, the growers, professional and amateur, carried off twenty-two 1st prizes and most of the special prizes given; this is a very remarkable record, showing, I think, conclusively, that notwithstanding the dry character of the climate, and the manner in which it is

sometimes swept by winds from the German Ocean, it is evidently a part of our island which Roses love. It is curious, too, to observe, that while the 1st prizes in the hybrid perpetual section, or rather any variety section, go to nurserymen residing in the eastern counties, the 1st prizes for the amateur section go elsewhere, showing, I think, what I know to be the fact, that perhaps with one exception there are no very large amateur growers residing there. In the Tea and Noisette section the 1st prize for professionals is carried off by growers in other parts of the country, while in the amateur divisions East Anglians have it all to themselves. Mr. Berners was especially successful, carrying off the Tea Challenge trophy, the Boscawen Memorial Cup, and the Turner Memorial Cup; while Mr. Orpen carried off the Harkness Challenge Cup and the piece of plate presented by Rev. F. R. Burnside. East Anglia may thus be well proud of its achievements, and has shown a record which it will be difficult to beat.

A great deal of interest always attaches to the Challenge trophies; both of these have gone to different quarters to what they did last season. Mr. Frank Cant, after a severe contest, was adjudged the professional one; and Mr. S. P. Budd of Bath has at last obtained the cherished object of his ambition, which has for the past four years been in the hands of Mr. E. B. Lindsell of Hitchin. The Tea trophy, as I have already said, was gained by the Rev. Hugh A. Berners, on whom fortune has unquestionably smiled this year. The Silver Medals presented for the best H. P. or H. T., and the best Tea or Noisette, were gained by Mr. B. R. Cant for a grand bloom of Marie Baumann, of great depth and brilliancy of colour; and by Mr. George Prince, for a lovely bloom of great purity and depth of The Bride. In the amateur division, Mr. S. P. Budd gained the Medal for a very beautiful bloom of a Rose quite unknown to me, and, indeed, to all with whom I have had an opportunity of speaking on the subject—it is called Margaret Boudet; it was raised by Guillot in 1888, but this is the first time, so far as I know, that it has been shown, so that I fear there must be something delicate in its constitution. The Medal for the best Tea was awarded to the Rev. A. Foster Melliar for a good bloom of Souvenir d'Elise, but which was not at all comparable to the grand bloom of Madame Cusin, which gained him the same distinction last year. There was a pretty good display of new Roses; but what a change has come over us entirely in this respect! Formerly we looked across the Channel for Roses to exhibit in this class; but of the twelve with which Mr. F. Cant won the 1st prize, the following were of home origin:—Duke of Fife (a sport), Marchioness of Londonderry (I cannot say that I admire the colour of this flower, there is an ashen-grey tint about it—at least, this year it is not pleasant), Margaret Dickson, Spenser, Violet Queen, Medea (American), Charles Gater, and Mrs. Harkness (a sport); while in the amateurs' division for six, only one of them, Caroline Testout, was of foreign raising. So far as I could see, there was nothing remarkable in the French ones exhibited. It was with feelings of grim satisfaction that I observed what a miserable exhibition the Hybrid Teas made of themselves. Although there were thirteen entries, nine of which were, I believe, set up, there was only one that obtained a prize, and that was a 2nd one; and I think no one would say that the exhibition would have been much the worse had there been no such class. The truth is, that this division is not wanted, and the sooner that all the Roses now included amongst Hybrid Perpetuals, Hybrid Teas, and Bourbons are merged into one class the better will it be for exhibitors and the public. Several new seedling Roses were exhibited in competition for the Gold Medal, beside Marchioness of Downshire, with which Messrs. Alex. Dickson & Sons, Newtownards, gained the Gold Medal (a Rose of very pleasing shade of pink), the same firm also exhibited Mrs. Edward Mawley; Messrs. William Paul & Son, their pretty Rose Clio, H.P.; Messrs. Cooling & Sons, Bath, a pleasing light flower somewhat in the style of Spenser; and Mr. Alex. Hill Gray a pretty button-hole Rose, Allister Stella Gray, a flower somewhat of the style of William A. Richardson.

Of the garden Roses exhibited, it is hardly possible to say too much, and the ever-increasing interest of the public in them was shown by the crowds which surrounded them during the day. I do not think that such a box of thirty-six as that contributed by Messrs. Paul & Son, of Cheshunt, has ever been set up before; it contained beautiful groups of W. A. Richardson, of the intensest orange tint (would that we could get it always to remain in this condition instead of going off into white), L'Idéal, with its indescribable tints of colour; Rosa Mundi, Rugosa, Perle d'Or, Camoens, &c. Messrs. Cooling, of Bath, whose stand obtained the 2nd prize, had also some beautiful flowers. Amongst amateurs, Mr. Orpen clearly carried off the chief honours with a very beautiful stand, containing the following flowers:—Clare Jacquier, Ma Capucine, Gloire de Polyantha, Crimson Rambler, Maiden's Blush, Ma Paquerette, L'Idéal, Rose d'Or, W. A. Richardson, Gustave Regis, York and Lancaster, Marie Pavie, Madame Cecile Brunner, Anna Marie de Montravel, Crimson China, Mignonette, Bardon Job, and Perled'Or. Mr. Cuthell, of Dorking, had a very beautiful box of single Roses, conspicuous amongst which was the large white Macrantha, beautifully pure and clear, and with its yellow stamens making a conspicuous object. Roses arranged for decorative purposes in space 5 feet by 3 were also much admired; the 1st prize going to Mr. Cuthell, occupying the same position as he did at the Windsor show, Mr. Mount being 2nd, as he was also at that show.

The arrangement of the exhibition was somewhat different from that on former occasions, and was admitted on all hands to be a great improvement on that of previous years; the exhibition occupied the two transepts, instead of being, as last year, confined to one side in itself—a great improvement, as there was no congestion, and this improvement was still further increased by the show being broken up into sections. This took away the formality of the two long rows of boxes, while at the same time it afforded the public a freer access to the tables, so that it was possible to view the flowers with some degree of comfort. The officials of the Crystal Palace did their best to make all run smoothly, and when it is recollected that barely an hour is given to the nearly eighty judges for the performance of their task, and that these judges have to be collected, assigned their positions, and send in their awards in that time, it is I think very creditable that so large an exhibition containing sixty classes should have gone off without a hitch. The exhibition may be said therefore to have been on the whole a successful one, and may well inspire feelings of confidence amongst the members of the National Rose Society as to its onward progress. *Wild Rose.*

New or Noteworthy Plants.

BRACHYSTELMA CAFFRUM, *N. E. Br.*

Although containing a considerable number of species, it is very seldom that a Brachystelma is to be met with under cultivation, and it is a pleasure to record that a very pretty little species of this Asclepiadaceous genus is now flowering at Kew. It is a native of the neighbourhood of King William's Town, South Africa, and was sent to Kew by M. Bolus in 1892. It has recently been described in the *Verhandlungen des Botanischen Vereins der Provinz Brandenburg*, vol. 35 (1894), p. 54, under the name of Tapeinostelma caffrum, Schlecter, but has no claim to a new generic title, as in all details of structure it is identical with Micraster of Harvey. The latter name, however, has been merged in Brachystelma by Bentham in the *Genera Plantarum*, and rightly so in my opinion, as the corona and habit are as in typical Brachystelma, the only distinction being that the corolla has no tube. There is, however, great variability in this genus—as in many other Asclepiadaceous genera—in the development of the corolla-tube; some species have a tubular corolla like a Campanula, between which and a broad saucer-shaped or rotate corolla there are several gradations, and the whole evidently form one very natural and easily-recognised genus. Whilst only a few distinct forms are known to the botanist, it seems easy to group them into distinct genera, but as more and more become known it is often found that the supposed distinctions break down at every point, and this is especially true among Asclepiads, in which order genera have been inordinately multiplied.

Brachystelma caffrum has a tuberous rootstock, slender scaberulous stems, 3 to 5 inches long, spreading on the ground and bearing several pairs of small leaves, which are 2 to 8 lines long, including the very short petiole, 1 to 4½ lines broad; they are mostly ovate-acute, the uppermost sometimes lanceolate-ovate, and the lowest orbicular-ovate, rather thick, glabrous, with the margins and midrib beneath scaberulous, or sometimes sparsely scaberulous beneath. The flowers are lateral between the bases of the leaves, solitary or rarely two from the same node. The pedicels are ½ to 1½ inch long, erect, and scaberulous. The sepals are 1 line long, lanceolate acute, sparsely scaberulous. The corolla is rotate, 5 to 6 lines in diameter, fleshy, and of a bright clear yellow, the lobes are 2 to 2¼ lines long, 1½ to 1¾ line broad, ovate acute, flat, glabrous with minutely ciliolate margins. Corona yellow, formed of a thick fleshy truncate ring ¾ line high, with 5 linear, obtuse, inflexed lobes, incumbent on the backs of the anthers and not produced beyond them.

The flowers stand up well above the trailing stems, and although not large are cheerful and attractive—so long as the nose is kept away from them, for their odour is by no means agreeable. *N. E. Brown.*

Orchid Notes and Gleanings.

FLOWERING OF VANDA TERES.

For over five-and-twenty years we have flowered successfully and abundantly this very pretty Orchid, which has the reputation, as a Scotchman would put it, as being rather "doure" to flower sometimes. We have just now a few plants which show collectively over a score of their lovely inflorescences of mauve, terra-cotta, orange, &c. Some of these trusses have on each three or four individual flowers.

I often thought I should like to send you a description of how we manage to grow and flower this plant; or, perhaps, I should be safe to say, how the plant manages to grow, flower, and take care of itself. In these days of keen criticism, when one begins to write a paper on any subject, and to protect oneself from unkind hits afterwards, it would be safest perhaps to begin with some such remark as that. We are convinced mostly that all things have gained their present state of perfection through an endless series of improvements, for in these times of

ever-quickening speed, and the multitudinous requirements of our own business, one has not always time or inclination to stop and smack our whip at every village cur that chooses to run out and bark and bite at our heels. Apologising for this digression, I will now proceed with my description of the culture of Vanda teres; but am afraid, when finished, critics may say my preface is longer than the subject-matter of the plant in question. Our Vandas were originally planted in 7-inch pots, which form their basal rooting medium still; these were placed along the back bench of a plant-stove, which had about 4 feet of wall up to the glass. To the wall was fastened some wire netting, between which was stuffed a little moss. The Vandas ran up and rooted into the moss, flowering every year freely at the ends of the shoots. They are now clear of the brickwork, and run up the glass roof with the greatest agility. Anyone who does not mind having too much of even a good thing, might, in the way above stated, create a most lovely bank of Vanda which, when in flower, I would back to be in beauty and loveliness nearly equal to the banks of flower one sees along some of the Devonshire lanes. *W. Miller, Combe Abbey.*

Cattleya labiata Gaskelliana.

The question is often asked which of the large-flowered Cattleyas are "labiatas," and which are not? In this case it is very easy to reply, for the above is a true Cattleya labiata, and one of the freest to grow and easiest to flower. In many gardens it is the best and showiest flower of the season, and in the Orchid-house of T. F. Blackwell, Esq., The Cedars, Harrow Weald, some two dozen plants of this variety are at the present time well furnished with flowers. One plant has white flowers with crimson lip, and the others have varying shades of rose and crimson. The plants form part of a large importation made some years ago, and Mr. J. Dinsmore, the gardener at the Cedars, says that the number of spikes steadily increases every year, as does also the quality of the flowers in a slight degree.

OXFORD BOTANIC GARDENS.

Some fine specimen trees of the following species and varieties were noticed in the first week of June, 1894. One of the finest examples of the highly ornamental Ornus europæa, the Manna or Flowering Ash, stands in these gardens. This species is sometimes called the Silver or Round-leaved Ash; Pavia flava, Ailanthus glandulosus, Ostrya vulgaris, Pyrus domestica, P. intermedia, P. communis pendula, Sophora japonica, very fine; Taxodium distichum, Gingko biloba, Salisburia adiantifolia, fine tall specimen of the Maidenhair Tree; Acer Negundo fraxinifolium, Gymnocladus canadensis, Cratægus Aronia, Viburnum prunifolium, Fraxinus pubescens, F. excelsa, Virgilia lutea, Fagus sylvatica var. asplenifolia, a fine sample of the Fern-leaved Beech; F. s. cuprea, a magnificent sample of the Copper Beech, near the gate entering to the new block of houses and corridor; Quercus macrocarpa, Taxus baccata, two fine trees standing together; Betula alba pendula, Cydonia vulgaris, Morus alba, Ptelea trifoliata, Prunus macrocarpa, very fine; a fine tree of the true golden variety of common Yew; Acer monspessulanum, Juniperus virginiana Cytisus Laburnum var. quercifolia, Rhus multifida, Rhamnus catharticus, Pyrus Aria, Cratægus oxyacantha, and C. o. punicea; and the two very useful, late flowering species, Cratægus odoratissima, and C. tanacetifolia, the Tansy-leaved Thorn. A good example of Cerasus serotina was also seen in the garden.

Wall Climbers in the Open.

Few botanic gardens are more snugly enclosed with walls, or more surely sheltered with shrubs or trees than these. The Bath Botanic Gardens have no walls, though their position and environments with trees and shrubs afford them good protection. Still, a few walls afford the best possible for the growth of many climbing and other plants that delight in their shadow or shelter. For example, a whole wall clothed with Roses would possess much botanical interest, and prove of great practical value; and such graceful plants as Tamarix elegans in bloom in the Bath Botanic Gardens in the last week of May would be earlier, as well as more fairy-like, loosely trained over the face of a wall. Few plants are more beautiful on the face of the wall at Oxford than a vigorous wild hardy plant of the common Tamarix gallica in the early days of June, and that in virtue of its foliage alone. There are also several Roses, Vines, and Figs on these fine walls, imparting their own peculiar characters of verdure and beauty, and also affording striking contrast to other climbers or clothers—Magnolia conspicua, M. grandiflora, Virginian Creepers, Ivies, Clematises, Buddleia globosa, Rhamnus utilis, Japan Medlar, Ficus carica, Ephedra distachya, Colletia horrida, Ceanothus azureus, and others; Rose Charles Lefebvre, Periploca græca, Akebia hexaphylla, Bambusa Metake, Rubus frutescens flore-pleno; a very fine old Wistaria sinensis, Japanese Honeysuckles, some golden and other Ivies, Polygonum complexum, Weigela (Diervilla) rosea, Menispermum canadense, Bupleurum fruticosum, Deutzia crenata flore-pleno, Jasminum floribundum, Philadelphus coronarius, Cratægus mexicana, Cotoneaster nummularia, Lonicera discolor, Syringa Emodi, Forsythia suspensa, Thuia japonica, T. j. variegata, Caprifolium chinense, common white Jasmine, Colutea arborescens, Clematis montana, Vitis labrusca, Euonymus japonica, Caragana arborescens, Actinidia polygama, Lycium barbarum, Pimelea, Sarsaparilla edulis (?) (rather severely cut by the frost), Genista ætnensis, Tamarix gallica, Cydonia japonica, Pyrus japonica, Chimonanthus fragrans, Maclura aurantiaca, Bridgesia spicata, &c. Choisya ternata, a very beautiful pure white, sweet-scented shrub, in full bloom on June 1, foliage fresh and beautiful.

Several Roses, as already stated, were noted on south and other walls, some of them not named. Among the named, Rosa multiflora, Reine Marie Henriette, Fortune's Yellow, and a Banksian that looked like Fortune's large white. In another part, side by side, grew the perpetual Rosieriste Jacobs, and the Tea, Madame Lambard; and close to the back entrance were some bushes of old-fashioned and Scotch Roses. *D. T. F.*

KEW NOTES.

Plants in Flower.—The following bulbous plants are now in flower in an unheated frame on the south side of the T range, where a collection of such bulbs as require protection in winter has been established several years:—

Bravoa Bulliana.—This plant was described in the *Gardeners' Chronicle* in 1884 (ii, p. 328) by Mr. Baker, from a specimen grown in a pot by Mr. Bull, and afterwards sent to the Royal Gardens to be cultivated. It is much stronger now than it was then, for instead of the leaves being 6 inches they are 1 foot long by 2 inches in width, and the peduncle is 5 feet instead of 2 or 3 feet. The flowers are in pairs on the upper part of the peduncle, and they are 1½ inch long, tubular below, then suddenly widened and campanulate, with six short recurved lobes, the width across the top being fully 1 inch. The flower is of a dull plum-purple colour outside and yellowish-green inside. The species is a native of Mexico.

Bravoa geminiflora is flowering near the first-named plant, and is a very different-looking plant, its tall slender scapes of nodding, tubular, bright orange-red flowers of small size being decidedly ornamental. It is a plant which deserves to be generally grown for conservatory decoration, and in sheltered sunny borders in the warmer parts of the country. It would be quite hardy in Cornwall, southern Ireland, &c. The Kew plants have scapes 3 feet high, and they have been in flower nearly a month. This species was introduced from the mountains of central Mexico more than fifty years ago.

Crinum abyssinicum.—This plant has been in cultivation at Kew since 1883, when Herr Max Leichtlin presented some plants, but it has not flowered till this year. It is distinct, with subdistichous, glaucous-green, channelled leaves 2 feet in length, and at the base 2 inches wide, narrowing gradually to the apex. The scape is nearly cylindrical, 1 inch wide at the base, 18 inches long, and it bears an umbel of six pure white flowers, in size and form like those of C. capense (longifolium). It has done well planted out in the cold frame.

Hymenocallis Amancæs, the Peruvian Daffodil, is in fine health, and flowering freely in the frame, where it is planted close against the back wall in heavy loam, and is moist all the year round. The leaves are 2 feet long, and the peduncles more than 1 yard high, bearing umbels of large pale-yellow tubular flowers, suggestive of Narcissus Emperor, but more graceful in appearance. Several other species of Hymenocallis are in flower in the same frame, viz., H. calathina, which is quite a hardy plant at the foot of a wall at Kew; and H. Harrisiana, an elegant, free-flowering, easily-grown bulb, which is perfectly happy in an unheated house or frame.

Kniphofia Northiæ is represented at Kew by a group of large healthy plants, which are now flowering in a corner facing south, between the Victoria and Orchid-houses. Its glaucous-green, broad, recurved, keelless leaves are in themselves sufficiently attractive to win the notice of all who know a noble foliage plant when they see it; and its thick spikes of green and red flowers are not without interest, albeit they are inferior to those of most garden Kniphofias. I believe that in a sheltered place in a deep soil in such a place as Falmouth, this species of Kniphofia would attain to the dimensions almost of Agave americana. *W. W., Kew.*

AN AMATEUR'S GARDEN,
BRAEMAR, EALING.

It has been well said that "a beautiful garden is a place of pleasant labour and of happy restfulness, and that the more it can be filled with perfect pictures, the more it gives delight to the eye and solace to the mind, and the nearer it approaches to the making of an earthly paradise."

Ealing is deservedly noted for its well-kept villa gardens, of which Braemar may be taken as a good type. That "it gives delight to the eye and solace to the mind" of the courteous owner, J. Harris, Esq., a busy City man, is beyond dispute, a state of affairs that is very creditable to his gardener, Mr. W. Roberts.

The whole place, glass, lawn, kitchen garden, &c., is only about three-quarters of an acre in extent, but the best use has been made of it. A peep into the glass structures revealed examples of good culture amongst the various occupants. Mr. Harris's gardener is a very successful exhibitor at the local Flower show.

Caladiums are made a specialty of, and are grown well, and to large dimensions. Here, for instance, amongst other fine specimens, is C. Louise Duplessis, in a 16-pot, plant 6 feet across, deep red rays and veins, on a white ground, green margin. A grand plant of Cissus discolor arrests attention, by reason of its fine colouring. Dracænas are likewise well-coloured. D. Massangeana is similar in habit to D. Lindeni, but with a broad band of yellow down the centre of the leaf. Adiantum decorum, 4 feet 6 inches across, is not often seen in better condition than here.

Gloxinias, a "sprinkling" of Orchids, the useful Streptocarpuses, and other well-grown greenhouse-flowering plants, gave the necessary bit of colour in association with the foliage plants.

Outside, things were beginning to look gay. Roses, as a rule, do well at Ealing; the soil seems to just suit them. At Braemar, the late frosts did not improve matters amongst these plants, but still there will be a respectable show of bloom in due time. Some fine patches of Viola Blue King in full flower had a very attractive appearance, associating

well with the deep green of the well-kept lawn. One of the best of white Pinks, Mrs. Sinkins, was flowering profusely in large clumps in the borders, as were the Marguerites (much in request for cutting purposes), the groups of stately Delphiniums, Foxgloves, Pyrethrums, and plants of similar character.

Plums on walls are a capital crop, the principal varieties grown being Victoria, The Czar, Jefferson's, and Belgian purple. Peaches and Nectarines are also showing well. Amongst Apples, the best bearers are found in Wellington, Lord Suffield, Stirling Castle, Norfolk Bearer, and Cellini Pippin. Bush fruit, Gooseberries, Raspberries, and Currants are bearing extremely well; the late frosts, however, did considerable damage amongst the Strawberries. *J. B.*

A TRAVELLERS' NOTES.

(*Continued from p.* 11.)

South Australia—Fruit Culture.—A question of great importance to the colony is the cultivation of fruit; to its exceptional size and appearance I have already referred. The quantity planted appears, at present, too great for the markets so far opened, it being a general belief that gathering does not always result in profit. Mr. Holtze of the Botanic Garden, has bought a 60 lb. case of Tomatos for 2*s.*; Muscat of Alexandria Grape (frequently picked, as is much of the fruit, rather too early), will fall to 1*d.* or 1½*d.* per lb., though the first in the season's market realise 1*s.* to 1*s* 3*d.* per lb. Mr. Ind, one of the oldest residents of the colony, who remembers when the site of Adelaide was under survey, grows one of the chief collections of fruit; his Orange plantations are exceedingly fine and very extensive.

In many of his quarters the plants are twenty years' old, round, even bushes, 15 to 18 feet high, in perfect condition. Planted 24 feet apart, they are extensively irrigated, a requirement offering no great difficulty to this gentleman, the Torrens River running by his grounds. Vines, for wine, he has naturally gone in for largely. They are planted 7 feet apart each way—840 to the acre. His large experience has led him to believe Doradilo is the best Grape for the purpose, and he has therefore planted but few others. Almeria, a Californian variety, is also used; it has a loose bunch and tough skin, and is insipid in flavour. It is a good white, and a fair dessert variety for four months. Under favourable conditions paying results should be obtained three or four years after planting. Pruning begins after April, and the plants are stopped three times before Christmas. Such Vines should yield half a hundredweight each. Black Grapes he does not cultivate, finding them more difficult, and frequently very unsatisfactory to pack for market. Black Prince has been tried, but will not bear after ten or fifteen years old, and the berry cracks after one night's rain. Of this variety he informed me that he had 20 acres; it promises well as a packer. Frontignac fetches the highest price of any wine-grape in the colony, viz., £7 per ton. What a difference to West Australia, where they pay £10 per ton!

Black-spot and sparrows are two dangerous pests; the latter peck holes in the berries, ruining a very considerable percentage of the fruit; the danger of affecting the flavour of the wine when such berries pass into the press is obvious. On black-spot lime and sulphur have no effect, but a solution of sulphate of copper has been found, if not to destroy the fungus, at least to retard its growth, and minimise the evil.

To the other colonies Mr. Ind ships largely; but, owing to the difficulty of getting the shipping companies to store fruit on deck, he has ceased sending to Europe. Some, including Mr. Ind, do not believe in cool chambers, experience having proved deck storage to be more efficient. The best Pear in the orchards here is naturally Williams' Bon Chrétien, locally known as The Duchess. Bishop's Thumb and Vicar of Winkfield, are, however, carrying enormous crops this season.

A plantation of half-standard Apricots, forty-five years old (dating almost from the birth of the colony), is now suffering much from a fungus. Mr. Ind has seen his trees and fruit in perfect condition devastated in sixty hours, the leaves bared in innumerable places, and the fruit spotted.

I also visited the vineyard and extensive cellars of Sir Samuel Davonport. Here Doradilo is much grown; Mataro, on the contrary, does not yield equally good results, though it bears well, and when blended, gives colour; Aromar, a brandy Grape, from the Montpelier plains, is much employed; Serret Bourret is found good, and the soil is considered particularly suitable for Grenache. Muscat of Alexandria and Wortley Hall Seedling, of which I tasted some very fine fruit, as well as Sultana, for drying purposes are all grown. The branches of the plants are kept very short, with the exception of such as Cabenet, the Bordeaux Claret Grape, which yields the best results when long-pruned. In this respect the system is different to that followed in West Australia, and I am almost inclined to think it better.

Sir Samuel's Olive trees are very fine, and he manufactures a considerable quantity of oil, the granite-crushers, lever-presses, and receptacles for which are of the highest order. I may here mention, so numerous are the Olives round Adelaide, that this industry would probably assume great proportions but for the labour of gathering. To any observer a little beneath the surface, there seems to be no question that what the Australian Colonies require is men more than money. As it is, 30*s.* to 40*s.* per week wages to Olive-gatherers will not permit of competition with the cheap labour of Italy.

Grubs (such as I referred to in the vineyards of Western Australia), feed on the young buds of the Vines. Sir Samuel has tried many expedients, and finds a small regiment of fowls the best antidote and the least costly. The grubs bury themselves in the day, and are duly scratched up by the poultry.

The free distribution of Vine-cuttings by the Forestry Department of the Government is in vogue. Last year, the quantity distributed amongst small planters (in addition to the 20-acre plots of land they obtain free), is estimated at 700,000, and the year previously at 1,000,000. Local nurserymen scarcely view this arrangement with pleasure.

The colony suffers as much from acclimatised weeds as it does from such acclimatised animal-pests as rabbits and sparrows.

Gorse, Briar, Artichoke, Prickly Pear, and Bramble, grow and multiply to an alarming extent. Stone Thistle, a species of Centaurea and Bathurst Burr, Xanthium spinosum, fatal to the fleece of sheep, are much dreaded, and the law has rendered it criminal for land-owners to permit its existence on or near their estates.

Stink-weed, I have seen, despite the lack of rain for five months till a few days since, render whole fields, now lying fallow, green and verdant. This, however, can be ploughed in, and to a certain extent grappled with, if done before seeding. *Jas. H. Veitch.*

(To be continued.)

COLONIAL NOTES.

TECOMA SMITHII×.

In your number of Nov. 25, 1893, at page 649, there is an illustration of the shrub "Tecoma Smithii," and it is stated that it is desirable that something more definite should be known of the origin and history of this beautiful plant than has been recorded up to the present, &c.

As I was the raiser of the above-named plant, I will give its history:—

It was raised in my nursery in the year 1882, and is a cross between Tecoma velutina and Tecoma capensis, the former being the seed-bearer. It cannot be relied upon to come true from seed, and all the plants that I send out are grown from cuttings, as I found that not more than from 25 to 30 per cent. come true; even then, they vary in some degree from the original plant. I have raised some hundreds of seedlings and flowered them (in some cases six months after sowing) in 3½-inch pots. Some come precisely like Tecoma capensis in leaf and flower, others of a dull yellow colour, some have much larger flowers than others. I have not as yet raised one with the leaf and flower exactly like Tecoma velutina, which is strange, considering it was the seed-producing plant. It was named after myself by the Horticultural and Floricultural Society of South Australia in 1883, and awarded a Certificate of Merit by that Society, and also by the Royal Horticultural and Floricultural Society of Victoria in the same year. I may state that it is in flower here all the year, and I exhibited it here at the Gardeners' Society for thirty-six monthly meetings in succession.

It is quite distinct from Tecoma velutina, which is in flower here about five months in the year, and loses its leaves in the cold weather much more than Tecoma Smithii×, which retains its splendid foliage all the season, and is a most beautiful shrub, growing to the height of about 10 feet. I have the original plant now in full flower, and this is about our mid-winter. The illustration on p. 649 of the *Gardeners' Chronicle* is a good one. I have grown trusses of flowers of it 11 inches in diameter. *Edwin Smith, Clifton Nursery, Walkerville, near Adelaide.*

FLORISTS' FLOWERS.

THE CARNATION AND PICOTEE.

The tendency with a number of large-flowered varieties is to split the calyx on one side, causing the petals to hang down in an irregular mass. These the growers term "pod-bursters"—a misnomer, as the pod is in the centre of the flower, and between the pod and the calyx are the petals; these, if very numerous, split the calyx in the course of their development, but if the gardener will slit the calyx a little in two or three places on opposite sides before a split occurs, the flowers will most likely open in a proper manner; moreover, it is easy to tie a strip of matting or put a small india-rubber ring round the calyx. The rings can be purchased at the price of 6*d.* per 100; they should be slipped over the flowers when these show colour. Our plants in pots have been removed to the greenhouse in order to develop their flowers in perfect condition and fit for exhibition; but as soon as the flowers are cut, the plants will be placed again out-of-doors. It is a singular fact that the flowers upon pot plants are liable to be injured beyond recognition owing to the attack of thrips, which do but little harm to Carnations when planted out. They should be fumigated with tobacco when placed under glass, to destroy the thrips and green-fly. Some persons, when they see the Carnations and Picotees in bloom in a greenhouse, jump to the conclusion that the plants have been always growing there, and that the florist's type of Carnation is a tender plant requiring greenhouse culture. The very reverse of this is the case, as the florist gets his plants outside as soon as the flowers fade, unless they are required for seed, when it is necessary to keep them under glass till the seed-pods are fit to be gathered. The time has now arrived when it will be necessary to propagate as much stock as possible of the scarce varieties; it is not easy to layer all the growths produced at the base of the plants, for some are too small for layers, others are too high upon the plant to be brought down, and in such cases it is better to strike them as cuttings. They may be planted in small flower-pots filled with sandy soil, and be placed under bell or hand-glasses till rooted, when they may speedily be inured to the open air, and afterwards planted in beds. As the finer varieties come into flower, the best blooms should be selected for cross-fertilisation. The pollen of one variety ought to be carefully transferred from one to the other, and the object intended by the cross ought to be clear to the operator. He must work for a set purpose. Many recent introductions are tall growers, and one object of the florist should be the production of varieties with the same quality of bloom, but of dwarfer growth, which can only be accomplished by selecting as seed or pollen-parent varieties of lower growth; but one of the leading characteristics ought to be the rich colours or fine form of the flowers. For planting out in the garden, many persons prefer flowers of one colour, and do not care for flaked and striped varieties. Yellow and buff-coloured flowers are also held in high estimation. Variety is charming, and the field is so boundless that every taste may be gratified. Those who grow the flaked and bizarred Carnations and the Picotees may cross fertilise all of them, keeping them in their classes; and they will obtain from the seedlings many fine selfs of all sorts of colours. From the scarlet bizarre Carnations, maroon and scarlet selfs will be obtained; from the

pink, crimson, and purple bizarres, those colours will be obtained plentifully in the self forms, so with the scarlet, rose, and purple flakes. All those colours will be produced as selfs. The same remark holds good with the Picotees. Many selfs will be obtained of the same colours as are found upon the edges of the flowers. Cultivators of Carnations from seed must have much patience, it not being possible to obtain flowers in a few months after sowing the seeds, as it requires one season to grow the plants to a flowering size, and then these will not flower well till the following year. Seedlings sown in the spring should now be planted out where they are to flower; and the beds of those already planted out should be kept clean, the ground being well hoed, and the plants freed from green-fly, which cripples them very much, but is only troublesome in hot dry weather. There is still much room for improvement in the class of yellow-ground Picotees, that is, flowers with a clear yellow ground, and a margin of scarlet, crimson, rose, or red of various shades. It will be many years before we are able to obtain the same degree of high class quality in the yellow ground varieties as we now have in the white ground, notwithstanding that so much improvement has already been made, not only in the quality of the flowers, but in the vigour and habit of the plants. The newer yellow ground varieties have now a more vigorous constitution than many of the flakes and bizarres. *J. Douglas.*

WOOD-SILK.

FROM the time of the "grand old gardener" to the present day the vegetable kingdom has been largely drawn upon for the supply of material to construct the clothing of mankind. The ancient Egyptians made linen which is not in texture excelled by that fabricated in the looms of the present age; and the ancient Briton coloured his tight-fitting suit with the dye yclept woad. Taking this word, and altering *a* to *o*, we have the name of the material from which the newest thing in silk is being derived—wood-silk! Cotton, jute, and flax waste, have all been tried, with a certain amount of success—silk from the wood of the Juniper and Oak trees has been taken in hand at Bradford, and forced to yield silk of good quality, which washes well and takes the dye splendidly. Roughly, the process of transformation may be thus described: the wood is pulped in strong nitric acid, and then forced by hydraulic pressure through pinholes in a steel plate into water under certain conditions. This treatment has the effect of solidifying, or turning into a thread, the pulp projected through the aforesaid pinholes. The threads thus formed are first wound on spools and then thrown into a thread of the required strength and size. The material is then ready for the weaver; but there was much danger of chemical action destroying the resulting silk. Friction in manipulation was likely to lead to disastrous consequences, as the material is allied to gun cotton in its nature. To avoid all danger a process called denitration is gone through, which renders the silk non-combustible, the material losing none of its tenacity or lasting properties, whilst the chemical expressed from the mass can, we believe, be used over and over again.

We have said that after being thrown into the yarn condition the silk is ready for the weaver—rather should we say the dyer, who has a most tractable material placed in his hands. The wood-silk has been spun, dyed, woven, and shown in Bradford; and soon, we are informed, a large mill will be set to work in turning out another brilliant example of what may be had from the vegetable kingdom, once we find the key to its secret chambers. The new material, we are told, can be placed on the market at half the price of that supplied by the Mulberry per the Italian worm.

CASTLE BORO, ENNISCORTHY.

A PLEASANT drive of 6 good Irish miles from the busy town of Enniscorthy, and we reach Castle Boro, the delightful seat of Lord Carew, and one of the finest places in County Wexford. The Castle, a spacious and imposing structure of grey granite, is built on an eminence in the centre of the extensive and well-wooded park, and commands a magnificent view of mountain and woodland. On the south front, a series of terraces lead down to the lake, and these, with their tastefully laid-out flower-beds and neatly-planted shrubs, seen in the height of their summer glory, present a sight not soon to be forgotten. To the right of the Castle are the extensive glasshouses, all modern structures, comprising vineries, Peach-houses, plant-houses, forcing-houses, Melon-pits, &c., and containing a large and interesting collection of plants, every one of them "a picture of health." Further to the right are the extensive vegetable and fruit gardens, containing a choice collection of hardy fruit trees.

FIG. 9.—CASTLE BORO, ENNISCORTHY.

In the Park there is a splendid collection of hardy Coniferæ, and also many noble specimens of deciduous and ornamental trees. The estate of Castle Boro is one of the best wooded in the whole of Ireland, the forests carrying many hundred acres of valuable timber, and extending for many miles. The gardens and woods are under the management of Mr. John McLennan, his lordship's head-gardener and forester, in whose hands many improvements have been carried out during the past few years, and to whom we are indebted for affording us a most enjoyable "look round" one of the prettiest places in the south of Ireland. *E. L. E.K.*

PUBLIC PARKS AT NEWCASTLE-ON-TYNE.

(*Continued from vol. xv., p.* 814.)

Leazes Park.—The Leazes was anciently called the Castle field, and according to a tradition, by Grey, was the gift of King John to the townsmen of Newcastle. The portion enclosed is about 35 acres, but the contents in 1731, when a plan was made for the Corporation, was 127 acres 2 roods and 17 perches. The larger portion is absorbed by recreation grounds, and by the moor, which is one of the most extensive "lungs," covering in all over 1000 acres, to be found in England. There was some difficulty in finding out the origin and meaning of the name, but it apparently simply means pasturage. Brockett says that in many parts of the kingdom it is spelt and pronounced leasons; Sax. læsive—a pasture, a common; Norm. Fr., leives, lesus—pasture-ground. The whole of this acreage, over 1000 acres, belongs to the freemen of Newcastle. Bourne thus describes it as "formerly the inheritance of divers persons, owners thereof, who were accustomed from ancient time to take the forecrop there at or before Lammas Day, and after that, by an ancient custom, all the burgesses of this town used to put on their kine, and used the same in pasturing of them till Lady Day in Lent yearly, and then to lay the same for meadow again till Lammas."

The Leazes Park was laid out and opened twenty years ago. It is situated on the north-east portion of the town, and is very much exposed to the blasts. The difficulty with tree-life has been the contention against wind rather than smoke. Now, however, that the beltings are up, the nurse-protection opens up a wider field for introducing greater variety of both tree and shrub life. The best trees are Sycamore, Lime, Service, Ash, Thorns, Rowans, Huntingdon Willow, Wych Elm, Crabs of sorts, and Cherries; Laburnums do moderately well, Weigelas do excellently, and Spiræas of sorts, and Philadelphus, and Lilacs, all do and flower well in their seasons. Beech at one time has been a great Newcastle tree, but the altered conditions of climate have put an effectual stop to its growth, and young ones cease to be introduced freely. The Copper Beech is both a bad wind and a smoke tree, so that the variety that we look for in colour among deciduous trees cannot be had here. Prunus Pissardi is planted to take its place, but that species is ill at ease under wind-pressure. Physical conditions suit most of the trees of the wood admirably, but atmospheric conditions, in the shape of wind and smoke, step in and arrest their progress.

There is evidently considerable care taken by the park superintendent, Mr. Moffat, in keeping the principal subjects well nursed. Without that, many trees would not grow so kindly, and with the exposure the risk of being uprooted would increase. The beltings are pretty well distributed. If anything, there is a want of boldness of lines in the original formation of both walks and borders, and a consequent depreciation in effect of the evergreen undergrowths that confront these marginal borders.

The best evergreen here is the Holly, and the two best-doing Hollies are Shepherdii and Hodginsii. There are laurifolia and some of the silver and gold-blotched sorts, but unless they happen to be in salient positions they are not up to much. On the contrary, the two large green-leaved ones named above are good everywhere. The English Yew is doing well where it is under shelter, without it it gets bronzed at the stem and leaf extremities, and requires the returning summer to recuperate. Rhododendrons, wherever well prepared, or rather provided for in the shape of comfortable living quarters, do well. The dry season has injured some of the ponticum groups even to the extent of being unsightly, but these common fellows are being exchanged for hybrids, which are hardier, and do better under good living. The grouping system is undoubtedly the better way of cultivating this division. Singly, this plant is not much to look at, especially in exposed localities; in groups the species is most effective, and in public parks overgrown plants can be thinned out with impunity and planted in new quarters, which are always cropping up and require furnishing. The Aucuba is invaluable as a town bush, and here it is doing in every way satisfactorily, its fine gold and green-blotched leaves being effective at all times, but particularly in the dead of winter. There are a few other evergreen shrubs of a nondescript character. The Colchican and Caucasian Cherry-Laurels are the more prominent of the large-leaved, light-green kinds, but the winds affect them so, that many of their leaves look as if they had been drawn through boiling-water. Even the broad-leaved Privet, which would be evergreen in cosy and sequestered nooks, was robbed of its leaves here the past winter, or, mainly so, and what was left was maimed with the windy blasts—this, however, is exceptional.

No Coniferous plant of any kind seems to prosper; even the Austrian Pine does not grow kindly, and when it gets up it has to be supported, so that it is scarcely worth the toil. If it were rising above its fellows, it would surely be blown down.

The grass has been well laid down, and is in a capital state of keeping; and the beds for ornamental subjects that are cut out for decorative bedding, are all upon geometric lines. The subjects are such as are in use in general parks, and bulbs come in to do spring duty for gay colouring. The bowling-greens are capacious and well kept, and the games played here are upon Scotch lines, viz., level green, bowling in rinks, not as in central England, greens with raised centres, diagonal bowling, &c. The work of keeping these greens in order is a laborious one, but it brings in some remuneration, as players are charged a trifle.

Coming to the question of income, from that and other sources, the Leazes has been self-supporting. The revenue last year from all sources was £883 7*s.* 10*d.* This seems a large sum to draw from the public, but it was so. Over £500 was taken from skaters alone. There is a splendid lake in the centre of the grounds, of nearly 5 acres in extent, and during frost this lake is covered with skaters. There are also some twelve or fourteen boats for boating, which brought in a revenue of over £200; and there is bowling. All these recreations have to be independently paid for, the Charter of the town Moor Committee reserves certain valuable rights, enabling them to recoup themselves, to a large extent, without a murmur from the public, who go in for these amusements and pay. As an instance of a fortunate speculation, on the great gala night, when the Duke and Duchess of York were married, the Chairman of the Town Moor Management, Joseph Baxter Ellis, said they netted, with that and other galas for the year, £489, after paying for bands, illuminations, and such-like—a splendid take certainly. With £350 of that sum they have built a fountain, set down in the centre of a new auxiliary lake, and lit it up with electric light to illuminate the lake for skating after darkness set in. This is good business, because it draws the people, and out of their combined threepenny-bits swells the revenue. This enables the committee to enrich this park with natural greenery in a way in which it would not likely be done without a valuable asset of this kind. The new lake now completed is about 2½ acres, and being provided with the electric light, is sure to command plenty of skaters in the dark nights of winter, when the ice is safe. There is not the space for getting the outlines of this lake so bold or sweeping as is desirable, but Mr. Moffat has done the best he could with the ground at his disposal. This lake being in the best protected corner of the park, will give much wider scope for greater variety of both trees and shrubs. It is exceedingly desirable that in all public parks the greatest variety practicable should be acquired. The beauties of tree and plant-life may not be appreciated by all, but the greater bulk of towns-people are admirers, and to their credit be it said, they are also in a measure protectors of natural beauties, be they impersonated in either leaf or flower. Children are apt to pilfer, but a watchman with the police garb frightens them from either plundering or marauding. Experienced park caterers have to watch how they dispose of their plants in ornamental grounds. By the side of this lake, instead of having sloping banks on the high side, interspersed with shrubs, rock-stones are improvised, and such trailing plants as Ivies, Periwinkles, Cotoneasters, which is a grand clamberer over and in amongst the chinks of stones, and brightens up the dullness of short days by its numerous crimson berries.

The walks are broad, and in time will be all asphalted. It is expensive work doing an extensive park in this way, but the comfort of promenaders has to be considered, and when the work is once well done, there is little or no upkeep or expense in any way afterwards. The Derbyshire spar makes a bright surface on the top of the asphalte. The principal walks have been already done, more particularly those from the cemented terrace, which will be 100 yards long by 20 yards broad, with fine open balustrade, and flights of steps to the dress-ground below. From this terrace, when weather permits, there is a good view of Newcastle and its surroundings. A very good sample of the bedding system may be seen in the parallelogram on either side of the flights of steps. What a beautiful and useful ground-work plant is the Antennaria tomentosa even in winter it looks like grey gravel, and in summer its shade of colour is much enhanced.

There is nothing in the herbaceous low-growth way that beat Irises, they are as hardy as plants can be. The alpine Auriculas are also chief of their class, and the Wallflower in dead of winter mocks at the blast in the sturdiness of its growth, and in the plenteousness of its flowering. In fine, this park is gaining rapidly in ornamental importance every year, and the house property building round about it is of a better character, drawing better rents, and consequently larger rates to the town exchequer.

Viator.

NOLINA LONGIFOLIA.

Amongst the variety of names under which this plant is known I have adopted that which is given by Baker in his work on the *Arborescent Liliaceæ of the Riviera*, although, I believe, at Kew it is to be found under the name of Beaucarnea.

In the Riviera gardens it is to be found under the names of Dasylirion (which is the most common), Pincenectitia, and sometimes Bonapartea. It is one of the most decorative plants of these gardens, and when seen in large specimens it forms a very prominent feature. The accompanying illustration (fig. 10) is taken from a plant 10 feet in height, with a head consisting of fourteen growths, and carrying five fine panicles of flowers. As a rule, it is rare to find more than two or three spikes at one time. It often occurs that it flowers when only a few feet high, in which case it rarely makes a fine specimen, as it at once commences to branch and becomes bushy. The allied species of Dasylirion, D. acrotrichum, D. glaucophyllum, D. juncifolium, and others all thrive and flower well, the former being met with in most gardens.

The Araucaria excelsa shown in the background is worthy of note as being one of the finest specimens of the Norfolk Island Pine to be found in the Riviera; and, furthermore, it is this year bearing three fine cones for the first time. It measures 63 feet in height, and has a spread of foliage of 37 feet at its base. Its actual age from a seedling is 23 or 24 years, which gives an idea of the rapid growth it makes under favourable conditions.

The two largest specimens which I have met with are at the Villa Les Palmiers, near Nice, which are over 70 feet in height; diameter of trunk at base, 32 inches; and with a spread of foliage of over 50 feet. Their age is just over 30 years. They have fruited annually for the last four or five years. Although gigantic specimens, they have been very much damaged by winds, and have lost the

uniform appearance which is characteristic of this tree. The trees in most gardens have of late years been attacked by a minute white scale, which, owing to the densely-packed leaves along the branches, is almost impossible to exterminate, and in a short time they present a blackened appearance, and in this way many fine specimens have been destroyed.

Fig. 10.—Nolina longifolia (Beaucarnea), at Villa Valetta, Cannes. (see p. 66.)

A. Bidwilli and A. braziliensis attain large dimensions, and produce cones, and, in fact, all the Araucarias flourish, with the exception of A. imbricata, the soil not being suitable to its requirements. *Riviera.*

Nursery Notes.

Roses at Messrs. Wm. Paul and Son's, Waltham Cross.

This is one of the most important of English Rose nurseries, and throughout the summer and autumn a visit is well repaid. Every new kind of value is grown on a large scale, and those interested in seedlings will find many kinds of great promise, some of the recent acquisitions of the firm being in full beauty. Varieties are not grown here sparingly, but one sees their true value by the large masses of each kind, which afford a guide as to its effect in the garden. Much disappointment occurs through visitors to exhibitions selecting their Roses there; as it is impossible to tell the character of a variety from a few cut blooms. One should know something about its habit, freedom in flowering, and other essential points. A Rose shown by the Waltham Cross firm on more than one occasion is the new hybrid China Duke of York, which is beautiful as a dwarf, and also as a half-standard, some plants of it being weighed down with the deep rosy informal flowers, variable, however, in colour, and reminding one of those of L'Idéale. That it is good as a pot plant was shown by their specimens exhibited at the Temple Show. We have seen lately a hybrid Tea called Marquis of Salisbury, a variety that we think will get popular, because so brilliant in colour, the flowers rich crimson, and effective. It is not exactly an exhibition Rose, but a group of it in the garden would be especially bright, and its flowers valued for cutting. As it is of little use to give names or descriptions of varieties already in cultivation, the present notes concern kinds new, or comparatively so. Amongst Teas, we saw several of promise. One of these was named Madame Baronne Berges, an improved Homère it might be called, the flowers full, sweetly-scented, and white-tinted with tender rose. A beautiful Tea is Corinna, raised by this firm, and frequently exhibited by them: the flowers are full, and display a variety of subtle shades, flesh coloured touched with rose, fawn, and copper—a Rose the colour of which it is almost impossible to describe with any degree of accuracy—is in hardy vigorous growth. Another variety raised here and of great merit, is Medea, which, doubtless, is known to the majority of Rose-lovers; its sweetly-scented flowers are delicate lemon in colour, with canary-yellow centre, the growth of the plant, as in the other case being robust. François Menard is a promising continental Tea, very rich in colour, a shade of crimson, lighter in the full globular centre. There appears to be a reaction in favour of dark-coloured Tea Roses, although one usually associates with this section the delicately tinted kinds. Souvenir de Madame Sableyrolles is a variety not much known, and its name is certainly not attractive, but the flowers are very fine, the broad petals tinted with salmon-rose. Rows of that good hybrid Tea named White Lady, raised by Messrs. Wm. Paul, were of note, the strong-growing plants producing large, creamy-white, full-centred flowers. Papa Gontier is a Tea Rose of deep colour, the long well-shaped buds being valuable for cutting, whilst the plant forces well—the colour is rich crimson; another Tea-scented variety, rich rose, with deeper-coloured buds, being Antoine Mermet. A very delicately-coloured variety is Souvenir de Lady Ashburton, the colour varying, but usually of a soft salmon-rose shade. Two hybrid Teas of note raised here are of climbing habit, one is named Princess May, this being of the Gloire de Dijon race, but not so vigorous in growth; its flowers are distinct in colour, being rose, full and large, whilst it is a variety of value for pots to force early in the year. The other kind is named Pink Rover, which has been shown well this season by the firm. This we anticipate will become a popular garden Rose, the habit described as semi-climbing, the fragrant, full, and large flowers of a bright pink colour, deeper in the centre.

A hybrid Tea Rose thought much of is Grand Duc de Luxembourg, which as seen in this nursery is very handsome, the flowers like those of Viscountess Folkestone in shape, and of a lovely rose and white tint. It is free, strong in growth, and quite distinct.

Amongst hybrid perpetuals it is difficult to select varieties when all are in such vigorous condition, but of the new kinds Clio, raised by this firm, is certainly the best; it takes rank with the finest introductions of recent years, rows of plants being a mass of flowers. The plant grows remarkably quickly and strongly, making quite a dense bush, and the foliage is robust; the flowers are large, sweetly-scented, of quite exhibition standard, and snowy-white, with a

delicate rosy tint in the centre. Comtesse B. de Blacas is a promising new kind, the flowers bright rose, sweet, and borne in profusion on sturdy shoots. Caroline Testout is now fairly well known; and another new H.P. likely to become popular is La Fraicheur, which has long, well-shaped buds, the expanded flowers being of very clear rose-colour, more carmine, however, in the centre. Gen. Baron Berges is a good garden Rose, its stout petals of a deep red colour; and Madame Bois we also noticed flowering freely, this being a variety of merit, but not much seen—it is a good H.P., the flowers reminding one of those of Victor Verdier, and bright rose. La France of '89 bears very large Pæony-like, rosy-red flowers, showy, and quite different to those of La France. We may mention that this name is only one example of many that might be quoted as to the confusing nomenclature adopted by foreign raisers. That fine variety, Margaret Dickson, was flowering freely, and special note may be made of the dark-coloured kinds, which seem unusually fine in all nurseries, especially Reynolds Hole, a Rose that does not always appear to advantage.

The polyantha Roses are grown in masses in this nursery, all the principal varieties being represented. A new kind, named Mme. E. A. Nolte, is of note; a very dwarf-growing kind, the flowers at first of a yellow shade, passing with age to a delicate salmon-rose tint, whilst they are not too large. A great fault of many varieties of this section is that the flowers are getting far too large for true polyanthas. Crimson Rambler is blooming in profusion; and very fine at present is Bardon Job, a seedling H.P. from Gloire des Rosomanes: the flowers are of no value for exhibition, but are extremely fine in the garden, being semi-double, and brilliant crimson. A good garden Rose, that is not often seen, is Camoens, the plants strong and remarkably free, the flowers rose in colour, a distinct and bright shade.

We noticed a fine piece of climbing Teas, such as Climbing Niphetos, on the Grifferaie stock, which is especially suitable for this Rose; also plots of standards and own-root plants. Amongst China Roses, the variety Madame Laurette Messimy was as bright as any, the flowers distinct, and bright rose, suffused with a yellowish shade. We are glad to see that the China, Bourbon, and such old-fashioned sections as these are becoming more popular every year for gardens, and when well-planted, they are effective. The Austrian Briers (Rosa lutea), are grown in quantity, as the demand for this class is increasing. The plants when well-grown make fine bushes, especially the showy Harrisoni and Persian Yellow; and another class of note here consists of the Scotch Roses, baskets of which have been shown earlier in the season by the firm. The plants make dense compact bushes, smothered with neat flowers, varying in colour from shades of yellow to crimson.

Each section of the Rose is fully represented, and in the foregoing notes merely a few of the more promising new varieties have been pointed out as a guide to those who do not yet know them. *Visitor.*

HYBRID SWEET BRIARS AT MESSRS. KEYNES, WILLIAMS & CO.'S.

Having heard a good deal about Lord Penzance's Roses at the Castle Street Nursery, Salisbury, I paid a visit to that nursery on the 6th inst., and was shown a batch of 2500 of them, and in full flower. Each of the nine varieties averaged 3½ feet high as they were growing side by side in rows 4 feet apart, and at nearly the same distance from each other in the rows. They were in fine condition, clean, vigorous, graceful in habit of growth, and profusely covered with single or semi-double flowers, varying in colour from pure white, pale yellow, and terra-cotta to crimson, thus adding beautiful and delicate shades of colour to the lightness and elegance of flower, which, combined with their pale green, handsome, and fragrant foliage, seemed to fit them for a place in any garden.

Perhaps there is no method of displaying these hybrid Sweet Briars to better advantage than to plant them singly or in groups of three to five on the lawn, in which position there are several fine graceful specimens of about 10 feet high at Lord Penzance's place, Eashing Park, Godalming. The plants are not only telling objects when in bloom, but also in the autumn when laden with their clustered bunches of yellow hips. The nine varieties consist of the following, viz., Amy Robsart, graceful in habit, and producing lovely rosy-pink flowers of the true Sweet Briar type, with great freedom; Anne of Gierstein, of free growth, of a graceful habit, with large foliage, and dark crimson flowers; Brenda, with peach-coloured flowers, having bright yellow anthers; Flora McIvor, large pure white flowers, shaded with rose, useful for cutting, their beauty being increased by the sprays of young fragrant foliage which show up between the flowers. Lady Penzance, in my opinion the best and most distinct variety of the whole batch, the result of a cross between the Sweet Briar and Austrian Copper Briar. The flowers are of a beautiful soft copper tint with a metallic brightness; at the base of each petal is a patch of yellow, which seen around the clear anthers, forms as it were, a halo, giving the flower a charming effect—flowers and leaves are nicely scented. Lord Penzance is a seedling from Sweet Briar crossed with Rosa Harrisonii; it is a good grower and free bloomer, the flowers passing from a soft shade of fawn to a greenish-yellow slightly toned with delicate pink in the centre. Lucy Ashton is a free erect-growing variety, producing abundantly pretty white, pink edge flowers, which, in point of size, are inferior to the other varieties named; the foliage is very fragrant. Meg Merrilies has a surprisingly robust habit, large foliage, and showy crimson flowers. Rose Bradwardine is a robust growing variety and profuse bloomer, the flowers perfect in shape and of a decided rose-colour. *H. W. W.*

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. H. WHITE, *Orchid Grower, Burford, Dorking.*

BULBOPHYLLUM AND CIRRHOPETALUM.—The species of this genus do not receive as much attention from growers as their merits entitle them to, but as they constitute a numerous group of beautiful and singular-looking flowering-plants, some of them should find a place in every extensive collection of Orchids. When seen for the first time, the delicate mechanism of the lip of Bulbophyllum barbigerum, the remarkable B. comosum, B. Dearei, B. grandiflorum, B. Lobbii, and its variety, siamense, &c.; and the striking umbrella-like spread of the brown satiny sepals of Cirrhopetalum ornatissimum, C. Mastersianum, C. Collettii, the distinct C. picturatum, C. Thouarsii, C. O'Brienianum, C. Cumingii, and the extremely curious C. Medusæ always attract attention. All of these plants will grow freely when suspended close to the roof-glass of the warmest house; and they, therefore, should be planted in Teak-wood baskets or shallow pans, filled to about three-fourths of their depth with clean crocks, and a layer of sphagnum-moss above these, upon which the plants are placed, filling up to the rhizome with ordinary Orchid compost, taking care to mix a reasonable quantity of small crocks with it, as the plants when in full growth require an almost unlimited supply of water. The proper time to re-basket Bulbophyllums or Cirrhopetalums is when the new growths have fairly started, which usually occurs very soon after flowering. As a rule, the plants are not often attacked by insects, but an occasional sponging of the leaves becomes necessary in order to maintain them of a healthy clean colour.

AERIDES AND SACCOLABIUM. — Amongst Orchids which bloom at this part of the season, none is more beautiful than Aërides and Saccolabiums, and their sweet perfume is another attraction, which is the more remarked in the early morning. It is well known among cultivators that in consequence of the free-flowering properties of these plants, and the retention of all the spikes on the plants for an unreasonable length of time, many are quite ruined; and to prevent such disastrous results, it is advisable to cut off the flower-spikes as soon as they are fully open, placing them in water, where they will last for equally as long a time as when left on the plants. After carrying a heavy inflorescence it frequently happens that a plant of Aërides will shed some of its lower leaves, and such plants I would not hesitate, even in the height of summer, to lower in the manner advised in a former Calendar, as I have invariably found that the further the more distant bottom leaves are from the moist sphagnum-moss the greater the tendency to lose their vitality. Another method of dealing with such plants is to remove the old sphagnum moss, and fill the vacant space up to the rim of the pot with additional drainage materials, covering these with living sphagnum moss well up to the bottom leaves, and carefully peg down on to the sphagnum the long straggling roots, which in time form others that will root into it, thus helping the plants towards recovery. The treatment afforded should include more dense shading from sunshine, frequent damping between the pots, and very careful watering at the roots.

VANDAS.—Those of the suavis and tricolor group lose their leaves sometimes, this usually occurring in the summer months. It is mostly attributable to over-flowering, a very hot dry close atmosphere, and other causes. All that these plants need are a well-balanced intermediate temperature, a constantly moist atmosphere, and enough water at the root to preserve life in the sphagnum moss. Abundance of fresh air is at all times necessary for Vandas, therefore the ventilators nearest to them, whether at top or bottom, should never be quite shut. On no account must the plants be disturbed at the present time, the proper season for repotting them being at the end of the autumn.

AGANISIA CŒRULEA. — This beautiful blue-flowering Orchid, once considered difficult to cultivate, is worthy of the attention of amateurs. Being of scandent habit the plant should be fixed on to a block of wood, or to a Teak raft, and hung up in a very high place in the Mexican-house or in a plant-stove, and the roots and foliage when in full growth frequently syringed, and at other times sufficient moisture afforded to keep the pseudobulbs plump. With this sort of treatment no trouble need be experienced in growing or blooming the plant. Other plants requiring similar methods of cultivation are Angræcum imbricatum, Renanthera coccinea, R. matutina, Aracnanthe Clarkei, Aërides cylindricum, and Angræcum Chailluianum, all of which, with the exception of Renanthera coccinea, grow luxuriantly when placed in a shady part of the East Indian house, if well syringed several times daily during hot weather. The Renanthera succeeds in a more sunny position than any of the others. Any of these requiring new blocks or rafts should be seen to at once, as the plants are commencing to make roots freely.

FRUITS UNDER GLASS.

By BAILEY WADDS, *Gardener, Birdsall Gardens, York.*

FIGS IN POTS.—The early forced trees will now, in most gardens, be ripening their second crop of fruit for the season, and will need careful watering, not overmuch being afforded, but sufficient in quantity to keep the leaves from flagging. Figs with their roots in pots should be well supplied with nutriment, and I find nothing better than a handful of artificial Vine Manure given once a week, sometimes varying it with clear soot-water and guano; clean water being supplied at other times. There need be no fear of over-strong growths from heavily cropped trees in pots, provided they are once a year taken out of the bed in which they are kept plunged, cutting off the roots that have grown through the holes in the pots. The syringe should be freely used to keep red-spider in check, except just when the fruit is ripening. Sulphur in the water helps to keep this pest in check, but it is an undesirable substance to employ, as it gets on the hands and clothes; and those who grow Figs like, at times, to come into the Fig-house and partake of the fruit fresh from the tree, find sulphur an abomination. Our Fig trees are syringed twice a day, the water used being of about the same temperature as the air of the house. As the water applied with the syringe descends by means of the stem to the roots, this must be taken into account when affording water to the soil, as must also the fact that the trees are plunged in a material which hinders evaporation from the pot; still, these plants are easily managed if due attention be paid to small matters which may seem trivial to unthinking persons. A favourite variety of Fig here this season is Pingo de Mel, a recent introduction of Messrs. Veitch & Sons—it is large, green, quick-ripening, and very sweet and good; also the variety Grosse Verte is a nice one for pot-cul-

ture. It is a good plan at the present season to syringe, damp-down, and close the house with a sweltering heat, sprinkling a small quantity of guano about the floors, &c. A gentle heat should be kept in the hot-water apparatus, so as to permit of air being afforded at night by means of the upper sashes or ventilators, opening these after the house has been closed for two or three hours. An improvement in the flavour of the fruit, and in the healthiness of the foliage, follows from this practice. There can be no doubt that the best way to ensure good crops of Figs is to grow the trees in pots under glass. They may not always do just as you wish, but with proper regard paid to their requirements, the crops are usually satisfactory; and with two houses, each holding about two dozen trees, a dish of Figs can always be obtained.

THE KITCHEN GARDEN.

By Arthur Coombes, *Gardener, Himley Hall, Dudley.*

VEGETABLE MARROWS.—These plants require occasionally, even in showery weather, thorough root-waterings, for notwithstanding the appearance of the soil at the surface may indicate moisture, it will be dry below. Cut the fruits when large enough for use, and the crop will be larger than if the fruits were allowed to grow to near their full size. Where the plants have space to ramble, no stopping will be needed, but where that is not the case crowding must be avoided by cutting out redundant growth. Those trained on trellises or other supports should have their shoots secured with strong ties of matting. Liquid manure may occasionally be afforded to plants in full bearing, and after warm dry days a damping of the foliage with the syringe in the evening does good.

CARROTS.—The drawing of young Carrots for kitchen use will by this time have accomplished most of the thinning that is necessary. In order to avert attacks of the Carrot-maggot, strew over the beds a dressing of wood-ashes mixed with nitrate of soda, which may be left on the surface or lightly hoed in. Sow seed of Early Horn and any other small, quick-growing variety for drawing whilst young; the ground, if heavy, having some refuse soil from the potting-shed, together with sand, wood-ashes, and soot forked into it; and should the weather be too dry to favour quick germination of the seed, shade the beds with mats.

TOMATOS.—Keep the lateral shoots pinched off as fast as they show, and where the leaves are large, and form a too dense shade, cut them in half, doing this by degrees, so as not to cause a too great check to growth. Fasten the plants securely, but not tightly, to stakes or other supports; and if the soil is dry afford a thorough watering, but not applying liquid or other manure till the crop of fruit is set and the plant in need of support.

ONIONS.—The land upon which it is intended to sow Onions should have a good dressing of rotten dung if it be poor, and be well dug, allowing it to lay as dug till sowing-time, when a dressing of soot and wood-ashes may be hoed into it.

WINTER SPINACH.—A first sowing of this generally important vegetable may be made, the ground being dug, and a day or two afterwards stirred with a digging-fork, to enable the birds to find the grubs. Before sowing, dress it with soot, forking or raking this in. The drills may be drawn rather shallow, at $1\frac{1}{4}$ to $1\frac{1}{2}$ foot apart, sowing the seeds thinly and evenly. When the plants are sufficiently advanced to handle, thin them out to 3 inches apart, and eventually to 6 inches. The ground, if not tenacious and very moist, should be lightly trodden before the drills are drawn, so as to ensure a firm seed-bed.

PEAS.—The points of the shoots should be nipped off when the last flowers are set, and thus induce a free swelling of the pods. Applications of liquid manure may be needed, to enable the plants to finish their crops satisfactorily. Late varieties ought not to be allowed to suffer for lack of water at the root, as this is a frequent cause of mildew.

PLANTS UNDER GLASS.

By J. F. McLeod, *Gardener, Dover House, Roehampton, S.W.*

POINSETTIAS.—So as to ensure fine heads of bracts in the winter months, the striking of the cuttings should not be delayed after this date. The exudation of the milky juice of the cuttings is stopped by dipping the wounded ends into finely sifted silver-sand and charcoal-powder; and a hot bed with mild bottom-heat is a suitable place in which to strike them. Whilst in the cutting stage moisten the foliage twice a day, and shade them from the sun so that the leaves may not flag in the least. Plants which were rooted earlier should be growing in pits and frames, and the forwardest of them which may need shifting may be put into 5-inch pots, using as a potting soil rich loam and leaf-mould, and plenty of sand. After potting the plants, stand them near the glass, and afford a fair amount of ventilation, but avoid cold draughts. Green-fly, which often infests the plants, can be prevented from doing much harm by syringing the foliage late in the evening once a week with soot-water, a mild fumigation on two consecutive nights being given should the insects have established themselves in large numbers.

POT ROSES.—With an abundance of Roses in the open air, the Rose-bushes in pots are apt to be overlooked, but if good returns are expected from them, the treatment best calculated to give them should be afforded. If the pot-plants are standing on a thick bed of coal-ashes, in a fairly sunny position, let them not be crowded, but stand them wide enough apart to permit a considerable amount of direct sunlight to reach them. Any that have not been repotted this season will benefit by an application once a week of well-diluted farmyard manure-water, to which a small quantity of soot is added, the strength of the manure being increased when the foliage gives evidence of renewed vigour. To maintain a clean and healthy appearance in the plants, syringe them sharply twice a week. If mildew should show itself, use as an antidote the Bordeaux Mixture, or other safe fungicide.

GLOXINIAS.—When some particular variety is to be increased, leaf-propagation should be adopted, and use made of deep seed-pans half filled with crocks, over which a layer of moss should be laid, and the pan filled up with a light porous soil. The full-grown leaves, with about half-an-inch of leaf-stalk, and the ribs left entire, should be cut from the plant, and inserted round the edge of the pans, allowing them to slightly overlap each other. Stand the pans in a Melon or Cucumber-pit or house in somewhat shady part.

HINTS ON CURRENT OPERATIONS. — Zonal Pelargoniums, owing to the dull weather, will drop many of their petals, which, if many are grown, causes much labour in keeping the show-house tidy; but the plants should be cleared of these and decaying flower-trusses daily. Zonals which have not been recently repotted should be afforded liquid manure, or if that be not practicable, some inodorous artificial kind put in the form of powder on the soil. Frequently re-arrange the plants in the houses, and apply manure in some desirable form to those which need it.

THE HARDY FRUIT GARDEN.

By T. Turton, *Gardener, Maiden Erlegh, Reading.*

THE PRUNING OF APPLES AND PEARS.—The growth of trees having been checked by the cold weather in May, the usual pruning must be postponed till such time as more and healthier growth has been made, thus avoiding a check to the fruits, which are small for this part of the season. Exception may be made in the case of trees not in bearing which are making strong growth; the pruning of which, which may be carried out piecemeal by cutting some of the shoots (those that will not be required to form the crown) to three or four leaves, and in about one week afterwards completing the operation, but leaving the leading shoots intact till the winter pruning.

STRAWBERRIES.—Finish the layering of those varieties which are usually late in forming runners, remembering that the earlier in the season the plants are planted out, the heavier will be next season's crop of fruits. The earliest-layered runners will soon be ready for planting out; and where the land intended for making new plantations was prepared as directed in a former Calendar, by trenching and well manuring it, and then planting it with early Potatos, it will soon be available. With land thus managed, it is merely necessary before planting to make the surface level and firm by trampling it; and the more expeditious method of levelling is to shallow dig it. Where the land may not have been thus prepared, that which has carried early Peas will be suitable; and in the event of the manure having been placed too deep for Strawberries, some well-rotted manure should be dug in deep enough to be just out of the way of the planting-trowel. Land not prepared in any way should be liberally dressed with rotten manure, placed in two layers, and be trenched two or three spits deep according to its quality. It is only by encouraging the plants to root deeply, that they escape suffering in dry weather. In the southern parts of the country certain provision should be made for planting a north border with Strawberries, so as to afford a long succession of the fruits; and during very hot weather the fruit from cooler borders is superior in flavour to that from plants exposed to full sunshine. For a number of years I have always had a north border planted with them in these gardens, from which we have usually gathered our finest fruits, the kinds being Sir Joseph Paxton and President. [The Hautbois is a variety that is excellent from a north border. Ed] Strong growers may be planted 3 feet from row to row, and 2 feet in the row.

MATERIAL FOR PACKING FRUIT.—A very suitable material, according to my experience, for packing such fruits as Peaches and Nectarines, Pears and Apples, and one that is obtainable by every gardener, is the lawn mowings after freeing them from leaves and rubbish. These should be saved, dried by being turned in the sun, and stored away in hampers. In gardens where the lawn mowings are unsuitable, the mown short grass from the cricket ground may be used instead.

THE FLOWER GARDEN.

By John Lambert, *Gardener, Powis Castle, Welshpool.*

THE LAYERING OF CARNATIONS AND PICOTEES.—The present is a suitable time at which layering may be commenced. The earliest layers are invariably the best for planting out in October, and they are enabled, by being early planted, to obtain a strong hold of the soil before frosts of any severity occur. Refuse soil from the potting-bench, when finely sifted, forms a good medium for rooting the layers, soot, sand, and leaf-mould, or bone-meal in small quantity being added. Before beginning, provide plenty of small wooden hooks, and having cleared away weeds from about the plants, stir the soil lightly, then place as much of the prepared soil as will raise a mound to a convenient height round about the plant to be layered—usually, 3 inches in depth will suffice. Choose six short-jointed shoots of about 8 inches in length, remove any weakly shoots that may be thereon; and this being done, pull off the leaves from the lower part, but leaving those above, the tips of which should be gathered in the hand in a bundle and cut off. Select the clearest part of the bared shoot, and on the underside, just below a joint, cut half-way into the shoot, and pass the knife-blade in an upward direction, splitting the first joint met with in half, and continue to about half-way towards the next above it. Make a broadish shallow hole in the fine soil, and place the slit part of the shoot therein, raise the top of the shoot so as to open the cut, and put a peg gently yet firmly across the layer, filling-in with soil, whilst keeping the layer upright. When a plant has been layered, afford water with a fine-rose can, and pass on to the next. If the plants stand a good way apart, the soil may be left saucer-shaped on the top, so as to retain water, instead of being flat and allowing much of it to run to waste. Water the layers if dry weather ensue, and sprinkle them overhead after bright days, and in about six weeks they will be rooted.

THE HERBACEOUS BORDER.—Constant attention must be given to tying up the stems, shoots, and flowers, and in removing spent blooms and seed-vessels. Pæonies, Papavers, Iberis, Doronicums, Phyteumas, and Aquilegias, will need this attention; whilst others, such as Galegas, Malvas, Rudbeckias, Lathyrus, Diplacus, and Asters (Michaelmas Daisies), Lilies, Tritomas, Phloxes, &c., will require to be neatly secured to stakes. Many of the stronger-growing plants, such as Asters, Helianthus, Galegas, whose foliage prevents the soil in which they are growing being accessible to the rain, should be thoroughly soaked with weak soot or manure water. Pyrethrums of any variety which have failed to do well, or are scarce, should be taken up, and carefully divided, and having filled some 60's with a rather light sandy soil, put a piece into each, sprinkle them well through a rather fine rose, and place in a cold frame facing north, and keep close for a short time. These bits will make nice planting stuff for putting out at the end of the month of September, or for keeping in pots till the spring. The less hardy Veronicas may be treated in the same manner.

EDITORIAL NOTICES.

Advertisements should be sent to the PUBLISHER.

Letters for Publication. — *All communications intended for publication, as well as specimens and plants for naming, should be addressed to the* **Editor, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.*

Plants, Fruits, &c., to be Named.—*Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be good ones, carefully packed and numbered, and not more than six should be sent at one time. Leaves only, or Florists' varieties cannot, as a rule, be named.*

Newspapers.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.*

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

TUESDAY,	July 24	Royal Horticultural Society's Committees, at the Drill Hall, James Street, Westminster.

SHOWS.

SATURDAY,	July 21	Manchester Royal Botanic Society: Roses, &c.
TUESDAY,	July 24	National Carnation and Picotee Societies Show (Southern Section), in connection with the Royal Horticultural Society's Committees. Royal Horticultural Society of Aberdeen. Rose Show at Tibshelf.
WEDNESDAY,	July 25	Beckenham Horticultural Society. Burton-on-Trent Horticultural (two days). Surrey Horticultural Society, Herne Hill.
THURSDAY,	July 26	Rose and Horticultural Shows at St. Ives and Southwell.

SALES.

TUESDAY,	July 24	The Coventry Hall Collection of Established Orchids and others, at Protheroe & Morris' Rooms.
THURSDAY,	July 26	Unreserved sale of the Orchids and Plants at Albert Nurseries, Peckham Rye, by order of Messrs. E. D. Shuttleworth & Co., by Protheroe & Morris.
FRIDAY,	July 27	Imported and Established Orchids at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—63°.4.

The utility of Herbaria.

The last report of our valued correspondent, Professor MacOwan, on the work of the Government Botanist at Cape Town, contains several passages which are as applicable north of the Equator as they are at the Cape. Professor MacOwan writes as follows of the comparative values of herbaria and of botanical and experimental gardens, a point discussed at some length by the late Alphonse de Candolle, but who, as we think, placed too low a value on a properly-administered and well-labelled garder as a means of botanical study.

Just what a great library of reference is in literature (says Prof. MacOwan), such is a national herbarium in all matters connected with the phytography of a country. What a district produces by Nature affords the key to what it may produce by art and culture, and to the indication of the special regions where experiment should be made, so as to get the best chances of success. It is often supposed that botanic gardens fulfil these conditions. They are very far from doing more than a small specimen of such work. Unfortunately, there is, we are told, not a single botanic garden in the whole of South Africa devoted to the work of trial by culture, and rendering a yearly account of experiment and result. It is significant that these institutions in their annual reports dwell most on their account sales and the money made by trading. Such more or less successful public promenades, scattered over the Colony, afford pleasure to the inhabitants of the places where they are located, but not one of them is in any sense a station for research. All but two are dependent on a more or less extensive nursery business, and are run on purely business lines, competing with a never very lucrative trade carried on by private citizens. The Colonial Botanist would be glad to see every one of them stopped from this unfair interference with private enterprise, and compelled to draw the full amount of their support from the rates of the township that benefits by them. Under present conditions, the staff must be nurserymen pure and simple, with all their faculties sharply alive to supply and demand, and, by as much as they devote time to experimental trials which do not bring in money, but only knowledge, by so much are they worse fitted for the peculiar duties of their place. The two largest municipalities in the Cape Colony have, we are told, practically wiped out the "botanic garden" abuse from their midst, and thrown the maintenance of their local pleasaunce of flower and tree upon their own local rates. But under these more equitable conditions no public pleasure garden is a fit place for either botanical science or scientific cultural trials. The formal outline of a hundred beds laid off for test cultures of rust-resistent wheats, for example, is as little ornamental as a hundred test-tubes in the chemist's laboratory. The contributory public would have none of such homely non-æsthetic work, and would treat the attempt to join the conditions of an experiment station with those of a pleasure garden, just as they would treat the combination of an analytical laboratory with an Art-gallery.

These are the considerations which make the maintenance of a Government Herbarium a matter of public concern. It provides in a very economical way for the authentic record of the phytogeographic data of every part of the Colony. What grows, and by inference what will or will not grow in any given locality, can be deduced with some approach to certainty from the accumulated facts attested by the native flora of the place. Moreover, every question as to probable economic or medicinal value of native plants comes to the herbarium, not to the botanic gardens. Every dangerous weed, every interloper creeping into our cultures like stowaways aboard ship, gets hauled up for judgment there, along with the more flagrant misdemeanants, the parasitic fungus-pests, and is tried by herbarium standards. The botanic gardens are out of it altogether. Even supposing the Government were to establish, as Mr. MacOwan sincerely hopes it will some day, one or two experiment stations, the herbarium will still be a prime necessity; the two elements of research being mutually the complement of each other. Such lists of the species peculiar to a given area are the first term in working out the botanico-geographic distribution of plants within the Colony, and represent the most useful work just now open to local botanists.

And now comes a passage with the spirit of which we deeply sympathise: "And on this point of asking for authentications of the names of plants, a work requiring much care and time, I should like to reason with the local botanist a little, or with the flower-dilettante rather. It is quite a common practice to slip into an envelope a few withered scraps of wild plants, neither dried nor packed, and ask their names. The only result is, that at the expense of the curator's labour the sender gets a set of names which he should have worked out for himself from the Flora, and is encouraged in a form of intellectual laziness."

Colonial Fruits and Woods.

As English soft fruits appear on the scene, those from the Colonies gradually shrink in bulk, and shortly disappear. Very fine have been the Grapes, Peaches, Pears, Apples, &c., forwarded from S. Africa and Australia—the Apples being specially picked samples, and their retail price having been correspondingly high. It is in this way that vendors who supply the best fruit, placed on the market in the best possible condition, will get an adequate return for their enterprise. As is pretty well known, had they been forwarded, four times the quantity of Cape fruits would have found purchasers at good prices; and the question is natural, why are not more sent on? Well, the answer is a very simple one. There were no more to send—every Peach, Pear, and Grape that could be spared from the home market were sent here. What these were like, consumers best know—as a whole, the Peaches were of a high class, and came to hand free from blemish or damage in transit; all the fruits being kept in the cool chamber at as near as possible an average temperature of 40°, and the packing being the result of some three or four years' experience. So fair have been the results of placing Cape Grapes, Peaches, &c., on the English market, that as the years progress the supply will increase; high-class Grapes are being cultivated, so also all other fruits saleable in London, and as the trees mature, the fruit will be packed and sent on here. All the great steamers of the "Castle" line (Donald Currie & Co.) are fitted with refrigeratory machinery of the best kind, and the accommodation for fruit is all that can be desired, especially in the three vessels last added to the fleet; there is no waste of power in compressing and expending air, and the internal temperature can be had at any time without the slightest inconvenience—and we are happy to think that some remarks of ours, made some year or so since, have not fallen idly. The gentlemen who manage the "Castle" line are confident of a great future for the Cape fruit trade with the mother country, and are quite ready for it.

A few words now as to colonial timber; and first we may note with some satisfaction that Sir E. Braddon, K.C.M.G, formerly Agent-General for Tasmania, has given as Premier of that colony some proof that he read his *Gard. Chron.* with care whilst in his Westminster chambers, and especially where we have had occasion to call attention to the seeming lassitude of some colonial officials in the matter of placing on the English market proper samples of the woods at their disposal in paying competition with those of countries not affiliated to the old country by ties of birth. We had hunted about in London for specimens of Tasmanian timber, in vain. The fact was recorded in these pages, and to-day there are on their way to England 300,000 blocks of Tasmanian wood fit for street paving. This fine result is due to the action of the new Premier, and is, we trust, only the beginning of a large trade with the lumberers of one of the prettiest spots on the face of the earth, whence come, as is well known, some of the best imitations of the English-grown Ribston Pippin!

Royal Horticultural Society.—The next meeting of the Society will be held in the Drill Hall, James Street, Victoria Street, Westminster, on Tuesday, July 24, when the National Carnation and Picotee Society will also hold its annual exhibition. At 2.30 a special general meeting of the Fellows will be held at the offices, 117, Victoria Street, to consider the adoption (or otherwise) of a new bye-law relating to life subscriptions. At 3 P.M. a paper on 'Filmy Ferns" will be contributed by Mr. J. Backhouse of York. The Council would be grateful to growers of these beautiful Ferns for living specimens for exhibition on this occasion.

The National Rose Show.—The consensus of opinion of those who were so fortunate as to have witnessed the great southern Rose Show at the Crystal Palace, on Saturday, July 7, would be, we surmise, that as a show of the beautiful flower, it was charming in every way. The individual blossoms being fresh, and maintaining their freshness to the end of the day, only the professional critic would note a lack of vigour, and taken as a whole, of size, also in the blooms, whilst the general brightness of colour was maintained. The slight weakness would be traceable to those dreadful frosty chilling days of May 20 and 21, which with their withering north-east blast caused so much to go by the board which had been till then so full of promise, in flowers and fruits. This season is a late one for Roses, notwithstanding the intense heat recently felt in the south, and we may therefore expect some good blossoms for a few weeks to come, especially as the plants will be much helped and invigorated by recent rains and cooler weather. There was a considerable number of new Roses shown, but in how far their merits transcend older varieties, only time can tell. Marquess of Salisbury is a "garden Rose" of a remarkable shade of bright crimson, semi-double, with the anthers showing as soon as the flower expands. It is pretty, and if the growth be strong, it would make a showy pillar Rose, a bedder, or a wall Rose. Camoens, a H. T., is an irregularly-built, deep pink-coloured semi-double "garden Rose," the stamens not very visible. Mr. Bateman had those very nice novelties, Caroline Testout, Miss Shannon, and Dickson's Roses, Margaret Dickson, Marchioness of Londonderry, and Marchioness of Downshire — all pale varieties, and as flowers grown within 4 miles of Charing Cross they were very good examples. The same varieties were shown by Rev. J. H. Pemberton. As might have been expected, from the more favourable surroundings of Havering-atte-Bower, they were of better quality, but not so much so as one would have imagined. The fine Roses that are grown within a radius of 8 miles of Charing Cross were a surprise to all those who hold the opinion that the inimical influences of smoky London forbid the cultivation of Roses. As we are writing of clergymen's Roses, it may be here remarked that those shown by Rev. H. A. Berners, showed capital finish in every point, they were not over large, but well chosen for evenness of size — the Countess de Nadaillac, Etoile de Lyon, Ethel Brownlow, Madame Hoste, and Edith Gifford, would have taken points anywhere. It was this lot of eighteen Teas which won for the exhibitor the Amateur's Challenge Trophy. Noted among Roses as not being well-shown by amateurs, was the variety Mrs. J. Laing, the flowers always being undersized. Perhaps it is only here and there from a very large number

Fig. 11.—Cochlioda Noezliana: orange-scarlet. From Major-General Lucie Smith.

Cochlioda Noezliana.—This handsome and distinct novelty is an introduction from Peru, and named in honour of M. Jean Noezli. The pseudo-bulbs are ovate-oblong, compressed; the leaves linear-acute; scape many-flowered; sepals and petals orange-scarlet, the trifid lip of the same colour, with a yellow disc, the column violet-purple. Cochliodas are evergreen, and do best in the cool-house in suspended baskets, as the drooping flower-spikes are then seen to advantage. The plants require a compost of sphagnum-moss and peat, and liberal watering during the season of active growth. The plant from which our illustration (fig. 11) was taken is in the possession of Major-General Lucie Smith, The Acacias, Worthing, and this year carried ten spikes and 106 flowers.

of plants, that extra fine blooms can be gathered; hence the failure of small growers to produce it so finely as the large ones. Contrariwise, Ulrich Brunner and Merveille de Lyon were generally up to the mark in amateur stands, and no other Rose was more common than the pale beauty last named. The stand of this variety, shown by Rev. H. A. Berners, was the best we have remarked. The favourite, La France, is not a success this season, and but few nice blooms graced the stands. Dr. Sewell is a deep crimson flower, flattish in form, that came out in fine condition in Rev. Foster Melliar's stand, as did Souvenir d'Elise Vardon, Horace Vernet, Baroness Rothschild. Mr. S. P. Budd's Her Majesty was just of the right size, but some growers would prefer Mr. T. B. Haywood's example of this variety. At any rate, neither erred on the side of excessive size. Lady Mary Fitzwilliam was sometimes observed in great beauty, and but seldom Maréchal Neil. The flowers sent by Mr. Mattock and Mr. Prince, of Souvenir d'Elise and Countess de Nadaillac were of extraordinarily good quality, and generally the Oxfordshire flowers beat those of the eastern counties for size, form, crispness, and freshness. Nothing, indeed, could have been finer than Mr. Prince's Madame de Watteville, The Bride, Souvenir d'un Ami, Catherine Mermet, Duchess of Bedford, Comte de Raimbaud and Mons. Noman, which was seldom good elsewhere. We will conclude our remarks on this show with a short list of varieties that were seldom seen in first-class form. Alphonse Soupert, Françoise Michelon, Duchess de Morny, Duke of Teck, Margaret Brassac, Innocente Pirola, Duke of Edinburgh, Louis van Houtte, Harrison Weir, and Etienne Levet.

The Gardens at Olympia.—It has been the aim of the directors of this popular place of entertainment to provide a beautiful and attractive promenade. No fewer than 400 Lombardy Poplars have been planted, and form a magnificent screen of foliage; while the wealth of shrubs and flowering plants, very tastefully arranged in circular beds and serpentine banks, will bear comparison with any horticultural display in the metropolis. Here and there walls and fences have been covered with virgin cork, with pockets for holding plants. In picturesquely contrived grottos the plashing of the waters makes refreshing music, and from end to end are to be found hanging baskets radiant with bloom. The illumination of these gardens has been carried out on a scale never before attempted in this country; and the whole is a perfect harmony of crystal devices consistent with the Oriental character of the exhibition. The promenade is beneath a series of crystal arches illuminated by gas, with illuminated crystal temples, that at the eastern end being perhaps the largest piece of crystal work ever attempted. At the western end is a series of Turkish arches in crystal work. This well-arranged garden, which is a narrow strip running along the whole of the southern side of the building, excellently adapted as a promenade and breathing space for visitors, was furnished and planted this year by Messrs. J. Laing & Sons, Forest Hill, S.E., with a very fine assortment of Conifers, Rhododendrons, variegated and green Hollies, Aucubas, Ivies, and other Evergreens of various dimensions. Flowering plants have been profusely planted, including several beds of the finest single and double-flowered tuberous Begonias. Everything is in first-rate condition, and gives one the idea of a place that has been established for several years.

Stock-taking: June. — The more recent intelligence from both North and South America, Italy, and France, must have acted as a deterrent to those inclined to prophesy concerning trade and commerce before knowing; although the outcome of the revenue for the first quarter of the financial year must have helped to raise the expectations of those on the outlook for the trade and navigation returns for June. In them the imports side of the account shows an increase of £2 380,441, as compared with the same month last year, yet the exports show a falling off, to which attention will be drawn presently; our customers abroad are still anxious to sell in a market where prices do not show much inclination to rise, and the following extracts from the summary table of imports for the past month will be found satisfactory:—

Imports.	1893.	1894.	Difference.
	£.	£.	£.
Total value of imports	£31,869,592	£34,250,033	+2,380,441
(A.) Articles of food and drink—duty free	12,462,886	13,427,241	+934,355
(B.) Articles of food and drink, dutiable	1,625,943	1,437,755	—188,188
Raw materials for textile manufactures	4,519,062	4,390,045	—129,017
Raw materials for sundry industries and manufactures	3,462,845	4,362,931	+900,086
(A.) Miscellaneous articles	1,035,136	1,111,903	+75,767
(B.)—Parcel Post ...	53,727	96,806	+43,079

It may be worth noting here that the imports of timber show an enormous increase over those for June, 1893, and that the entries for the past six months show an increase of £13,349,937 over those for the same period in 1893; and this increase is, with few exceptions, spread over the entire field. The annexed excerpts from the general figures, concerning the arrivals of fruits, roots, and vegetables, is of interest to all:—

Imports.	1893.	1894.	Difference.
Fruit, raw:—			
Apples ... ... bush.	39,857	38,196	—1,661
Cherries ... ... ,,	196,213	193,231	—2,982
Plums ... ... ,,	28,053	3,731	—24,322
Pears ... ... ,,	4,732	157	—4,575
Grapes ... ... ,,	5,186	4,036	—1,150
Unenumerated ... ,,	236,708	245,697	+8,989
Onions ... ... ,,	139,120	328,548	+189,428
Potatos ... ... cwt.	1,100,643	1,256,263	+155,620
Vegetables, raw, unenumerated ... ... value	£ 184,241	£ 170,550	£ +13,691

The number of minus (—) "differences" will doubtless attract attention; the "plus," of course, is on our side! Amongst the "unenumerated" fruits, are doubtless some from a country coming to the front for agricultural settlers, from this and other lands, with a superabundance of skilled agriculturists. The republic of Honduras, in the land of the mahogany tree, there are grown to perfection the Mango, Pine-apple, Custard Apple, Alligator Pear, Lemons, Limes, Oranges, Bananas. It is in the dairy-farming line that help is needed from purse and skill—the production for home-sale of milk, butter, cheese. Those of us whom this may concern, can make a note of the matter. And now as to the

Exports.

for the past month. They are less than those for June of last year by some £876 116—the deficit for the past six months being £894,465. Well, considering the bad news from the various countries noted above, the wonder is, not that there is the falling-off noted, but that it is not greater. These exports are entirely of British and Irish manufactures; if we add to them the increase in those of foreign production—£402,165—the account does not appear quite so black—shipowners, at any rate, profiting by the bulk of export. There is, of course, no getting away from the fact that the delay in passing the American Tariff Bill is one great cause of the falling off in exports, and the delay may possibly be extended over another month; and this, coupled with the present condition of things in the labour market of America, gives no encouragement to textile manufacturers here. We can only hope for a speedy reconciliation between the contending parties in the great republic, which would greatly aid in the promotion of a busy and profitable trade with this country.

English Flower Shows.—An American who has been taking notes among us, records his impressions in a recent number of *Garden and Forest*. He visited the Temple Show, whereat he says, no such magnificent spectacular effect is possible as in Madison Square, New York, but "after all, as the plants are shown for their own sake, and not for the purpose of decorating the enclosure in which they are exhibited, the loss of this general effect is not serious. But even if it had been desirable, as a study in artistic arrangement, to attempt any comprehensive picture, the material for such work was not at hand. Specimen Palms, Tree Ferns, and similar plants . . . were altogether lacking; nor were there any splendid masses and groups of decorative plants, such as the writer has often seen in Philadelphia and New York." On the other hand, our critic awards us the palm for the number and variety of the plants exhibited, and for the general cultural skill displayed. Cut Roses did not impress our friend (it was in May!), but the pot Roses excited his admiration, as well as Messrs. Smiths' Clematis. The Regent's Park show comes in for a share of praise for its beautiful arrangement, but both societies are counselled to advertise more effectively!

The Export of Vegetable Tallow from China.—The introduction of vegetable tallow from Excæcaria sebifera into Marseilles from China for candle-making has already been noticed. We now learn that this export from Hankow is a revival after a lapse of twenty years. During the last quarter of 1893 there seems to have been a very strong demand at Hankow both from natives and from foreign exporters, so that a considerable advance was expected during the early part of the present year. The quantity of vegetable tallow that could be produced, if there were a demand for it, is stated to be practically unlimited.

"The Botanical Magazine."—The plants figured in the current number are:—

Houlletia Landsbergi, Linden and Rchb. f., t. 7362.—A native of Costa Rica, not of Brazil, as at one time supposed; long known in gardens, but, nevertheless, rarely met with. The flowers are 3 inches across, the oblong acute segments yellow, thickly beset with chocolate-brown spots.

Gastrochilus Curtisii, Baker, t. 7363.—A Malayan Scitaminea, with tufted pubescent leaves, and white Orchid-resembling flowers. It was discovered by Curtis in Penang, and by him sent to Kew.

Colocasia antiquorum, Schott, t. 7364.—It is singular that no good modern figure of this plant should exist, in spite of its being one of the most widely cultivated tropical food-plants in existence. As might have been expected, it varies a great deal, and a host of synonyms has aggregated around it. The part eaten is the tuber.

Æschynanthus Hildebrandii, Hemsley, t. 7365.—A low-growing Burmese plant, with small opposite ovate acute leaves; flowers about 1 inch long, corolla curved tubular, two lipped, deep orange, with projecting purple stamens.

Spathoglottis gracilis, Rolfe, t. 7366.—A handsome yellow-flowered species. The leaves are plicated, broadly lanceolate; the flowers racemose, at the end of a long erect peduncle; each flower flattish, with five ovate oblong yellow segments, and a very deeply trilobed lip. Native of Borneo.

"The Chrysanthemum Grower's Record."—This is a small octavo volume, intended for the use of the exhibitor chiefly, and which will afford a ready means of reference with regard to the following matters, the pages being ruled and marked for the number, the name, and description of variety (what class it belongs to); cuttings, when inserted, when rooted, when potted into 60's, 54's, 48's, 32's, 24's, 16's, and 12's, for the designer evidently favours progressive repotting. Then there follows a column "when stopped;" another for first break, with two sub-divisions; and one for second break, with also two sub-divisions. Columns for indicating when the buds were visible and when taken; another for stating if crown or terminal; one for date of com-

mencing to feed; also for colour, time of housing, height, and number of shoots; and place for remarks on soil used at the final repotting, &c. The *Record* contains 192 pages, space, therefore, for remarks on that number of varieties. It is to be obtained of Mr. JASON FEARS, Hon. Secretary of the Hertford Horticultural Improvement Society, for the price of 1*s*.

"CYCLAMENS, AND HOW TO GROW THEM."—In this little manual by Mr. F. G. EDWARDS, Levenshulme, Manchester, we have a succinct account of raising and flowering the Cyclamen in the short period of twelve months. The instructions given are excellent, and embodied in plain language; the plant being followed through its various stages, from the germination of the seeds onwards. We should suppose that any hitherto unsuccessful cultivator of the Cyclamen, with this manual in the hand, could scarcely fail to achieve satisfactory results. It is a pity the author had not invited the aid of some competent assistant to revise the text before issuing the manual to the public, for it abounds with clerical errors of all kinds.

THE JOURNAL OF THE JAPANESE HORTICULTURAL SOCIETY continues to appear monthly. The contents are printed in Japanese characters, but the title-page contains press announcements in four European languages, and correspondence in these tongues is invited. It is a record of an apparently flourishing society, and to those to whom the letterpress is more interesting than instructive, the pictures, coloured and otherwise, should prove a great attraction. Some of the plates are reproduced from European journals, others are prepared by Japanese artists. Amongst other things we notice a coloured illustration of a double Ipomœa similar to those mentioned in Mr. JAMES VEITCH'S letters from Japan. These are evidently highly ornamental, and it is rather remarkable that they should be so little known in this country.

EASTER DUDDINGSTON.—We are in receipt from Mr. M. CHAPMAN of a *Catalogue of the Plants at Easter Duddingston Lodge Garden*, the property of the late CHARLES JENNER, Esq. This pamphlet, which is intended for private circulation, extends to nearly seventy pages, and is a carefully-compiled and interesting record of a miscellaneous horticultural collection. The botanical name, family, popular name, and native country of each of the 4000 species included are mentioned, thus furnishing something more than a mere list of plants, and also supplying evidence of the importance of the collection, and of the care taken to ensure correctness of nomenclature.

COTTAGE GARDENING, edited by W. ROBINSON.—We have before us the third volume of this useful periodical devoted to "poultry, bees, allotments, food, and house, window, and town gardens." It is published by Messrs. CASSELL at one half-penny a week. No one can say it is not worth the money!

ARISTOLOCHIA GIGAS.—A plant of this rare species from Guatemala is at the present time in bloom in Sir W. HENDERSON'S hot-house at Devanha House, Aberdeen. The flowers measure about 10 inches in width, and in total length nearly 3 feet.

FLOWERS AND PLANTS EMPLOYED AT A BALL.—On the occasion of Mrs. MILLER MUNDY'S ball, given at her residence, 20, St. James's Square, on the 13th inst., the rooms were profusely decorated with choice exotics, especially Orchids, every nook and corner being filled with them. Most of these plants, &c., came from Mr. MUNDY'S gardens at Shipley Hall, Derby; amongst them were some very fine spathes of Anthurium Scherzerianum. Hundreds of pounds' worth of Orchid bloom were displayed in nearly every conceivable position. The mantel-pieces were covered with plants of Adiantum Farleyense, intermixed with sprays of Odontoglossum crispum with flowers to the number of 1400. Large Palms formed a graceful canopy to the lowly-flowering plants. The general decorations on this occasion were entrusted to Messrs. WILLS & SEGAR, of South Kensington.

"NATURE NOTES."—This magazine, the organ of the Selborne Society, and edited by JAMES BRITTEN, F.L.S., contains, in the issue for July, much interesting information on natural history subjects. In the first article, by Mr. O. V. APLIN, on "The British Air Fauna: its Changes and Present Character," the author speaks of the various species of birds "lost" during the past few years. Mr. APLIN takes a more hopeful view of his subject than do some authorities (Mr. HUDSON, for instance, whose book on *Lost British Birds* forms the foundation of this paper), reporting that many species considered to be extinct still exist, and are to be found by those who know where to look, and that the disappearance of others is due less to wanton destruction by keepers, collectors, &c., than to changes in the nature of the country owing to drainage and climatic variations. The other contents of the magazine before us include articles entitled "Gilbert White in Sussex" and "In Arcadia," some book notices, and reports and announcements connected with the Selborne Society.

ROYAL BELGIAN HORTICULTURAL, BOTANICAL, AND AGRICULTURAL SOCIETY.—On the occasion of the monthly meeting of the above, on Friday, the 6th inst., Certificates of Merit were awarded to Begonia Madame Charrat (corallina × coccinea), and to Hydrangea stellata fl. roseo-pleno, shown by F. M. DESBOIS; to Cypripedium hybrid (Spicerianum × Stonei), and to C. nitidissimum (caudatum Warscewiczi × conchiferum), shown by M. ED. PYNAERT; to Pteris serrulata gracilis, shown by MM. DURIEZ BROS.; and to Begonia Président O. Bruneel ×, shown by M. TRAUGOT SZEWCZICK. A Certificate of Merit for progress in the culture of Azalea indica was given for three Azalea indica grafted on Rhododendron Cunninghamii, shown by M. T. J. SEIDEL, Dresden.

THE PICKERING LODGE ORCHIDS.—The first day of the 2nd sale was not so well attended as the previous sale days, and the consequence was that prices generally did not rule so high. The best price of the day was obtained for Cattleya Mendeli var. Blunti, 100 guineas. Sobralia xantholeuca alba, in flower, 44 guineas; Cattleya Gaskelliana alba, in flower, 38 guineas; C. crispum superbum, a magnificent specimen, 52 guineas; Sobralia Lucasiana, a fine specimen, 46 guineas; several Odontoglossum vexillarium superbum, in flower, from 10 guineas upwards; Dendrobium Statterianum, 20 guineas; Cypripedium Veitchii, 15 guineas; and many lots from 3 guineas upwards. The plants were in fine condition.

COFFEE IN NYASSALAND.—Mr. H. H. JOHNSTON tells a wonderful story of the origin and growth of the Coffee plantations in Nyassaland. When, some sixteen years ago, Mr. BUCHANAN was going out to Central Africa as horticulturist to the Established Church of Scotland Mission, the curator of the Edinburgh Botanical Gardens presented him with a sickly little Coffee tree. This tree reached the Shiré Highlands alive, and being planted at Blantyre throve mightily, flowered, bore fruit, and became the parent tree of the five millions which are now producing thousands of pounds' worth of berries. The mother tree, Mr. JOHNSTON says, is still living in the gardens of the Scotch Mission at Blantyre. *The Westminster Gazette.*

THE NATURAL HISTORY OF PLANTS.—The third part of the *Natural History of Plants*, Kerner and Oliver (Blackie & Son, London), includes chapters on the absorption of rain and dew by the leaves; symbiosis; changes in the soil incident to the nutrition of plants; the action of plants on the soil; the mechanical changes effected in the ground by plants; conduction of food; capillarity and root-pressure; transpiration; prevention of excessive transpiration; protective arrangements on the epidermis; form and position of the transpiring leaves and branches. As we have said when noticing other parts these subjects are dealt with in an attractive style, without sacrifice of accuracy. Even botanists, will find much that is new to them. How many keen-eyed plant-collectors, we wonder, know the meaning of the ridges of white hairs which pass down the stem of the common Chickweed, first on one side and at the next node shifting to the other side?

BEGONIA, BEAUTY OF EYNSFORD.—Mr. CANNELL sends us a flower of a very handsome double Begonia under this name. It is more than 4 inches across, of a pale yellowish buff colour, the petals of good substance, and rather deeply scalloped at the edges.

MR. W. H. GOWER.—It is proposed to present a "complimentary testimonial" to Mr. W. H. GOWER, long known as a student and trustworthy writer on the culture of Orchids, Ferns, and other plants. An influential committee has been formed for the purpose of carrying out the project, Messrs. PROTHEROE & MORRIS, 67, Cheapside, being the treasurers, and Mr. JAS. SEEGER, West Norwood, the secretary.

DEVON AND EXETER GARDENERS' ASSOCIATION.—The third summer outing of the members of the above took place on Wednesday, the 11th inst. The places selected for the day's outing were Haldon House, Whiteway House, Pitt House, and Teignmouth. At Haldon, the residence of T. B. BOLITHO, M.P., the party were enabled to view the many fine specimens of indigenous and exotic trees in the grounds and gardens. At the Dowager Countess of MORLEY'S residence, Whiteway, the party was invited to lunch, afterwards making a tour of the gardens, which is rich in Conifers, Magnolias, Japanese Bamboos, and inspecting the "goyle," or wild garden—a very interesting spot. The other places mentioned having been visited, and their beauties in tree, shrub, and flower duly noted and admired, the party, after dining at Teignmouth, returned to Exeter, which was reached about midnight.

HORTICULTURAL SHOW AT CLIFTON ZOOLOGICAL GARDENS, BRISTOL.—Favoured with fine weather and a large number of exhibits, the flower show promoted by the Bristol, Clifton, and West of England Zoological Society, and opened at the gardens on July 5, was not lacking in attractiveness. There was a large attendance throughout the day, and although the society's aim is to establish an attractive horticultural exhibition rather than to increase their revenue, the latter is a result which may be expected if the reputation of the show is kept up to the high standard attained this year. As compared with the previous exhibition, the entries were seventy-three in excess, being the largest number which the society have obtained, and some well-known exhibitors were to be found on the list. In point of quality the show was the best held at the gardens, and it compares very favourably with those of more mature growth.

SHIRLEY AND SURROUNDING DISTRICTS GARDENERS' AND AMATEURS' MUTUAL IMPROVEMENT ASSOCIATION.—A meeting of the above was held at Shirley on the 16th inst., Mr. B. LADHAMS presiding. An instructive paper on the "Cultivation of the Carnation and Picotee" was read by Mr. F. NUTT, Southampton, well-known amongst Carnation-fanciers as a successful amateur cultivator and exhibitor. Mr. Nutt staged a fine group of plants and cut blooms to illustrate his lecture. Mr. G. Rebbeck, Mr. Green, and Mr. B. Ladhams showed cut blooms of new and old varieties of the Carnation. A hearty Vote of Thanks to Mr. Nutt for his instructive lecture, and to the various exhibitors, was given. The subject for next month will be a paper on the 'Vine' by Mr. W. Mitchell, gardener at Chilworth Manor.

THE NEILL PRIZE IN HORTICULTURE.—The Council of the Royal Scottish Horticultural Society at a meeting held on the 11th inst., unanimously awarded the Neill Prize in Horticulture to Mr. ALEXANDER KIRK, gardener to Mr. JOHN PATON, of Norwood, Alloa. The Council make an award under Dr. NEILL'S deed every second year, and with the medal goes a sum of about £30 in money. Mr. KIRK is well known as a very successful all-round horticulturist. He has been exhibiting for over twenty years at the Royal Caledonian Society's shows, as also at all the chief exhibitions in Scotland and England, and has won over 400 first prizes for fruits, flowers, and plants. One of his notable successes was at the last International show in Edinburgh, when he secured the chief honours for Grapes. *Scotsman.*

NEWCASTLE AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.—The monthly meeting of this Society was held on July 11 in the Wood Memorial Hall. There was an exceptionally good attendance, and Mr. P. COWAN, of South Shields, occupied the chair. There were about twenty-three different specimens on the table for identification, principally herbaceous perennials. After these had been satisfactorily disposed of, Mr. MURRAY, of Oakwood, read a very interesting paper on "Gardeners Past and Present, and their Relation to other Trades." A discussion followed of an interesting character.

AMATEUR'S COLUMN.

CORNUS CAPITATA (WALL.), BENTHAMIA FRAGIFERA.—This has flowered for the first time in the twenty-five years I have had it. The flowers are yellowish-white, and about 2 inches in diameter. The bush is about 15 feet high, and as much in diameter.

ROMNEYA COULTERI.—This is now in full flower in the open air, having survived the exceptionally hard frost (19° of frost) of last January. The spreading petals of the deliciously-fragrant white flowers are 7 inches in diameter. The above recorded temperature was the lowest here since 1879.

EUCALYPTUS SPECIES.—Of these E. globulus has been killed to the ground, but is throwing up from the root. E. viminalis has been killed back to the trunk, but is sending out shoots from this. E. coriacea has had its leaves injured, but nothing more. E. coccifera is untouched. All but the last are from ten to fifteen years old, and have never been protected. E. globulus and E. viminalis were 33 feet high.

THE SEASON.—We had no frost worth mentioning in May, the lowest recorded in the Stevenson screen being 31°.2 on May 22; but we had sleet and hail on May 19, and I attribute the bad crop of Apples to this.

WASPS.—Queens, which were abundant in May and early June, seem to have quite disappeared. I have not seen one for some weeks. *A. O. W., Colwyn Bay.*

HOME CORRESPONDENCE.

CYPRIPEDIUM SPECTABILE.—I enclose some flowers of Cypripedium spectabile taken from plants growing in the natural soil, which is light. They get no protection in the winter, and are in a rather exposed situation. They flower splendidly every year, and the clumps have increased considerably during the last three years. C. calceolus and C. purpureum are growing in the same bed, and are also thriving and flowering well. *Wm. Barlas, Athole Hydropathie, Titlochy, N.B., July 5.* [The flowers sent were good and strong, and the foliage very healthy and vigorous. ED.]

THE FOOD REQUIREMENTS OF THE CHRYSANTHEMUM.—In reply to my question, viz., food requirements of the Chrysanthemum, *Gardeners' Chronicle*, p. 45, the writer still thinks the artificial manure that he recommended is in accordance with the analysis of the Chrysanthemum ash. Now, if nitrate of potash and magnesia were given in equal proportions (100 parts of both), we should be applying 47 parts of potash to 100 parts of magnesia, because there is only 47 per cent. of potash in 100 parts of potassium-nitrate, and as we are told to take two parts of magnesia to one part of nitrate of potash, we are giving magnesia in the proportion of 4 to 1. The writer pointed out that most soils used for growing Chrysanthemums contained 1 per cent. of potash; but why omit the other ingredients, which are equally as valuable as the potash? An analysis I have before me contains the following important plant foods:—Potash, 1 per cent.; soda, 2 per cent.; lime, 4 per cent.; iron, 8 per cent.; phosphoric acid, .50 per cent.; this shows at once that potash, soda, and lime are present in about equal proportions, iron in excess, and a small percentage of phosphoric acid. A fair-sized plant could be grown in a 10-inch pot filled with this soil, without the addition of any artificial manure. Now, if we look at these facts we can see that the soil contains the necessary constituents for plant-growth to a certain stage, and as the phosphoric acid present in the soil is in the least proportion, we will work out what manure we should apply from that: now, if we take 20 ounces of kainite, 25 ounces of basic slag, and 30 ounces of bone-dust, mixing these with 120 lb. of soil, we should apply part of the plant food in a way in which it would become slowly available to the plant as long as it was needed. But the above would not contain all the ingredients necessary for the full development of the plant, so we mix together 8 ounces of magnesia, 16 ounces of nitrate of soda, and 26 ounces of nitrate of potash; if this was mixed with about 5 times its weight of fine soil, and a little sprinkled over the top of the pot every week, so that the above-mentioned quantity would last ten plants in 10-inch pots the whole of their growing-season. I think we should be then giving the plant its proper food, and in the needed proportions the last-named mixture could also be dissolved in water, ¼ oz. to 2 galls. of water, and the plants watered with it every week. This way I do not approve of, as a quantity of the more soluble may be lost by careless watering.

Constituents.	Percentages. Ash of the Chrysanthemum.	Manure as above.	Recommended Manures. No. 1.	Recommended Manures. No. 2.
Potash	16¼	14½	4½	7½
Soda	10½	8½	9	15

I have written above the Ash analysis of the Chrysanthemum, the analysis of my manure, and the two classes of manures as recommended by the writer. *W. Dyke, Turnford, Herts.*

LILIUM HORSMANNI.—It is a pity that Lily names should be needlessly multiplied. The Lily shown and certificated on the 10th inst. at the Royal Horticultural Society's meeting as L. Horsmanni, is identical with that which came over to this country in quantity some years ago from Japan. I believe that at the sale they were called Thunbergianum cruentum (elegans cruentum is the name in our garden book). We grew a quantity of them; some still survive, and are much admired. Mr. Lynch, of the Cambridge Botanic Gardens, was at Oakwood two days after the Drill Hall meeting, when he saw L. e. cruentum in flower, and he agreed with me that it was identical with the one exhibited, and that the error should be pointed out. I do not know whether this species of Lily has ever been certificated as L. elegans or Thunbergianum cruentum, or atro rubrum. I think it is worth a certificate, but it should have its proper name. *George F. Wilson.* [L. Thunbergianum cruentum was certificated July 11, 1882. ED.]

NYMPHÆAS.—Latour Marliac's Nymphæas are lovely here now in our cold-water pond in the open air white, rose, peach, crimson, and yellow. Some of the Marliacea forms, such as carnea, exquisita, and chromatella are large and fine. N. odorata vars. smaller, and N. pygmæa smallest of all, with perfect little flowers each only as big as a florin. *F. W. B., Dublin.*

SCHIZANTHUS.—We have at present a splendid show of this beautiful decorative plant in the conservatory here; arranged amongst flowering double-flowered tuberous-rooted Begonias, and the effect is pleasing. For table decorations there are few flowers to excel it for lightness and grace. The cultivation is very similar to that followed with Mignonette, the seed being sown in March in 3-inch pots, and the seedlings thinned out to two or three. When in need of more space they are potted without disturbing the roots, into 6-inch pots for flowering. They require plenty of water, and also feeding with soot-water twice a week when established. The varieties grown are pinnatus roseus, Hookerii, and others. *G. Burrows, Warwick College.*

THE ROYAL HORTICULTURAL SOCIETY'S PROPOSED FRUIT SHOW AT THE CRYSTAL PALACE.—On the 4th instant I received a copy of the schedule of the great exhibition of British-grown fruits to be held at the Crystal Palace on September 29 and three following days, Sunday intervening. And at p. 3 under the heading of notes on the schedule, which "all intending exhibitors are requested to read carefully, as the interpretation of the schedule will be governed by them," and in Clause IV., it is stated that Grapes should be exhibited on inclined stands, covered with white paper, of a uniform breadth from front to back of 14 inches, depth at back 10 inches, and depth at front 2 inches. According to this, both black and white Grapes are to be shown on boards covered with white paper, and exhibitors already provided with Grape stands and boxes are, if they wish to stage fruit at the above-mentioned place, expected to put themselves to the expense of having new boards and boxes made, and, moreover, to reduce the dimensions of some of their bunches of Grapes in order to place them on the boards specified by the Royal Horticultural Society. Will Grape growers who are accustomed to stage Grapes at the Crystal Palace and other important fruit shows throughout the country do this? I think not. It would be interesting to know what specimens of Grape culture the committee of the Royal Horticultural Society had in their minds when determining the dimensions of the Grape-boards in question; they are too small, too flat, having an angle of only about 22°, and not of the right shape for Grapes travelling safely on in boxes. I certainly like to see Grapes staged on boards of uniform breadth and depth, where it can practically be done without unnecessarily increasing the size and weight of exhibitors' boxes, and consequently travelling expenses in the way of excess luggage by having all stands and boxes made large enough to hold bunches of Gros Guillaume, Trebbiano, and other large bunch varieties of Grapes. I think it would have been wise, not to say courteous, on the part of the Royal Horticultural Society, to have consulted fruit growers who are in the habit of showing Grapes, &c., regularly at the Crystal Palace shows on the matter before actually framing clause iv., p. 3. *An Old Exhibitor.*

—— I notice on page 3, par. v., in the schedule of prizes of the forthcoming fruit show of the Royal Horticultural Society, the words "kind" and "variety," are stated to be used in the following sense, Peaches, Nectarines, Apples, Plums, are distinct "kinds" of fruit (quite right); Royal George, Noblesse, Alexander, are distinct "varieties" of Peaches (this is also right). But in turning over the leaf I was surprised to find at page 5, class I., "Collection of Ripe Fruit, 15 distinct varieties, to include 2 varieties of Melons, and a dish each of the following:—Black Grapes, white Grapes, white or yellow Plums, red or black Plums, Peaches, Nectarines, Apples, Pears, and 5 other dishes of other kinds of fruit, or of distinct varieties." This is certainly contradictory, and is not likely to enlighten young exhibitors as to the real composition of the collection of "fifteen distinct varieties of fruit" to be staged for the prizes mentioned in class 1. Although not so stated, I should say that those who framed the schedule meant "fifteen dishes of fruit, to include two varieties of Melons, black and white Grapes (presumedly three bunches of each), two dishes of Plums, distinct varieties; Peaches, Nectarines, Apples, Pears, one dish of each, and five other distinct kinds of fruit; such as Pine-apple, Apricots, Cherries, Figs, and Gooseberries." *Pro Bono Publico.*

EREMURUS ROBUSTUS.—In answer to your correspondent regarding the seeding of Eremurus robustus in this country, I wish to state that a plant here threw up a splendid flower-spike this summer, and it now has twenty-two seed-vessels, all of them

near to the top of the spike. These will, I think, give good seed; they increase in size very fast indeed, and are now of the size of ordinary Peach stones. The foliage was much damaged by frosts in May, although it was slightly protected by a few sprays of Yew. *A. S., Round Oak Gardens, Englefield Green.*

DISEASES OF THE GRAPE-VINE.—I.

Downy mildew of the Americans (Plasmopara viticola, Bert. and de Toni), a fungus closely related to the one causing Potato disease, has been known

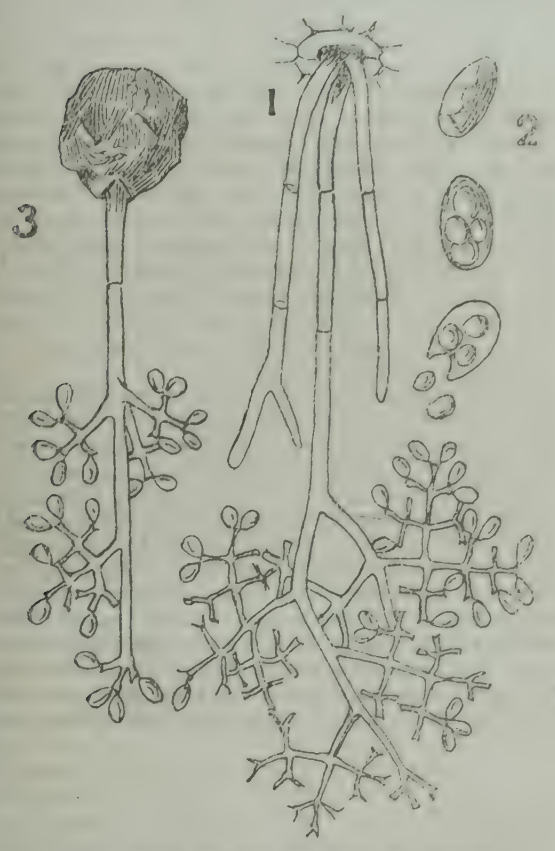

Fig. 12.—Downy mildew (Plasmopara viticola)

1, Group of conidiophores bearing conidia, issuing from a stoma on the under side of a Vine-leaf; 2, Conidia, showing the formation of zoospores; 3, an oospore, germinating and producing a branch bearing conidia. All highly magnified.

for a long time as a destructive parasite of the Grape-vine in the United States, and its occurrence during the present season at several distant centres, proves that it is established amongst us.

In its most usual form, the fungus attacks the foliage, the first indication of its presence being the appearance of pale green or yellowish spots on the upper surface of the leaf; corresponding to these spots, the fungus appears on the under-surface of the leaf in the form of white minutely-downy patches. As the disease develops, the patches on the upper surface become brown, and frequently run into each other, until finally the entire leaf shrivels as if scorched, and becomes very brittle.

Where Vines are grown on a small scale, as in this country, and where there is every facility for examining every portion of the plant, a severe attack of downy mildew can only be attributed to negligence or indifference on the part of the cultivator when once the very characteristic indications of its presence are grasped. The small, scattered, yellowish spots on the upper surface of the leaf clearly indicate the presence of the spawn of the fungus in the tissues of the leaf, where it remains concealed for some time, living and increasing in size, feeding on the substances prepared by the plant for its own use. If infected leaves are removed and burnt at this stage, the spread of the disease is checked; and furthermore, the mycelium or spawn is prevented passing from the leaf into the young shoots, where it may possibly remain until the following year, when it will break out again.

The downy patches on the under-surface of the leaves, consist of numerous-branched fruit-bearing stems — conidiophores, each branchlet bearing a minute fruit conidium at its tip. This is the asexual mode of reproduction, its object being to enable the fungus to distribute itself rapidly. These conidia grow very quickly, are produced in immense numbers, and germinate at once. When ripe, the conidia fall away from their support, and if they fall on the damp surface of a Vine-leaf, certain changes take place that need not be entered into here, but within two hours germination has taken place, the young mycelium pierces the epidermis of the leaf, and a new centre of disease, which rapidly gives origin to more conidia, is then established.

From the above account, it will be seen how important it is to arrest the progress of the disease before the conidia are produced—a thing not very difficult to accomplish where in many instances not more than half a dozen plants have to be dealt with. On the other hand, it shows the great difficulty of successfully preventing the spread of disease when once the conidia are formed; for example, spraying or syringing with water is doing an act of kindness to the fungus by carrying the conidia to healthy leaves and supplying them with the required amount of moisture for germination. Where the fungus has gained a foothold, spraying with the following solution has proved effective: i.e., one pound of pure sulphate of copper dissolved in 40 gallons of water. The spraying should be done in the evening, if done in the morning the leaves are apt to scorch. As a preventive, where the presence of the fungus is suspected, two or three applications of the above mixture are recommended, commencing before the Vines bloom.

In conclusion, it may be mentioned that the downy mildew has a second sexually-produced form of fruit, formed on the mycelium within the leaf late in the season, after the formation of the external form; the object of this second kind of fruit is to tide the fungus over the winter season; the so-called oospores remain in the dead tissues of the leaf until spring, when they germinate and produce conidia which find their way on to the young leaves of the Vine, and thus commence a new cycle of development. It will be gleaned from the above how important it is to remove and burn fallen leaves and fruit that are diseased; or as the cultivator is not supposed to know which are diseased, burn all. Perhaps at some future time, employers will consider it part of a gardener's duty to be acquainted with the symptoms and broad outlines of the diseases of plants he is expected to cultivate successfully.

As already stated, the typical form of downy mildew is confined to the foliage; but a second form, known as "brown rot" in the United States, appears to be more prevalent in this country than the typical form. The peculiarity of brown rot consists in the fact that it attacks the fruit of the Vine, and its characters are very marked, so that it can be readily distinguished from black rot and other forms of disease attacking the fruit. When the fruit is about half grown, a brown stain appears at the point of junction of stalk and fruit, the brown colour gradually extends over the whole of the fruit, but the skin remains perfectly smooth and unbroken, and there are no black points as in the black-rot. If the fruit is cut across, it will be seen that the pulp is also brown or chocolate colour; in fact, the inside of the fruit is brown before the colour shows itself outside. Microscopic examination of a diseased Grape shows the characteristic mycelium of Plasmopara viticola. As the disease progresses it shrivels, and finally its surface is covered with a crop of the conidia stage of the fungus.

The berries should be removed from the bunch on the first symptoms of disease, indicated by the appearance of a brown coloration, and all fallen diseased fruit should be destroyed. In all probability infection takes place when the plant is in bloom, and a sharp look-out should be kept for the presence of downy-mildew on the inflorescence and leaves. Spraying with the solution mentioned above, or with Bordeaux Mixture, checks the progress of the disease.—*G. Massee.* [In the case of the "spot," a second fungus, Glæosporium, sometimes makes its appearance on the berrier, as shown in a drawing by Mr. Worthington Smith at fig. 13. What relation,

Fig. 13.—Gl eosporium on grapes.

if any, exists between the two fungi is not known. "Spot" is apparently exceedingly common this year. Ed.]

IRELAND.

MARKREE CASTLE.

The rockery at this place was very gay in June, with the following really good things, which do well with us here in the west of Ireland, viz., Onosma taurica, a good strong plant of which is bearing upwards of thirty-five flowering growths, an effective plant, either on a rockery or in the borders; the plants may be increased by offshoots dibbled into sandy soil under a bell-glass the first week in September. Aster alpinus, when grown in quantity, and planted in groups of twelve or more plants, is also a telling plant. I am in favour of grouping plants rather than indiscriminately planting them singly: for one thing, there is not the liability of losing them by their being overgrown by robuster species; moreover, one or two labels are sufficient to mark the whereabouts of a group, instead of many in the case of scattered plants. Ramondia pyrenaica is another plant that does well on the shady side of the rockery, as it thrives in subdued

light and a moderately damp situation, and a crevice of a rock suits it admirably. Heuchera sanguinea thrives in our strong loam with plenty of grit mixed in it, or burnt earth may be substituted for it. This last-named material we use liberally on all seed-beds—in fact, in all places where porosity is required. In planting, we make it a rule to divide two-year-old plants into medium-sized pieces in September, the plants then becoming established before winter. A bell-glass is sufficient to protect Ramondia during the winter. I have a plant treated thus, bearing fourteen spikes at the present time. Dianthuses are lovely, especially D. neglectus, D. petræus, a profuse bloomer, and of a light graceful habit; whilst D. alpinus forms pretty cushions of beauty, and others, too, of the same genus are pretty, and very fragrant. Orchis foliosa grows in a dampish position, and is a very fine-flowering plant; and Cypripedium Calceolus does well in the same position, and is a noteworthy plant; C. spectabile is not yet in flower, but I notice it is making very strong growths.

Ulex hispanica is a fine subject for rockwork, and Eurybia Gunniana is an excellent companion; Genista procumbens is useful for trailing over the rocks, and we get a bright bit of colour in Philadelphus coronarius foliis aureis; it is about 14 inches high, and is a plant well adapted for planting on a rockery. Rubus australis is very curious, and an uncommon plant. In a peat-bed we have Azalea rosæflora; it is a gem, looking well also as an edging plant. A good companion to the last-named is Rhododendron hirsutum, a compact free-flowering plant with us; Vaccinium pennsylvanicum is pretty when in flower, and the foliage has lovely tints in the autumn. We possess plants of Romneya Coulteri which are in bud, and will be good later on.

Corylus purpurea is a beautiful hazel; and Clematis coccinea should be very largely grown. Echinacea purpurea has flower-buds, and later, a clump of a dozen plants will be very fine. Tropæolum polyphyllum is in flower, and a choice subject it is for trailing over rocks. Iris aurea is a good useful-flowering plant when you get it true to name. Erigeron aurantiacus var. purpurea is a fine-growing plant, and very much like Aster alpinus, only more vigorous, and a most profuse-flowering plant. The commoner one, Erigeron aurantiacus, is not to be despised, it being very effective when grown in a mass. I grow it from seed, and seedlings flower better with me than old plants. Polygonum sphærostachyon is a gem; and we have others too numerous to note at present. *Herbert May, Markree Castle Garden, Sligo.*

SCOTLAND.

NOTES FROM PERTHSHIRE.

Many of the readers of the *Gardeners' Chronicle* will have read from time to time of the remarkably fine Grapes grown by Mr. Leslie, the gardener to Mr. Coates, at Pitcullen House. It often happens that winners of prizes for Grapes crop their Vines lightly, but it is not generally the rule so to do in Scotland, where many of the most successful men, and Mr. Leslie is one of them! take heavy crops every year.

Climbing the hill to the gardens, the visitor obtains some beautiful views over the city of Perth, and across the wooded lands of Strathearn. The position of this elevated garden is favourable to the cultivation of fruits under glass, if less so to those out-of-doors. Strawberries, however, seem to do capitally, Duke of Edinburgh and Garibaldi being the favourite varieties. Passing through a long span-roofed house filled with Tomato plants at the front, back, and along the centre, I noted their promising condition, and a variety was noted which appears to be an acquisition, Early Essex. It came from Boston, U.S.A., and like many other American varieties it is of strong constitution, prolific, and of fine quality. Another house visited was filled with Melons, French Beans, Begonias, Chrysanthemums, all looking as promising as could be wished. In Peach-houses, Royal George, Noblesse, and Late Admirable, were noted varieties, which will furnish the principal supplies. These are varieties that are still commonly planted in Perthshire, succeeding capitally in most gardens. Nectarines are well managed, and the fruit is grandly flavoured, especially Victoria, a great favourite at Pitcullen.

In a small vinery I remarked some compact, well-shaped bunches of Appley Towers Grape, its compactness seeming to suggest its finding favour with packers. Other vineries were filled with vigorous Vines, which are allowed to make plenty of strong foliage, although crowding is guarded against. The black Hamburghs are planted in inside borders, but the roots can pass out to a capital border; and excessive feeding is no part of Mr. Leslie's management of the Vine. Exhibitors at Edinburgh are likely to see these Grapes. A house full of Black Alicante is entered, and fine bunches of large well-coloured berries are noted; Gros Colmar in another vinery could scarcely be surpassed for excellence in every respect; the foliage of great size, and bunches large and of fine form. The Muscat vinery was a picture of high-class culture, and in this vinery the vines of Duke of Buccleuch are as fruitful, and doing excellently; Mrs. Pince gets a good share of attention. *M. Temple.*

(To be continued.)

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

July 10.—Present: Dr. D. Morris, C.M.G., in the chair; Mr. McLachlan, Mr. Blandford, Dr. Russell, Professor Müller, Mr. Wilson, and Rev. G. Henslow, Hon. Sec.

Calochortus, vars.—Mr. Wilson exhibited specimens remarkable for their fine growth and varieties of colouring. They were C. venustus, purpurascens, C. v. roseus, and a pure white form. References to descriptions and figures of C. venustus, Benth., a native of California, will be found in Baker's "Revision of the Genera and Species of Tulipeæ," *Journ. Lin. Soc.*, xiv., p. 302. Mr. Wilson observed that this species was drawn by Mrs. Duffield about twenty-five years ago, and reproduced in the *Garden*. It is also figured in *Trans. Hort. Soc.*, ii. (1) [1835], t. 15, fig. 3. Mr. Baker places Calochortus as the sixth and last genus of the tribe Tulipeæ, enumerating twenty-one species from Mexico and Western North America.

Sugar-cane Diseased.—Mr. Blandford reported on specimens received from Barbados. They were badly diseased with the fungus, Trichosphæria sacchari, and in some cases bored by the beetle Sphenophorus. This disease is as yet only known to occur in Mauritius, Java, and Barbados. Dr. Morris observed that it first appeared in Barbados, and was called the "rind" disease; it then occurred in the roots in Java, being thought to be distinct from the former; but the two forms ultimately proved to be one and the same. A summary of the nature of the disease is contained in a letter to the Colonial Office, *Kew Bulletin*, June, 1894, pp. 175, 176.

Photos of Malta.—Mr. Henslow exhibited some photographs illustrative of different features of Malta, including cultivated areas, uncultivated hill-tops, &c., and ancient river valleys known as "wieds." The only trees of cultivation in the fields are Carobs, Figs, Opuntia, Ficus indica, of which last there are four varieties—the "blood," the "white," the "seedless," and the "yellow."

Oxalis cernua, Thunb.—He also showed specimens of this ubiquitous and so-called by the Maltese "English weed," introduced by Father Giacintho from the Cape in 1806. It is remarkable for its prolific multiplication by bulbils, as it never sets seed in the northern hemisphere, the "short-styled" form being the only form known. It has elongated slender rhizomes, with rod-like aquiferous appendages, by means of which it can climb up among the loose stones of the walls, or descend to great depths among the rubble. A further account of the distribution of this plant throughout the Mediterranean region, having originated in Malta, will be found in the *Proc. Lin. Soc.*, 1893, p. 31.

Centaurea spathulata Zeraph, 1827 (*C. crassifolia*, Bert., 1829).—Mr. Henslow also brought a living plant in flower of this remarkable species, which is the only truly indigenous plant known to Malta. It has entire spathulate fleshy leaves, and heads of rose-coloured florets. It is found in the valley known as "Wied Babu," in Malta, and also in Gozo, growing in the cracks of the rocks.

Fruit Committee.

July 13.—The following members of the Fruit Committee, viz., Messrs. Balderson (chairman), J. Smith, Norman, Wythes, Bates, Hudson, Pearson, J. Wright, Glen, A. Dean, and A. F. Barron, Secretary, met at the Chiswick Gardens, on the above date.

Attention was first given to the large collection of Tomato plants in pots. These were standing on either side of the broad footway in the large span-house, and were all more or less in fruit, some carrying capital crops. The earlier clusters were quite ripe. There were none of very special merit, as Tomatos now seem to have got to their best, both in productiveness, and excellence, and beauty of the fruit. The following new and old varieties received three marks, viz., Golden Princess, large yellow; Golden Nugget, and Sutton's Dessert, both great fruiters, and singularly fitted for dessert purposes; Comet (Wrench), medium size, red, very free; Excelsior (Corbett), a free handsome medium-sized red; and Conference, still one of the best and most prolific. The following had at present two marks:—Sutton's A 1, Brookes' Freedom, smooth round, and Turner's Prolific, a large red variety that is a good cropper. The Tomatos may be seen again later after the present green fruits have ripened.

The committee then adjourned to the Pea quarter, where, under a heavy downpour of rain, the duty of determining which seemed to be the best out of a very large collection of new and old varieties was proceeded with. The Peas were not in an entirely satisfactory condition. The supports provided were far from being so new and good as is essential to the proper conduct of a trial of this nature, and it is to be hoped the Chiswick Board will next year be able to provide an ample supply of fresh sprays. Then, the great heat which interposed between the previous and recent rains had severely checked bloom and pod-forming. In spite of these defects, however, the result was in most cases better than could well have been anticipated.

It is most obvious, however, that progress in raising Peas is very slow, indeed, so much so, that very few new ones show any advance whatever on the best standard varieties. The following, hitherto unmarked, were selected after great attention:—For three marks: Mr. Eckford's The Don, tall fine pods; Veitch's 365, 4 feet, very good, and which it was suggested, because of its number, should be named All the Year Round; Hughes' Fertility, 4 feet, very prolific; Laxton's J. Howard, a capital Pea of the Ne Plus Ultra type; and Eckford's Critic, a tall fine variety. Some of the new varieties certainly need more selecting before being sent to Chiswick, and it would be well if not a few of the existing varieties were withdrawn from commerce altogether.

WIMBLEDON HORTICULTURAL.

July 11.—The twenty-second annual exhibition of this society took place on the above date, and though not so large as some of its predecessors, was on the whole a fairly good display.

For a group of miscellaneous foliage and flowering plants, to cover 60 square feet, the premier position was won by Mr. J. Law, gr. to R. Dean, Esq., The Priory, with a beautiful arrangement.

In the 40-feet groups, the 1st prize was secured by Mr. T. Chandler, gr. to Rev. Canon Haysgarth, The Vicarage, having a tastefully-arranged collection; 2nd, Mr. W. Stokes, gr. to R. W. Milnes, Esq., Cottenham Park—a good display.

Six miscellaneous foliage or flowering plants.—1st, Mr. H. Alderman, gr. to G. Hatfeild, Esq., Morden Hall; here was a fine specimen of Alocasia macrorhiza variegata.

Mr. Hutton, gr. to G. E. Frere, Esq., was well to the front with four stove and greenhouse plants, his Allamanda being a finely-flowered example.

Mr. Methven was 1st for four exotic Ferns, his best specimens were Davallia Mooreana, and Asplenium nidus; 2nd, Mr. G. Hutton, whohad a good lot of plants. In Lycopods the honours were divided between Mr. C. Bentley, gr. to Captain Bosworth, and Mr. G. Hutton.

Four fine plants of Caladiums gained for Mr. J. Law a 1st prize; and six specimen Coleus, some ex-

tremely well-grown and coloured plants came from Mr. C. Bentley, also gaining 1st prize.

Fuchsias were well shown by Mr. H. Mills, gr. to E. D. Carver, Esq., and Mr. W. Thornton, gr. to T. E. Crocker, Esq.

Six Gloxinias very freely-flowered plants, gained Mr. C. Bentley 1st prize; and Mr. G. Hutton, 2nd.

Zonal Pelargoniums gave some bright patches of colour, and for twelve specimens Mr. J. Law was 1st; and Mr. T. Chandler for six specimens.

The best twelve and six table plants were shown by Mr. H. Alderman.

Mr. James Bateman, Archway Road, Highgate, had the best twenty-four cut blooms of the Rose, with a well-selected lot of varieties.

Mr. A. Newell, gr. to Sir E. Saunders, took 1st prize for collection of hardy herbaceous flowers in fresh condition and great variety; 2nd, Mr. J. Law, with a good assortment. Bouquets, &c, were well shown by Messrs. Nowell, Chandler, and Lowe.

The 1st prize for a collection of fruits was gained by Mr. H. Alderman. His kinds being Black Hamburgh Grapes, Unser Fritz Strawberries, and Grosse Mignonne Peaches, being especially good. A very creditable exhibit came from Mr. C. Bentley.

Numerous small dishes of Grapes, Peaches, and Nectarines were exhibited besides vegetables, some of which were shown in the nurserymen's competition, the others being the society's prizes.

FINCHLEY HORTICULTURAL.

July 12.—This flourishing society held its thirty-fourth annual exhibition on the above date, in the grounds of W. P. Jones, Esq, Manor House, Finchley, and the committee have every reason to be satisfied with the result of their labours. A large number of persons visited the show in the evening.

Among the most noticeable of the exhibits may be mentioned the Grapes shown by Mr. H. A. Page, gr. to F. Crisp, Esq, Southgate; and some very beautiful Roses by Rivers Langton, Esq., Hendon; while Mr. D. Hayler, gr. to W. Hannaford, Esq., Hendon, secured five 1st prizes for bouquet, table decorations, Roses, &c. Some very fine specimen plants, both flowering and foliage, were shown by Mr. Easton, gr. to Mr. B. Noakes, Highgate.

The cottagers and allotment-holders had a tent to themselves, and staged such a good assortment of fruit, flowers, and vegetables, that the opinion was freely expressed, that in some classes they beat the professional gardeners.

Messrs. Cutbush & Sons, Highgate, and Messrs. Cuthbert & Son, Southgate, each sent a large group of plants, cut flowers, &c, not for competition.

NEWCASTLE-ON-TYNE.

July 18, 19, 20.—As last season, this year's exhibition was held in the Recreation Ground, North Road, a splendid roomy, open area. The Council of the Newcastle-on-Tyne Horticultural Society this season decided to add other attractions, after the manner so successfully adopted at Shrewsbury. They wisely commenced in a moderate way for the first time, so as to, in a measure, feel their way. Catering, as they do, for the large population of this flourishing centre, it is to be hoped that the result of their endeavours will be all that they could wish. The one regretable feature on the opening day was the stormy and variable weather that prevailed. The show was in every respect an excellent one, there being in nearly every case a keen competition.

Plants.

Stove and greenhouse flowering were, as usual, at this show staged in splendid condition. Mr. Letts, gr. to the Marquis of Zetland, Aske, Yorks, was a grand 1st for eight varieties, showing in his best style. He had two immense plants of Anthurium Scherzerianum, both covered with spathes—that called Shuttleworth's var. being particularly bright in colour; Dipladenia amabilis was one mass of flower and highly coloured, the plant extra large; Phenocoma prolifera Barnesi was also fine, being covered with bloom, more than usually so; Erica Denisoniana, a light variety of the hard-wooded section, was similarly good and fresh; Azalea Souvenir de Prince Albert had been kept very fresh, being one mass of flower; another splendid plant was Darwinia macrostegia, bearing its flowers in the greatest profusion, and of high colour; Clerodendron Balfourianum also made a good display. Mr. Morris, Park Road, Felling, who followed in this class, had a good example of Ixora salicifolia amongst others.

Mr. Nicholas, gr. to the Marquis of Zetland, at Upleatham, easily won the 1st prize for six plants in bloom; these, as in the other case, were extra fine; Dipladenia boliviensis was very striking, being both large and freely bloomed; D. Thomas Speed, after D. amabilis, was a good companion to it; Anthurium Scherzerianum was an extra vigorous example; Erica depressa, a large specimen, clothed with its yellow flowers, and still quite fresh; Ixora Pilgrimii bore a profusion of large trusses; Erica ventricosa Bothwelliana was a comparatively weak plant, being thin, and none too fresh; Mr. Wylam, Cramlington, who was 2nd, had a capital plant of Rondeletia speciosa major.

Mr. John McIntyre, gr. to Mrs. Gurney Pease, Darlington, was 1st for a group, covering 200 square feet, quite easily, with a very light and informal arrangement, in which Bambusa gracilis, Cocos plumosus, Crotons and Dracænas of good colour, were conspicuous features as foliage plants, with Anthuriums, Lilies, Amaryllis, &c., as flowering examples. Mr. Allen, Blandford Street, Newcastle, who was 2nd, had well-grown plants arranged in a too flat and formal manner.

Mr. Letts won again and quite easily with eight fine foliage plants, the best amongst which was Cordyline indivisa, in fine health, a finer example than which is rarely seen; Crotons Queen Victoria and Chelsoni were both large and finely coloured; Cycas circinalis, a dense mass of fronds; Kentia Belmoriana, of large size; Encephalartos villosus, bearing a fine cone and healthy foliage; and a Dasylirion acrotrichum, a perfect specimen. Mr. McIntyre, who was 2nd, was not in nearly so good form in this class; but he won the 1st prize against Mr. Nicholas for six varieties with a well-managed lot, comprising two good Crotons, Croton Andreanus and C. angustifolius, with a large Cycad. Mr. Nicholas, who followed, had Dasylirion acrotrichum as his best plant.

The best half-dozen Ferns were those from Mr. Nicholas, who staged Gleichenia Mendeli and G. rupestris glaucescens, in fine style; Sadleria cyathoides, a comparatively rare but fine Tree Fern, bore eleven fronds, being fully 6 feet in height; Davallia fijiensis plumosus was an immense mass of grandly-developed fronds; D. tenuifolia Veitchiana was also good, and so was Leucostegia immersa, which is worthy of extended culture. Mr. McIntyre, who was beaten in this class, had Davallia fijiensis plumosa and D. Mooreana, both being large and fine specimens. The last-named was 1st, however, in another class for smaller plants, with good examples.

Mr. Letts was 1st for three Crotons, with well-coloured, medium-sized specimens of C. Queen Victoria, C. Thompsoni (extra good), and C. Aigburthiensis.

Mr. McIntyre was 1st for three Dracænas, with dwarf clean plants of good colour; 2nd, Mr. Stewart, gr. to Sir Wilfrid Lawson, Brayton—very close.

The best tuberous Begonias were from Mr. W. Pitt, Woolsington Hall (C. L. Bell, Esq.), well grown, but old kinds. Mr. Nicholas showed four nice dwarf plants of Ericas, and easily won; these were E. Massoni major, now rarely seen, being well flowered, and very healthy; E. retorta major, E. Ne Plus Ultra, and E. Austiniana, being each similarly good, and all quite fresh and clean.

Table plants of useful size were shown in quantities, Mr. McIntyre being the most successful.

Cut Flowers.

Roses were, as usual at this northern show, remarkably good and fresh.

For forty-eight varieties, Messrs. Harkness & Sons, Bedale, succeeded in holding their own against Mr. G. Prince of Oxford, the former having the brighter and cleaner flowers, but scarcely so bulky; the finest were Ulrich Brunner, Auguste Rigotard, Gustave Piganeau, Black Prince, Victor Hugo, and Madame Gabrielle Luizet. Mr. Prince's best were Merveille de Lyon, Comtesse de Nadaillac, General Jacqueminot, and Marie Baumann. The last-named exhibitor succeeded in turning the tables on his opponents for thirty-six varieties in a close competition. Mr. Prince was also 1st for twelve blooms, any sort, one variety showing a fine stand of Prince Arthur, one of the very best dark Roses; the next best being a box of Madame John Laing, very fresh, but a trifle loose in petal, from Messrs. D. & W. Croll, Dundee.

The best twelve of any yellow variety were Marie Van Houtte, from the last-named exhibitors; but Mr. Prince was, however, invincible for twelve Teas, his best being Jean Ducher, Etoile de Lyon, Comtesse de Nadaillac, and Catherine Mermet, all of good quality; Messrs. Croll following with smaller flowers.

In the amateurs' division the Roses were also particularly fine, the most successful here being Mr. A. Robson, The Cemetery, Hexham, for twenty-four varieties very fresh and bright; and Mr. A. Whitton, Bedale, for twelve varieties, also good; the latter was also 1st for twelve Teas or Noisettes.

Hardy herbaceous cut-flowers were specially fine, notably so the two best collections, in which Messrs. Harkness again took the lead, having grand bunches, the best being Scabiosa caucasica, Eryngium amethystinum, Œnothera Youngii, and good kinds of Delphinium. Mr. Thos. Battensby, Blaydon, who was 2nd, had a fine lot also.

Flowers from the stove and greenhouse were best shown by Mr. Nicholas, who had 1st for 12 and for six bunches, in each case staging choice kinds. The best Pansies came from across the Border, Mr. A. Irvine, Kyles of Bute Nurseries, being 1st for both show and fancy kinds. For Carnations, Picotees, and Pinks, the local growers were the most successful. Mr. Flowdy, Sutherland Street, Gateshead, being 1st for Pinks and Carnations; Mr. W. Archer, Sunderland, 1st, for Picotees.

Table Decorations, &c.

At Newcastle these are always a feature of interest, and the present exhibition quite sustained its reputation, but the competitors were mostly local, although the prizes were all that one could wish.

For a single stand for the drawing-room, in the open class, the 1st prize, in a close competition, went to Mr. F. Edmondson, Green Market, Newcastle, with a choice arrangement, Orchids being a feature.

Miss Edmondson, Fern Avenue, Newcastle, was a good 1st for a basket tastefully arranged. The same lady was 1st for a hand bouquet, prettily made in an informal manner; and 2nd for a bride's bouquet, scarcely so good as the 1st, from Mr. F. Edmondson, both being of the fashionable shape. The best of the sprays came from Mr. John Battensby, who also had the best of the button-holes.

The amateurs' section was almost equal to the foregoing; here Mr. J. Battensby was 1st for an epergne, arranged in excellent fashion, and for a basket of flowers; and Mr. Thos. Battensby, Swalwell, 1st for both bridal and hand bouquets.

Fruits.

This section was decidedly superior to the past two years, taken collectively. For collections of fruit, Mr. McIndoe, gr. to Sir J. W. Pease, Hutton Hall, was 1st for both eight and four varieties; the former was a strong exhibit in every way, and well worthy of his reputation. Black Hamburgh and Muscat of Alexandria Grapes, both being large in bunch, and well-coloured, Magdalen Peaches, Clapp's Favourite Pear (good), Pitmaston Orange Nectarines (extra fine), Black Tartarian Cherries and Monarch Melon being the best dishes.

Mr. Goodacre, gr. to the Earl of Harrington, Elvaston Castle, was a capital 2nd for eight sorts—Muscat Hamburgh Grapes and Muscat of Alexandria, both being good; Dymond Peaches, very fine in colour; Lord Napier Nectarines, and Brown Turkey Figs, also good. Mr. Hunter, gr. to the Earl of Durham, Lambton Castle, was 3rd in this class, and 2nd for four kinds, his dishes of Grapes being the best in both classes. Mr. Hunter also took 1st in a close competition for four bunches of Grapes in two or more varieties, showing Black Hamburgh and Gros Maroc, both finely coloured, the former large in bunch, and the latter in berry. Mr. J. Wood, gr. to E. Hopper, Esq., Morpeth, came a near 2nd, by staging Mrs. Pince, as black as Sloes, and Muscat Hamburgh, also very good.

Mr. McIndoe was 1st in the Muscat class, with well-ripened fruit; Mr. W. Stewart following. Mr. McIndoe won again for any other white, with Golden Champion; Mr. Atkinson, Matfen Hall Gardens, Newcastle, being 2nd, with Buckland Sweetwater.

Black Hamburghs were best from Mr. Wood, who had large, well-coloured bunches; Mr. McIndoe following closely. For any other black var., Mr. J. Wood won again, this time with Muscat Hamburgh, well finished; Mr. Goodacre taking 2nd place with Madresfield Court, perfectly black.

The best Melons were Frogmore, green-flesh, from Mr. D. Williams, gr. at Duncombe Hall Gardens, Helmsley; and Duke of York, scarlet-flesh, from Mr. Hunter.

Mr. Goodacre had the best Peaches in Dymond, and the best Nectarines in Lord Napier; Mr. McIndoe following closely in the former instance with Noblesse, he also taking 1st for Cherries with Black Tartarian.

Mr. Goodacre took first in a strong class with

Perfection Tomatos, a variety still bad to beat in competition. Two very good Queen Pines came respectively from Mr. J. Hunter and Mr. Nicholas, the prizes being awarded in the order named.

Miscellaneous Exhibits.—These were chiefly from the trade, and were particularly good. Messrs. W. Fell & Sons, Hexham, staged a splendidly-grown collection of Conifers, chiefly species of Retinosporas in varied forms with others, and chiefly golden-tinted examples of Cupressus and Junipers. From Mr. J. Douglas came the new seedling Carnations which he is sending out, six of these taking special awards as new kinds. Very fine Malmaisons and other Carnations came from Messrs. Laing & Mather, Kelso, notably the former, which were grand blooms. Messrs. W. & J. Birkenhead, Fern Nursery, Sale, had a large exhibit of choice kinds of Ferns in large variety, including several filmies. Messrs. J. Laing & Sons, Forest Hill, staged some immense flowers of tuberous Begonias, the doubles preponderating. Messrs. B. S. Williams & Sons, Upper Holloway, had a fine group of choice Orchids, as well as good examples of other foliage and flowering plants. Messrs. Little & Ballantine, Carlisle, had a large group of Palms effectively arranged with well-coloured Crotons and Dracænas, also Musa Cavendishii, and some pot Vines, to show their fertility. Messrs. J. Robson & Sons, Hexham, had a splendid display of Hydrangea paniculata grandiflora, intermixed with well-grown Conifers and dwarf variegated shrubs. Mr. Andrew Irving, Kyles of Bute Nurseries, showed a large variety of show and fancy Pansies, and a numerous selection of bedding Violas.

Messrs. Kent & Brydon, Darlington, showed hardy cut flowers and decorative plants, including in the former an improved form of Chrysanthemum maximum. Messrs. Edwards & Son, Sherwood, Notts, had a large assortment of Ferns in their pottery ware, which made an attractive display.

Law Notes.

MANCHESTER LIBEL CASE.

Great interest has been felt, in and about Manchester, about a case which those at a distance can only regret should ever have been suffered to come into court. The case was one in which Mr. Bruce Findlay claimed damages against Mr. Benjamin Armitage to the amount of £1000 on account of an alleged libel, and against the *Manchester City News* for publication of the aforesaid libel. Mr. Bruce Findlay is well known in the horticultural world, and some of us know something of the difficulties of his position in having to grow plants at all near Manchester, and in having to deal at the same time with a variety of things irrelevant to botany or horticulture, and, as we think, unworthy of a society which calls itself Royal Botanical. The management of a garden is one thing, and, we should have thought, quite sufficient to tax the energies of the most competent gardener, but when large flower-shows and "variety entertainments" are superadded, it would not be surprising if some departments were better attended to than others. Of the defendant, Mr. Benjamin Armitage, the horticultural public out of Manchester knows nothing, but we do not think that the style of his epistolary criticisms, as published in the full report of the trial in the *City News*, is such as to inspire confidence. Mr. Armitage has been a member of the council for seventeen years, but was not re-elected at the last election. He is alleged to have suggested want of cultural knowledge on the part of Mr. Findlay, and want of attention in financial matters. Mr. Armitage denied, by the mouth of his counsel, that his remarks were meant to apply to Mr. Findlay. Expert evidence was afforded to show that the Orchids and other plants were in good condition. Other expert evidence was to the effect that the condition of the Orchids was not satisfactory.

The Judge, in summing up, pointed out that fair comment upon the condition of the gardens and of the things there exposed to the view of the visitors, and upon the cultivation, and also the mode of management, and the skill of the persons engaged in dealing with the gardens were all matters of public interest in Manchester. Therefore fair comment upon these things in a public newspaper was not in law libellous. Fair, honest, independent, bold, even exaggerated criticism, would not be libellous. It must be a misstatement of facts before it became libellous. If, instead of candidly and honestly criticising, a person used the occasion of commenting upon what purported to be a public matter as an opportunity for maligning an individual, if he were actuated by indirect motive or malicious motive against an individual, or used the opportunity for venting his spite against an individual, that was not fair criticism or fair comment, and it was libellous. Mr. Findlay was in such a position that it would have been fair comment providing the criticism was honest. No one had a right to make a mis-statement. It was suggested for the plaintiff, that there were circumstances between the parties which had created soreness between them, and it was suggested that this furnished one of the motives which operated upon the mind of the defendant when he published these letters. That was absolutely denied by Mr. Armitage. Another class of evidence had been given in the case, as to what was the actual condition of the Gardens, particularly the Orchids. The plaintiff said the condition of the Gardens was such that no one with a knowledge like the defendant, who was said to be more or less an expert in these matters, honestly looking at the Gardens, could honestly state what he had stated in these letters. That was why the plaintiff had called gardeners to prove that the Old Trafford Botanical Gardens compared favourably with other gardens. On the other hand, evidence rebutting that was called, not as justifying what had been said of the plaintiff, but as showing that the opinion expressed in this letter, whether right or wrong, was such an opinion as might honestly be formed. It was enough for the defendant to know that the opinion was justified in this sense—that men of proved competence could fairly form the same judgment the plaintiff formed. There had not been much evidence as to the condition of the Gardens outside the special matter of the Orchids; and no doubt, although this letter alluded particularly to the Orchids, it did not limit itself to the Orchids.

The jury would have to consider various points. First, did they think the words were in their ordinary sense defamatory, conveying an injurious imputation? second, did they think they applied to the plaintiff? and third, if so, did they think the defendant exceeded the bounds of fair criticism? In other words, did they think it was an honest statement, fairly made, without indirect motive whatever? If they did, their verdict would be for the defendant. On the other hand, if they thought the words were not written honestly, their verdict would be for the plaintiff, and they must say what damages must be awarded him.

After a short absence from Court, the jury returned a verdict for the plaintiff, damages £25, and judgment was entered accordingly.

In the second action, Findlay *v.* the *Manchester City News* Company Limited, counsel, during the deliberations of the jury, agreed to abide by the verdict in first case, and upon the result being announced, His Lordship gave judgment for the plaintiff in the action against the *City News*, damages 40*s*.

Book Notice.

Annals of the Royal Botanic Garden, Calcutta. Vol. IV. *The Anonaceæ of British India.* By George King, M.B., F.R.S., &c. 1893.

We have from time to time noticed the publication of Dr. King's *Materials for a Flora of the Malayan Peninsula*, and the volumes of the *Annals* as they have appeared. The present volume, which is as bulky as its predecessors, consists of a monograph of the very difficult natural order Anonaceæ, with 220 lithographed plates, illustrating all the species described, many of the plates containing figures of two species. This is preceded by a preface, embodying a brief history of the foundation of the Calcutta Botanic Garden in 1787, and a biographical sketch of Colonel Kyd, its founder, of whom a portrait is given, and to whose memory this volume is very appropriately dedicated. Before proceeding to discuss the monograph, we may give some particulars of the garden and of its founder. Robert Kyd belonged to an old Forfarshire family, several members of which had preceded him in the service of the Honourable East India Company. He was born in 1746, and in 1764 received his commission as ensign in the Bengal Engineers. He attained the rank of lieutenant-colonel in 1782, and died at Calcutta in 1793. Himself a keen gardener, he brought together, in his own garden at Shalimar, a considerable collection of plants of economic and horticultural interest. Later, he conceived the idea of establishing a botanic garden, or garden of acclimatisation, near Calcutta, primarily with a view to introducing the cultivation of spices, Tea, Coffee, Tobacco, Cotton, and other economic plants, in the territories subject to the company. The commercial aspect he gave to his scheme ensured its success, and it was taken up with alacrity. Without waiting for the sanction of the court of directors in London, the Calcutta government purchased land for the proposed garden, "in anticipation of sanction." The ground acquired for the purpose had an area of more than 300 acres, and was therefore larger than Kew Gardens; but, some years later, it was reduced by about 40 acres, thus bring it to very nearly the same size as Kew. It is a narrow strip extending for about 1½ mile along the right bank of the Hooghly, and expanding into a large square at the lower end. Colonel Kyd's private garden adjoined the present botanic garden. Dr. King prints the principal correspondence connected with the establishment of the garden, and it is highly interesting, but it would occupy too much space to be reproduced here.

To return to the monograph itself. Everybody knows, whether botanist or gardener, how much greater the difficulties of naming are when we have to do with trees and shrubs than with herbaceous plants; and the difficulties are, of course, relatively very much greater with herbarium specimens than living plants. For the purposes of his work, Dr. King was practically limited to herbarium specimens, and all the members of the Anonaceæ are woody; chiefly trees and climbing shrubs, with a great sameness of foliage pervading the whole family. Taking these facts into consideration, some idea may be formed of the magnitude and monotony of the task Dr. King has happily accomplished, and also of the value to science of a fully-illustrated monograph, such as the one in question. The number of species described is 270, a large number by Dr. King for the first time; and they are referred to twenty-seven genera. The latter, with unimportant exceptions, are defined and arranged as in Bentham and Hooker's *Genera Plantarum*, published in 1862. Griffithia is the only new genus described, and that was long ago proposed in manuscript by Maingay. As in previous volumes, the whole of the matter is in English; and the drawings and lithographs, with very few exceptions, were done by natives. For botanical purposes, the drawing generally is sufficient and accurate, though there is often a neglect of perspective that is trying to the eye; but the lithography is excellent. With regard to nomenclature, it is satisfactory to see that the author has not adopted, nor even recognised, the existence of Kunze's unnecessary alterations. From a horticultural standpoint, the Anonaceæ offer little, as they are mostly of too large dimensions for cultivation in any but very large glass-houses; and they do not flower freely under artificial conditions. Yet there are many having very beautiful flowers, especially in the genera Unona, Goniothalamus, and Polyalthia.

MARKETS.

COVENT GARDEN, *July* 19.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. ED.]

POTATOS.

Potato market not quite so firm. Prices vary from 4*s.* to 10*s.* per cwt. Old Potatos finished.

SEEDS.

LONDON: *July* 18.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report an absence of buyers on to-day's market, with very few transactions passing. The low prices ruling for French Trifolium fail to attract buyers. Clover seed meets with no attention. Samples of new English Rapeseed are now to hand. There is no change in Mustard. Canary seed is firm, stocks in England are at a low ebb, whilst the Turkish crop prospects are spoken very badly of. Hemp-seed is steady.

FRUITS AND VEGETABLES.

BOROUGH AND SPITALFIELDS: *July* 17.—Quotations:—Cabbages, 1*s.* 6*d.* to 2*s.* 6*d.* per tally; Carrots, 1*s.* 6*d.* to 2*s.* 6*d.*; Turnips, 1*s.* 6*d.* to 2*s.*; Parsley, 2*s.* per dozen bunches; Onions, Egyptian, 4*s.* 6*d.* to 5*s.* 6*d.* per cwt.

STRATFORD: *July* 18.—The supply to this market during the past week has been excellent, and, with a large attendance of buyers a brisk trade was done at the undermentioned quotations:—Cabbages, 1*s.* to 3*s.* 6*d.* per tally; Black Currants, 3*s.* 3*d.* to 4*s.* per half-sieve; red Currants, 3*s.* 6*d.* to 4*s.* do.; Cherries, 3*s.* to 6*s.* do.; do., Dutch, 1*s.* to 2*s.* per basket; Pears, 1*s.* to 1*s.* 6*d.* per molly; Cucumbers, 1*s.* to 2*s.* per dozen; Turnips, 2*s.* to 3*s.* per dozen bunches; Carrots, household, 1*s.* 9*d.* to 2*s.* 3*d.* do.; Mangels, 18*s.* to 21*s.* per ton; Onions, Egyptian, 5*s.* to 5*s.* 6*d.* per bag.

FARRINGDON: *July* 19.—Quotations: Cabbages, 1*s.* 6*d.* to 2*s.* per tally; Onions, 2*s.* to 2*s.* 6*d.* per dozen bunches; Carrots, 1*s.* 6*d.* to 2*s.* do.; Turnips, 2*s.* to 3*s.* do.; Peas, 1*s.* 6*d.* to 2*s.* per bushel; Peas, sacks, 2*s.* 6*d.* to 3*s.* 6*d.*

POTATOS.

BOROUGH AND SPITALFIELDS: *July* 17.—Quotations ranged from 6*s.* to 12*s.* per cwt. for new. There were no fixed quotations for old Potatos.

STRATFORD: *July* 18.—Quotations:—Kidneys, £6 to £7; White Hebrons, £6 to £7; Cherbourg Flukes, £6 to £7; St. Malo Hebrons, £5 to £5 10*s.*; Sutton's Early Regents, £5 to £5 10*s.*; Snowdrops, £6 10*s.* to £8; Cherbourg Rounds, £4 10*s.* to £5 10*s.* per ton.

FARRINGDON: *July* 19.—Quotations:—Bedford Hebrons, £7 to £8; white do., £7 to £8; Bedford Puritans, £5 to £7; Early Puritans, £5 to £5; Daniell's, £5; Hebrons, £5 to £5 10*s.* per ton.

LONDON AVERAGES: *July* 18.—Jersey, 6*s.* to 7*s.* 6*d.*; Cherbourg, 5*s.* to 7*s.* 6*d.*; Kidneys, 6*s.* to 8*s.*; Maltese, 6*s.* to 7*s.*; Lisbons, 5*s.* to 6*s.*; Regents, 5*s.* to 6*s.* per cwt.

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 110*s.* to 138*s.*; do., inferior, 80*s.* to 120*s.*; hay, best, 100*s.* to 130*s.*; do., specially picked, 135*s.*; inferior, 60*s.* to 100*s.*; Mixture, 90*s.* to 127*s.*; and Straw, 43*s.* to 60*s.* per load.

THE WEATHER.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Districts.	Temperature: Accumulated: Above (+) or below (−) the Mean for the week ending July 14.	Temperature: Accumulated: Above 42°, for the Week.	Temperature: Accumulated: Below 42°, for the Week.	Temperature: Accumulated: Above 42°, difference from Mean since January 1, 1894.	Temperature: Accumulated: Below 42°, difference from Mean since January 1, 1894.	Rainfall: More (+) or less (−) than Mean for the Week.	Rainfall: No. of Rainy Days since Jan. 1, 1894.	Rainfall: Total Fall since Jan. 1, 1894.	Bright Sun: Percentage of possible Duration for the Week.	Bright Sun: Percentage of possible Duration since Jan. 1, 1894.

*	2 —	118	0	+ 235	− 18	13 +	138	17·1	37	45

The districts indicated by number in the first column are the following:—

0, Scotland, N. *Principal Wheat-producing Districts*—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. *Principal Grazing, &c., Districts*—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; *Channel Islands.

THE PAST WEEK.

THE following summary record of the weather throughout the British Islands for the week ending July 14, is furnished from the Meteorological Office:—

"The *weather* during this period was very unsettled and rainy over the entire Kingdom. Thunder and lightning occurred in many places during the middle part of the week, and again in some localities towards its close.

"The *temperature* slightly exceeded the mean in 'Scotland, E.,' and just equalled it in 'Scotland, N. and England, N.E.;' in all other parts of the Kingdom it was below, the deficit being 1° in 'Scotland, W. and England, N.W.,' and 2° elsewhere. The highest of the maxima were recorded on rather irregular dates, and ranged from 75° in 'England, E.,' and 73° in 'England, N.E. and the Midland Counties,' to 67° in 'Scotland, N. and the Channel Islands.' The lowest of the minima were registered on the 8th, when they ranged from 39° in 'Scotland, E.,' to 46° in 'England, S.,' and 52° in the 'Channel Islands.'

"The *rainfall* was less than the mean in the 'Midland Counties,' 'Scotland, W.,' and 'England, N.W.,' but exceeded it in all other districts. In 'Scotland, N.,' 'England, E. and S.,' and in 'Ireland, S.,' the excess was very large. The falls which were experienced over 'England, S. and S.E.' during the latter part of Tuesday, and in 'Scotland, N.E.' early on Thursday, ranged from 1·6 ins. to 1·0 in., and to nearly an inch in several other regions.

"The *bright sunshine* was less than the normal in almost all districts, the deficit being most marked in 'Ireland and Scotland.' The percentage of the possible duration ranged from 8 in 'Scotland, N.,' 16 in 'Scotland, E.,' and 17 in 'Ireland, N.,' to 37 in the 'Midland Counties and the Channel Islands,' and to 41 in 'England, S.'"

Answers to Correspondents

*** *Owing to the large increase in our circulation, we are reluctantly under the necessity of going to press some hours earlier. Our contributors, who well know what this implies, will kindly aid us by sending their communications as early in the week as possible. Communications should reach us not later than Wednesday.*

BAUHINIA GALPINI, &c.: *L. v. d. B. Tirlemont.* 1, B. Galpini belongs to the section Phanera; 2, Acacia albicans, Kunth. = Pithecolobium albicans, Bentham. A. Bartheriana we do not know. Do you mean A. Berteriana? If so, see Pithecolobium fragrans; see also *Trans. Linn. Soc.*, vol. xxx., p. 592. 3, Rubus Greggi. We do not find the name.

BOOKS: *J. T. L. Choice Stove and Greenhouse Plants*, by B. S. Williams, Paradise and Victoria Nurseries, Holloway, London, N.

BORDEAUX MIXTURE: *Head Gardener.* It may be used as you purpose, but it must be washed off all the bunches before consumption.

CACTUS AT THE ROYAL HORTICULTURAL SOCIETY'S MEETING, JULY 10.—Mr. J. W. Singer desires us to state that his collection numbered 166 plants, and was therefore strictly speaking *not* a "small collection," as every one was distinctly different.

DO LEAVES ABSORB WATER: *Student.* This is still a debated question. It is difficult for structural reasons to see how it is possible for some leaves, such as Cabbage leaf or a Holly leaf, to absorb water. On the other hand, it is certain that other leaves can and do absorb water, and are benefited thereby. The truth seems to be, that healthy leaves provided with sufficient water in their tissues do not absorb any more, but if they are flagging or shrivelled for want of water, then they will, as every gardener knows, absorb it freely if applied.

EMPLOYMENT IN THE LONDON PARKS: *F. T.* To the superintendents.

FRUIT REPORT: *J. Adam, Son & Co.* It will appear in our issue for August 4.

GRAPES: *Head Gardener.* Some of the berries are shanked. Look to the roots. Do not denude more of the foliage than is necessary, and lighten the crop if it be a heavy one.

LÆLIA TENEBROSA: *F. L. G., Hague.* This is now the recognised name of the plant formerly known as L. grandis tenebrosa.

MALAGA GRAPE, &C.: *B. W. W.* A variety is quoted in Hogg's *Fruit Manual* under this name, but its proper name is stated to be Gromier du Cantal. It has half a dozen synonyms. The bunches average 1 foot long, and they are broad and shouldered; berries round and large; skin thin, and amber coloured; flesh tender, juicy, and sweet, with a brisk vinous flavour. It does not keep long after being ripe. In so far as colour goes, this description fits in with yours of the Grape from Belgium. Can you send berries, leaves, and shoots? The variety called Syrian in this country has several synonyms, viz.:—Palestine, Jew's,

Raisin de Jericho, Terre de la Promesse. The variety is sometimes exhibited, but it does not find favour from the judges, although it is of good flavour when well ripened.

Mushroom Culture for Market: *August Reiser.* We decline the responsibility of advising you in this matter, especially as you have no experience of Mushroom culture. We know that the esculent is consumed in great quantities, and that the retail price is excessively high, considering the cheapness of production; but how much of that price reaches the pocket of the producer we have no cognizance.

Names of Fruit: *R. D. L.* Trollope's Victoria, an old, early, free-bearing variety.

Names of Plants: *H. J.* Cereus grandiflorus (night-blooming Cereus). The Rose Aimée Vibert.—*J. D. S.* Lælia crispa.—*Helen.* We are quite unable to name the specimen sent in the absence of flowers; send again when in bloom.—*Sir C. W. S.* Sidalcea oregana.—*W. R. & Leys.* Calceolaria glutinosa.—*F. S.* 1, Veronica incana; 2, Solidago sp.; 3, Prunella grandiflora; 4, Erigeron philadelphicus; 5, Hieracium aurantiacum; 6, Thalictrum glaucum.—*L. M.* 1, Desfontainea spinosa; 2, Cosmos bipinnatifidus; 3, impossible to name such a scrap.—*J. N.* Diplopappus chrysophyllus.—*G. McA.* 1, a form of Platanus orientalis; 2, Aristolochia sipho; 3, Lilium Martagon; 4, Alchemilla alpina; 5, Aster; 6, Carex sp.—*W. C. R.* 1, specimen insufficient; 2, Campanula Scheuchzeri; 3, Geranium pratense, fl.-pleno; 4, Sedum spurium; 5, Campanula pusilla alba; 6, Monarda didyma.—*C. J. G.* 1, Geranium dissectum; 2, Potentilla argentea; 3, Trifolium arvense; 4, Filago germanica; 5, Angelica sylvestris; 6, Epilobium hirsutum; 7, Lythrum Salicaria; 8, Lathyrus pratensis.—*Constant Reader.* A Juniper or Cypress, impossible to name without cones and perfect mature leaves.—*W. J. D.* 1, Alströmeria aurantiaca; 2, Helenium autumnale; 3, Agrostemma coronaria; 4, Hieracium aurantiacum.—*W. M.* Spiræa Lindleyana.—*J. T. L.* A plant more generally known in gardens as Grammatophyllum Ellisii. Yours is an exceptionally good variety of it.

Peach Foliage Falling Off: *A. B.* Without seeing the trees, and knowing exactly the treatment accorded, we cannot say what has caused the total loss of the foliage. The symptoms seem to point to the application of strong manure to the roots.

Roots of Cucumbers: *J. B.* On examination we can discover no eelworms; and the failure of the plants may be due, as you surmise, to their roots having got into the manure from the stable in which are the voidings of the animals under veterinary treatment.

Spotting of the Blooms of Oncidium. "*Spot.*" Too much moisture in the air, and too little ventilation, aggravated probably by the want of fire-heat.

Strawberries: *G. M.* We are really unable to name the six sorts of Strawberries you send us—this is partly owing to the bad way in which they were packed with dirty cotton-wool. Moreover, the fruits were more or less smashed and mixed up.

Tomatos: *Head Gardener.* The flowers have set in most cases, and the fruits will go away all right if you do not use the watering-pot and the syringe too freely.

Vine Mildew: *Eastwood, F. Fulford, H. C. W., and others.* See p. 75.

Communications Received.—A. Long, will appear with our Annual Report.—D. Hayler.—T. W. Thornton.—W. P.—L. & S.—T. M., Philadelphia.—M. & W.—W. T.—H. C. P.—R. Sueden.—F. M.—M. C. C.—N. E. Br.—A. F. CONTINUED INCREASE in the CIRCULATION OF THE "GARDENERS' CHRONICLE."

Important to Advertisers.—*The Publisher has the satisfaction of announcing that the circulation of the "Gardeners Chronicle" has, since the reduction in the price of the paper,*

Increased to the extent of 80 per cent.

Advertisers are reminded that the "Chronicle" circulates among country gentlemen, and all classes of gardeners and garden-lovers *at home, that it has a specially large* foreign and colonial circulation, *and that it is preserved for reference in all the principal Libraries.*

ROBERT WARNER & Co., Engineers, 27, Jewin Crescent, E.C.

Dear Sirs,—It affords me much pleasure to inform you the 25 ft. Annular Sail Windmill, on 40 feet timbers, working a set of 3 in. × 9 in. stroke treble pumps, that you fixed here for Baron Schröder, is giving very great satisfaction, pumping the water through 4,224 feet of pipe, to a vertical height of about 80 feet. I must also express my thorough appreciation of the manner in which the whole of the work has been so successfully carried out.—Yours faithfully,

H. BALLANTINE, Head Gardener to Baron Schröder.

We have just made and erected a similar Mill and set of Pumps for Lord Northbourne.

ALL IS NOT GOLD THAT GLITTERS may be said about many brilliant prospectuses that are frequently issued to financiers; they often herald the formation of companies which go up like the proverbial rocket and come down like a stick. HOLLOWAY'S PILLS and OINTMENT, unlike such shaky ventures, are the soundest investments in which people suffering from disease can entrust their money. They have the reputation of over half a century, and every day they return substantial dividends in the form of good health. No disease has yet disputed their influence when a fair trial has been given. They cure dysentery, diarrhœa, weakness, and liver and kidney diseases, whilst for skin diseases they have no equal. Sold by all chemists, &c.

SALES BY AUCTION.

Friday Next.

A Collection of about 335 well-established and healthy PHALÆNOPSIS growing on native sticks, as received, comprising:—

PHALÆNOPSIS SCHILLERIANA
" AMABILIS
" LEUCORRHODA
" TYPHEMMANNIANA
" ROSEA

Also a parcel of about 80 PANAMA HATS.

MESSRS. PROTHEROE AND MORRIS will SELL the above by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on FRIDAY NEXT, August 3, at half-past 12 o'Clock.

On view morning of Sale, and Catalogues had.

Friday, August 3.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London E.C., on FRIDAY NEXT, August 3, at half-past 12 o'Clock, by order of F. Sander & Co., St. Albans,

Imported and Established ORCHIDS, among which will be found,

A NEW ORCHID,
LÆLIA MAJALIS ALBA.

AN ABSOLUTE ALBINO.

This and Cologyne cristata alba are the only two really pure white Orchids known; and, although the former is exquisitely pure and lovely, this snow-white Lælia, by the size of its flowers and its general magnificence, is perfectly unapproachable.

A Photograph of one of the Plants in Flower will be shown on day of Sale.

Every plant found is offered.

The remaining unsold lots of CATTLEYA DORIDA will also be offered:—

CYPRIPEDIUM BELLATUM, ŒNCOLOR, GODEFROYE LEUCOCHILUM PARISHII, and ROTHSCHILDIANUM.

DENDROBIUM PHALÆNOPSIS SCHRODERIANUM.

BLETIA SPECIES from Peru. A NEW ODONTOGLOSSUM, in the way of Sanderæ.

MILTONIA FLAVESCENS GRANDIFLORA, a fine importation.

DISA VEITCHII, VANDA TERES, and ROXBURGHII.

CATTLEYA LABIATA, CYPRIPEDIUM INSIGNE, MONTANUM, &c.,

Sevenoaks, Kent.

UNRESERVED SALE of the whole of the EXHIBITION and other DECORATIVE PLANTS, ORCHIDS, &c., by order of Mrs. Laura Crawshay, who has given up exhibiting.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION on the premises, Heathcourne Hall, Sevenoaks, Kent on THURSDAY, August 9th, 1894, at 12 for 1 o'clock precisely, the whole of the well-known and successfully exhibited STOVE and GREENHOUSE PLANTS, comprising fine specimen FERNS in variety, PALMS of Sorts, Alhmandas, Ixoras, Lapagerias, Stephanotis; also grand examples of CYCAS REVOLUTA, 70 leaves, Dasylirion; 50 lots of ORCHIDS, viz., Cattleyas, Lælias, Odontoglossums, &c., together with Bouvardias, Camellias, Agapanthus, Calodiums, Caliea Speciosa, Violets, Deutzias, &c.

May be viewed any day prior to Sale. Catalogues may be had of Mr. JAMES GOODMAN, Gardener, on the premises, and of the Auctioneers, 67 & 68, Cheapside, E.C.

Note.—The above Plants have for years past annually taken prizes at the Sevenoaks and other Shows. All are in grand health and suitable for exhibitors and decorative purposes.

Cotham Nursery, Bristol.

TO NURSERYMEN, FLORISTS, SEEDSMEN, and OTHERS.

MESSRS. ALEXANDER, DANIEL, SELFE AND CO. are instructed by the Owner, who is now retiring, to negotiate for the IMMEDIATE DISPOSAL of the well-known and long-established BUSINESS successfully conducted for many years by the late Mr. Bush and his successors.

The Premises at Cotham are FREEHOLD, and comprise an excellent RESIDENCE, with Rooms for man-servant adjoining; pretty Lawn, of good size, with a succession of Glass-houses on three sides of the quadrangle; Nursery, with choice Grotto; Glass-covered Corridor, used as a Vinery, with Yard and Gates extending to St. Michael's Hill.

Also, at ST. MATTHEW'S ROAD is a SECOND NURSERY, with Glass Structures, an excellent FREEHOLD STABLE and COACH-HOUSE, with Loft, Yard, &c.

At BRENTRY, a NURSERY of about Three Acres, now in first-class cultivation, and containing a Valuable Stock.

THE FREEHOLDS may be purchased or rented, as preferred. STOCK-IN-TRADE and APPOINTMENTS at the several places to be taken at a Valuation.

For all particulars as to Price, Rental, &c., apply to ALEXANDER, DANIEL, SELFE & CO., Valuers and Estate Agents, Bank Auction Mart, Corn Street, Bristol (and 34, Old Jewry, London, E.C.).

WANTED, to RENT or PURCHASE, Modern Nursery (glass), or a few acres of good grass land within road delivery of Covent Garden.—S. P., 41, Wellington Street, Strand, W.C.

NURSERY for SALE.—Eight Greenhouses, 60 feet by 12 feet, heated with 4-inch Flat-water Pipes, and about 50 Pot Lights, Horse and Van, Stable and Stock. Size of Land, 154 feet by 126 feet deep; on Lease.

THOS. MATTINGLY, 149, Church Road, Lower Tottenham.

FOR SALE, a Small, Old-established GLASS NURSERY, situated near large town, South Coast, comprising about an Acre of Ground, Leasehold, and 10,000 feet of good, well-heated Glass, large Stock, Sheds, Furniture of Cottage, &c. Average £1,000 part can remain. Owner retiring. Principals only.—Address, Miss M. BASHAM, Holt, Norfolk.

Windlesham, near Bagshot.

VALUABLE FREEHOLD and LEASEHOLD NURSERIES.

FOR SALE, by order of the Executor, the several Nurseries of FREEHOLD GROUND, in all 31 acres 2 roods 38 poles, and the LEASEHOLD NURSERIES, in all 16 acres 1 rood 11 poles, being Extensive Nurseries, Windlesham, and carried on so successfully for many years by the late Mr. Mason.

The purchaser will have the option of taking the Stock at a valuation in the usual way, or a portion could be sold by Auction. Arrangements for payment could be made to suit the convenience of purchasers.

Full particulars of Messrs. PROTHEROE AND MORRIS, Auctioneers, 67 and 68, Cheapside, E.C.

LONDON, N. (Folio 8245).—Capital NURSERY, comprising eight span-roof Greenhouses, well-heated, Stables, and other Outbuildings. Lease twenty-one years. Ground Rent £70. BULBS from BERMUDA, per Parcel Post, Post-free.—BERMUDA EASTER LILY, 5s. per dozen; 35s per 100. FREESIAS, 1s. 6d. per dozen; 4s. per 100. SPIDER LILY, 2s. each; 16s. per dozen. RED SPICE, 2s., 3s., and 4s. each. CALLAS, 7s. per doz. Sample box of Bulbs, post-free, 5s. Cash with order. P.O. Order or Bank Draft on Bermuda. Order early, Stock limited.—H. A. GRANTHAM, The Floral Depôt, Hamilton, Bermuda. Mention *Gardeners' Chronicle*.

LATE STRAWBERRIES.

Let us sing to the praises of three late Strawberries.

FROGMORE LATE PINE, which is absolutely the flavour of Ripley Queen Pineapple, sturdy in growth, large in size, and an abundant cropper. 7s. 6d. per 100.

OXONIAN, true, not Eleanor, which it is generally supplied for. It is simply an enormous cropper, rather sharp in taste, and the latest Strawberry on record. 5s. per 100.

Now comes lastly, but not leastly, that good old public servant, ELTON LATE PINE, warranted true; no other Strawberry like it for preserving.

All the New Strawberries supplied, all warranted true, and the best plants in the trade.

R. GILBERT, Burghley, Stamford.

EUCHARIS AMAZONICA. — Established from an importation received last spring. Strong and healthy. Price on application.—G. BETHELL, Whiteley's Nurseries, Hillingdon Heath, Uxbridge.

STRAWBERRIES

LAXTON'S "ROYAL SOVEREIGN."

An earlier higher quality and Improved Sir J. Paxton

Three Medals and Five First class Certificates awarded.

All must have the finest early Strawberry yet introduced. Fruit of the largest size, brighest glossy scarlet colour, flavour rich (quite equal to British Queen), ripens with Noble; a splendid cropper and grower, and we consider it to be the long-sought EARLY HIGH-FLAVOURED AND IMPROVED SIR J. PAXTON, a splendid forcer, and in every way worthy of its name. Handsome coloured plate, now ready, 6*d.* (gratis to customers).

12*s.* per doz., £3 per 100; in pots, 18*s.* per doz., £4 per 100.

LAXTON'S SENSATION.

First-class Certificate Gardening and Forestry Exhibition, May 10, 1893.

An enormous second early variety of good flavour, and probably the largest Strawberry ever introduced. A remarkably strong grower, and producing fruit in wonderful clusters. Will prove a welcome addition to the list of good sorts. Forces splendidly.

20*s.* per 100, 4*s.* per doz.; in pots, 30*s* per 100, 6*s.* per doz.

LAXTON'S SCARLET QUEEN.

(First-class Certificate)

The best first early—very early. Fine colour and shape, and the richest flavour. Habit strong, a very prolific variety, a splendid early table and market fruit.

10*s* per 100, 3*s.* per doz.; in pots, 18*s.* per 100, 4*s* per doz.

LAXTON'S LATEST OF ALL.

The best late Strawberry, and the largest and best late variety. A seedling from British Queen, but much later. Flavour grand.

8*s.* per 100, 2*s.* per doz.; in pots, 16*s.* per 100, 3*s.* per doz.

The following best varieties for forcing or early planting can be supplied STRONG in pots at once:—

	Per 100.		Per 100.
A. F. Barron	15*s.*	King of Earlies	15*s.*
Nicaise	15*s.*	Grosse Sucrée	16*s.*
British Queen	15*s.*	Latest of All	16*s.*

SATURDAY, JULY 28, 1894.

ROBERT JOHN THORNTON, M.D.

THE biographer of Curtis, founder of the *Botanical Magazine*, and of James Lee, the elder, of the Vineyard Nursery, Hammersmith, deserves himself more from the pen of the biographer than he has hitherto received. Thornton was in many ways a remarkable man, and very active in garden botany, as well as in other branches of knowledge; yet, strange to say, he is scarcely mentioned by contemporary and succeeding writers on authors and works relating to botany and horticulture. Like Sir John Hill, of a little earlier date, he was a prodigiously fertile writer and compiler of books of a kind that require considerable knowledge and taste, and which involved extensive research; yet they were not sufficiently original to place the author in the first rank, either from an artistic, literary, or scientific standpoint. I cannot find the exact date of his birth. Britten and Boulger (*Biographical Index*) give it as probably 1758, and the same authorities state that he took the degree of M.B. at Cambridge in 1793, and was made M.D. of St. Andrew's in 1805. He died in 1837, and there is a short notice of his life and works in the *Gentleman's Magazine* for that year, from which I will extract some particulars, before describing some of his numerous publications on plants. He came of a line of medical men, although his father, Bonnell Thornton, gave up the profession in favour of literary pursuits. He, the father, translated Plautus, and was one of the editors of the *Connoisseur*, a humorous publication, that enjoyed great popularity in its day. Robert John Thornton was remarkable for passing the whole of his school holidays in collecting objects of natural history; and he devoted the play-hours at school in forming a small garden and menagerie. At the age of fifteen he was sent to Cambridge, with the intention of being educated for the church; but he evinced such a decided preference for the study of medicine and cognate subjects, that the original idea was abandoned. The early death of his only brother left him with the means to choose his own career, and live without a profession; but he nevertheless, continued his medical studies, and entered Guy's Hospital for the purpose of qualifying. There he attended the lectures of Mr. Clive and Dr. Babington. According to the account in the *Gentleman's Magazine*, he did not take his Cambridge M.B. until 1797, when he would have been thirty-nine years of age; but there is assuredly some error in the dates. His father died in 1768, and it seems more probable that that was about the date of the birth of our author. On taking his degree, he gave as his thesis, a discovery which he himself had made, contrary to received opinions. "That the animal heat arises from the oxygen air imbibed by the blood flowing through the lungs, and

taken from the atmosphere received into them; and that in its circulation through the body it decomposes."

After three years' study, he visited the continent, and on his return, he started a very successful practice. In 1798 he published his *Philosophy of Medicine*, a work of five octavo volumes, which went through several editions. This was followed, in 1799, by the *Philosophy of Politics*, and various medical works which I will not particularise, as it is only his botanical and horticultural works that directly concern us. Concerning his medical career, I may, however, add that he was four years physician to the Marylebone Dispensary, and on his retirement was presented with a piece of plate. Subsequently, he succeeded Sir James Edward Smith as lecturer on medical botany at Guy's Hospital.

In an article of this nature it would be out of place to attempt a complete bibliography, even of his botanical works; but the following abbreviated titles will give some idea of their variety and extent:—

History of Medical Plants, Elements of Botany, Temple of Flora, Practical Botany, The Philosophy of Botany, A New Family Herbal, Outlines of Botany, Juvenile Botany, The British Flora, A Grammar of Botany, The Greenhouse Companion, and An Introduction to the Science of Botany.

This list is probably not exhaustive, although drawn up from a variety of sources. Some of these books must be very rare, as they never appear in the second-hand catalogues; and several are wanting in the Kew Library. With all his power of production, Thornton not only failed to increase his fortune, he dissipated what he possessed, and "died a beggared man." How this came about may be gathered from the exceedingly costly nature of some of his works. I propose describing one of these in some detail; but I must explain that of his larger illustrated books I have not seen two copies exactly alike—that is to say, containing the same plates and letterpress. The author seems to have issued to each subscriber what he thought he would like, and, as no complete collation exists, so far as I know, it is impossible to say whether a given copy is complete or not. Some of the materials are utilised in more than one of his works. *The Temple of Flora* is an imperial folio, the uncut engravings and letterpress being about 24 inches by 18. Its full title runs thus:

New Illustration
of the
Sexual System
of
Carolus von Linnæus
comprehending
an Elucidation of the several parts of the Fructification.
A Prize Dissertation on the Sexes of Plants,
A full Explanation of the Classes and Orders of the Sexual System,
and the
Temple of Flora or Garden of Nature.
Being picturesque botanical coloured plates, illustrative of the same,
with descriptions,
By Robert John Thornton, M.D.
London, 1807.

I have omitted Thornton's numerous titles, and his motto from Thomson. With regard to the date, there is evidence that the work was issued in parts, the first in 1799; but I have found no clue to the price, which, however, from the character of the typography and engraving, must have been high. It should be understood that I am describing the Kew copy, a very fine one, presented a few years ago by Sir Joseph Hooker. Preceding the elaborate title-page, which I have transcribed, are two sub-titles, in ornamental writing, written by Tomkins, and engraved by Cooper and Vincent. The first is, "A British Trophy in Honour of Linnæus," and the second is "A New Illustration of the Sexual System of Linnæus." Between these is a portrait of the author, painted by Russell, R.A., and engraved by Bartolozzi, R.A. Beneath the portrait is a view of Guy's Hospital. Next comes a half-length portrait of Linnæus, painted by Hoffman, one of his pupils, ornamented by Bartolozzi, and engraved by H. Meyer. Of this there is both a coloured and a plain copy. Immediately following the title-page proper is a portrait of Queen Charlotte, by Sir W. Beechey, R.A. Then comes a dedication to the Queen in about six-character ornamental writing by Tomkins and Cooper, followed by the dedicatory address. Next comes the beginning of the letterpress of the body of the work itself, but even this is preceded by a leaf, bearing only the subtitle, "Preliminary Observations," in letters three-quarters of an inch long. These preliminary observations are brief, yet singularly lucid, and relate to the various modifications of the different parts of the flower, illustrated by a diagrammatic clavis. This leads up to an annotated translation of Linnæus's *Sexum Plantarum argumentis et experimentis novis præter adhuc jam cognita, &c.*

I have not been able to compare this with Sir James Edward Smith's earlier translation; but it appears to be a very careful one, and the exceedingly copious notes indicate a perfect knowledge of the subject. In fact, the notes occupy more space than the translation, of which there is often only one line on these huge folio pages, and sometimes none; the whole page being taken up with Thornton's remarks and extracts. He strongly defends Sir Thomas Millington's claim to be the true discoverer aud expositor of the sexes of plants, contending that Linnæus himself, had he possessed a better knowledge of the English language, would have conceded this. A portrait of Millington by Sir Godfrey Kneller, exquisitely engraved by Woolnoth, is inserted here, with a view of the Radcliffe Library at Oxford, isolated from the surrounding buildings, and the subscription:

"Hic primus ante omnes Florum connubia vidit."

This is followed by a reproduction of Geoffrey's figures of the pollen of various plants, which were originally published in 1711; and considering the microscopes of that period they are not badly done. The second part of the sexual system opens with a full length portrait of Linnæus in Lapland dress, painted by Hoffman, and engraved by H. Kingsbury; the original then being in the possession of Dr. Thornton. There is both a coloured and an uncoloured example of this in the Kew copy.

Passing on to the third part, *The Temple of Flora*, there are eight plates of ornamental writing in the nature of title, sub-titles, dedication, and index. The author seems to have exercised all his ingenuity in multiplying the number of these introductory flourishes. The title, *The Temple of Flora and Garden of Nature*, is a fine piece of writing, with a beautifully-engraved head-piece, from a painting by Burney, representing Flora in a chariot drawn by Cupids, with flowery wreaths.

Even this wealth of preparation was not sufficient to satisfy the extravagance of the author. Before we reach the paintings of the flowers themselves, we have the opportunity of admiring or otherwise three additional heralds. First comes "Flora Dispensing her Favours on the Earth," from a painting by Cosway, R.A., engraved by Woolnoth. The goddess is a very substantial person indeed, poised in mid-air. Following this is a painting, the joint production of Russell, R.A., and Opie, R.A., engraved by Caldwall, representing "Æsculapius, Flora, Ceres, and Cupid honouring the Bust of Linnæus." The glaring colours rather spoil a good engraving. The third picture is by Reinagle, A.R.A., engraved by Burke, the subject being "Cupid inspiring Plants with Love;" an imaginary landscape of mixed tropical and subtropical plants, including Palms, Bananas, and Strelitzia, and others less easily recognised. We now arrive at the pictures of the plants, each of which is followed by copious more or less appropriate poetical effusions, by poets known and unknown. So much stir has recently been made about these plates, twenty-eight in number, that it may be worth while giving a complete list with the names of the painters and engravers. It would occupy too much space to describe them, but they are certainly remarkable and doubtless expensive productions, yet by no means worth the extravagant prices asked by certain dealers. The plants, or portions of plants, in front are of natural size, supported by a more or less elaborate landscape background.

Plant.	*Painter.*	*Engraver.*
Snowdrop	Pether	Ward.
Persian Cyclamen	,,	Elmes.
Group of Hyacinths	Edwards, S.	Warner.
Group of Roses	Thornton	Earlom.
Group of Carnations	Henderson	Caldwall.
Group of Auriculas	,,	Lewis & Hopwood.
Group of Auriculas	Reinagle, A.R.A.	Sutherland.
Group of Tulips	,,	Earlom.
The Queen Flower	Henderson	Cooper.
American Aloe	Reinagle	Medland.
Nodding Renealmia	Henderson	Caldwall.
Night-blowing Cereus	Moonlight by Pether	Dunkarton.
Begonia	Reinagle	Caldwall.
Large-flowering Sensitive	Reinagle	Stadler.
Common Passion-flower	Reinagle	Caldwell.
Winged Passion-flower	Henderson	Warner.
Quadrangular Passion-flower	Henderson	Hopwood.
White Lily	,,	Stadler.
Superb Lily	Reinagle	Earlom.
Dragon Arum	Henderson	Ward.
Hirsute Stapelia	,,	Stadler.
American Bog-plants	Reinagle, A.R.A.	Cooper.
Pitcher-plant	,,	Sutherland.
Pontic Rhododendron	Henderson	Caldwall.
American Cowslip	,,	Warner.
Narrow-leaved Kalmia	Reinagle, A.R.A.	Caldwall.
China Limodoron	Henderson	Landseer.
Indian Canna	,,	Caldwall.
Sacred Egyptian Bean	,,	Burke & Lewis.
Blue Egyptian Water-Lily	Henderson	Stadler.

I must not dwell on the foregoing list, though much might be said respecting each one. A few words of explanation seem necessary, however. Thus, the Queen Flower is Strelitzia Regina; the Nodding Renealmia is Alpinia nutans; the larger-flowering Sensitive is Calliandra grandiflora; the Pitcher-plant is Sarracenia; and the China Limodoron is Bletia Tankervilliæ. The second group of Auriculas and the picture of American bog plants (Sarracenia and Dionæa) are over and above those enumerated in Thornton's own index. I will only allude to one of the plates—Thornton's group of Roses, which is certainly, apart from the somewhat feeble representation of a pair of nightingales and nest in the foreground, one of the most effective of the series.

W. B. Hemsley.

(To be continued.)

New or Noteworthy Plants.

DENDROBIUM M'GREGORII, *F. v. Müll. and Krzl.* (DENDROCORYNE).*

This is, indeed, a little gem. The plant is not very tall, the only specimen examined (fortunately, a very perfect one) not being more than about 8 inches

* *Dendrobium M'Gregorii*, F. v. Müll. and Krzl. (*Dendrocoryne*).—Bulbis basi attenuatis supra incrassatis compressis subtetragonis sub anthesi foliaceis; foliis 2—3 oblongo-lanceo-

in height, with two or three leaves of a moderate size. The flower-stalk is longer than the leaves, and bears three or four flowers of the size of those of a well-developed Dendrobium bigibbum or D. Phalænopsis. The sepals are white, with numerous rose-purple blotches; the petals are large, spreading, and white, with a rose-purple line; the lip has two very large stout side-lobes, of a very deep blood-purple, and a very short reniform middle-lobe, of yellow or orange colour, with some purplish veins. The other characters are of merely botanical interest. The chief character is undoubtedly the short reniform middle-lobe of the lip. The plant was detected by Sir William M'Gregor. It is to be hoped that specimens of this very beautiful plant, which, even in a dried state, is very conspicuous, will be soon imported into this country. *F. Kränzlin.*

A TRAVELLER'S NOTES.

(*Continued from p.* 64.)

South Australia. — The nurseries of Messrs. E. & W. Hackett, C. Newman, and Sewell, are worth a visit. The first-named are the local seed merchants. Their nursery lies but a short distance in the suburbs. *En route,* I was much struck with the large number of Schinus Molle in every direction. In addition to its showy coral-like fruit, its long pendulous slender branches waving with every breath of air, it does not retain the dust; a strong recommendation. Nerines, also common, and other stiff growing plants, are sad sinners in this respect. The trim Melia azadirachta is also a favourite tree for the small front gardens of suburban cottages.

The nurseries of Messrs. E. & W. Hackett are under the direction of Mr. Kemp, but three years out from home. They are yet young, and largely devoted to the production of market plants, Oranges, Loquats, &c. Their shade house, 108 by 60 feet, and 30 feet high, is a fine large structure, the supports of "Jarrah" and the rafters of Oregon Pine, preferred on account of its lightness. The sides of the house and of the lantern have the rafters laid diagonally, those on the roof being straight. Here are various young plants, such as Cyathea excelsa, Dicksonias, and the best Palms for outside planting; Chamærops, Arecas, and other Palms, Norfolk Island Pine, Cryptomerias and Camellias, liable to burn outside until fully established—the last named are chiefly propagated from layers, sufficient for cutting purposes, but do not make neat saleable plants; Ericas and other hard-wooded species, Ferns, &c. English Hollies are found to do badly, the hedge plants of Adelaide being Pittosporum eugenioides and Rhamnus alternifolius; these are clipped twice a year, and the many excellent close hedges round the town testify their suitability for the purpose. The smaller-foliaged Pittosporum nigrescens is also used.

Messrs. Hackett grow Oranges extensively, sown in boxes; they are planted out in twelve months' time. Loquats, they consider, scarcely pay. The demand is but slight, the fruit on occasions realizing but 1½*d.* per lb. A bed of Dahlias looks well, and is now flowering freely—bushes, 3 to 5 feet high, received from England at Christmas, and planted immediately on arrival. Roses receive special attention. Banksians and Teas do well, and Cloth of Gold bears a good reputation; of vigorous growth, it stands drought and heat. Safrano also can be recommended, but Maréchal Niel is apt to burn.

Good soil is obtained from the Loftz hills, a low range running south of Adelaide; the peat and loam are good, though for Orchids the former obtained from home, is preferred.

On the Loftz range are many nice homes; the climate is much cooler, many plants liable to burn on the plains succeeding in the various gardens attached to the private residences. I may mention that Romneya Coulteri promises well in Messrs. Hackett's nursery.

The nursery of Mr. C. Newman is some 11 miles out; its situation is peculiar. In the narrow and steep ravines of the Loftz range, along the sides of a narrow creek, he successfully cultivates, sheltered from the hot winds, fruit trees, Rhubarb, Veronicas, Daphne indica, Hydrangea hortensis, Roses, &c. At the time of my visit budding Oranges was in operation, the Seville being a favourite stock. The houses are well filled with Ferns, Palms, Crotons, Ixoras, a few Orchids, some in very good condition, one Phalænopsis Schilleriana bearing a leaf 17 inches in length; Begonias, Caladiums, &c., in fact, a comprehensive general nurseryman's stock. The shade-house of Tree Ferns is also a distinct feature. In the fruit plantations, Cherries are very good, and Apples, budded on the blight-resisting Northern Spy, bear fruit freely. When the blight does appear Mr. Newman finds the hot dry wind shrivels it up, with the exception of that in the deeper cracks.

Mr. Sewell is also an important grower: a Bignonia Cherere covering one of his stone chimneys is very noticeable, soft rosy-purple flowers, fully 3 inches long—a most handsome creeper. He obtained a large collection from Japan of Davallia bullata, trained in various forms, but finds they do not last. Grafted Diospyros are also imported, but require eighteen months' acclimatisation to accustom them to the change of seasons. Plants 2½ to 3 feet in height packed in moss travel well. Mr. Sewell's collection of water-plants is particularly good; small square slate tanks are apportioned to each of the more important genera. Recently an expensive importation of Olive cuttings was received from Italy, but scarcely 10 per cent. show any signs of growing; nevertheless, the extraordinary tenacity of life the Olive always exhibits in this colony may seem novel. Stems, 2 to 3 inches in diameter, simply inserted in the ground, never fail to root and grow. The various florist, greenhouse, and stove depôts are well filled with a general collection. *James H. Veitch.*

(*To be continued.*)

latis apice bilobis; racemo paucifloro longiore fractiflexo; bracteis minutis triangulis acutis; sepalo dorsali ovato acuto, lateralibus late triangulis basi cum pede gynostemii omnino connatis subfalcatis deflexis mentum breve formantibus; petalis multo majoribus cuneato-obovatis obtusis labelli lobis lateralibus erectis magnis antice rectangulis, intermedio brevi latissimo reniformi, callo crassiusculo bisulco ex fundo labelli inter ipsos lobos laterales; gynostemio utrinque carinato, carinâ utraque pone androclinium in lobulum producto, dente androclinii postico subulato; polliniis et antheris generis. Kränzlin.*

THE HERBACEOUS BORDER.

PRIMULA JAPONICA.

The coming of this noble and attractive species some twenty-two years back caused a sensation among hardy plant growers at the time; and its complete hardiness was greatly doubted. All this, however, was in time dispersed, as the plants passed winter after winter out-of-doors with impunity from injury. Not only is it one of the noblest species, but its aspect generally and great vigour make it a most desirable plant. Though not very exacting in its requirements, so far as soil is concerned, Primula japonica should be grown in a moist soil to have it in perfection, and a place beside a running stream, or in a very moist shady border, or in groups in the bog garden, just suits it—anywhere, in fact, so long as the roots can reach water; then the plant attains, for a Primula, gigantic proportions. In such positions the plant is a source of delight, giving no trouble whatever to the cultivator, and sending forth its giant flowering stems to 2½ feet high. The purple-crimson flowers are produced in whorls at intervals up the stem, and in consequence the plant is showy for a considerable time. Since its introduction several varieties, varying in colour, have been introduced to gardens, and at the late Temple show Mr. Wilson exhibited a basket of plants in several shades of colour. The plant is readily increased by seeds, which are best sown in slight warmth in January, and grown on quickly the first year. In those instances where the plants are employed for the embellishment of the home garden, it will be found that they make the greatest progress if planted in their permanent position when about three or four months old. I have frequently seen this plant in the ordinary herbaceous border, but invariably it is devoid of its chief and most marked characteristics. A fertile soil will produce a certain amount of vigour in plants in the ordinary border, though this will not compare with plants receiving abundant supplies of moisture.

Polemonium Richardsoni.

This is a very pleasing and useful plant for the border, the rockery, or for cutting, and I see no reason why it may not be freely employed for purposes of spring gardening. It commences flowering when about 8 inches high, and keeps up a continuous supply of its pale blue flowers for a long time. Moreover, the plant is of free growth, elegant in appearance, readily increased by division of the root-stock. Moreover, it is exceedingly accommodating, for it may be divided and transplanted at almost any time, even when in full flower, by cutting it down to within 8 inches of the ground, and in a short time it will break away again into growth. *J.*

GARDEN NOTES.

HONEYDEN, FOOTS CRAY.

Few gardens can show such a wide range in the variety of the plants grown in them as these pretty gardens, in which R. A. Todd, Esq., delights to grow, especially Orchids, bulbous plants, and hardy flowers, and to experiment on such as are considereed difficult, and that too, with great success in many cases. For example, the quantity of bulbous plants which are to be found growing and flowering successfully in the open air here, is remarkable. Some of these are commonly supposed to be stove plants, while others are seldom seen grown other than in greenhouses. Among these we noted quite a large number of Crinums, which have passed several seasons in the open air. Among them were three new species of Crinum, from Eastern tropical Africa, one of which, allied to C. lineare, flowered well last year, and is again sending up two very stout flower-spikes, the plant like the others, grown with it, having been uninjured by the winter, and by what was worse still, the very cold spring which in these gardens as in many others, totally stopped the flowering of most of the hardy Lilies, and swept off nearly the whole of the fruit on the Apples, Pears, &c. Crinum Powellii, and others, were well in flower, and among other rare species here proved to be hardy, we noted C. Mooreanum, C. MacOwanii, C. campanulatum, &c. Ismene calathina and another species were in bloom in the open border, and Ismene Amancaes growing strongly; Phædranassa chloracea in bloom; and P. schizantha and other species growing strongly.

Among the greenhouse bulbs, the beautiful white Lachenalia orthopetala, a very pretty and fragrant species, is in flower. Also the true L. aurea gigantea, L. orchioides, L. pustulata, and L. contaminata; some species of Cyrtanthus, and Hæmanthus; Nerine flexuosa, and other bulbs, and at the end of the house a most beautiful specimen of Disa grandiflora, with stout short flower-spikes, eight in number, each bearing several very large and brilliant scarlet flowers—a plant to be proud of; also a fine specimen of D. racemosa, and in bud, the pretty blue Brownleea cœrulea.

The Orchid-houses contain many rare subjects, and the plants are grown with flowering and foliage plants, not liable to harbour insects. Among these, some good Anthurium Andreanum, Rondeletia brilliantissima, a fine strain of Gloxinias, &c., were in flower, and in the various houses in flower were Cattleya Mendelii varieties, C. granulosa, Vanda Roxburghii, Epidendrum nemorale majus, Saccolabium Blumei majus, S. guttatum, several fine examples of Oncidium Jonesianum, which here thrives remarkably well; Aërides Sanderianum, A. Lawrenciæ, Phalænopsis Schroderæ, and the large yellowish-white P. Micholitzii, a very rare plant; Angræcum Scottianum, and many plants of great botanical interest. The neat little rock-garden has its centre well covered with dwarf alpines, among which the lesser Campanulas are very beautiful; Cistus florentinus and C. crispus, too, are covered with flower; Gentiana septemfida has fine heads of blue flowers; the lesser Dianthus have been good, and still make a show; and Æthionema persicum

forms charming tufts covered with neat heads of blush-white flowers. In the borders around, the Delphiniums, Lychnis chalcedonica, Papavers, Geranium pratense flore-pleno; the taller Campanulas, Roses, &c., make a fine show, and in the sunk garden, where the collection of Oncocyclus Iris, the hardy Cypripediums, &c., are, the species of Lilium promised in spring to make a good display, but the late frosts crippled all the varieties of Lilium canadense, L. pardalinum, and L. Brownii, except where an occasional plant or so has been in a situation which favoured its escape.

THE ROSARY.

AIMÉE VIBERT ROSE.

It is pleasing to note that this old favourite still holds its ground amid such formidable rivals as the new Crimson Rambler. It is the most useful of all Noisette Roses, and may now be seen covering an area of about 600 square feet of the old abbey ruins, behind the fine Norman Tower of Bury St. Edmund's. The plant has occupied its present site on the ruins for a good many years, and has been allowed to ramble high and wide with little restraint from shears or knife. The result was a plant of abnormal size totally smothered with blooms. Rich and superb as it is in and by itself, it needs but little imagination to see how very much its striking beauty might be heightened were it supported on one side by L'Idéal or William Allen Richardson, and on the other by Turner's new Crimson Rambler. Take them for all and all, these are fine wall-clothers, and match rambling Roses, and it seems a pity they are not more frequently employed to scramble over ruins or climb up and clothe old pollards or other trees. For these and other picturesque effects in garden scenes, rambling Roses have few equals—assuredly no superiors, unless it be the glowing Ivy-like Virginia Creeper, Ampelopsis Veitchii. There is abundant room and work for the latter to cover their grey masses at Bury St. Edmund's with fiery crimson in the autumntide, when the pale-faced Aimée Vibert Rose and its more brilliant, though hardly more beautiful, companions have faded. *D. T. F.*

The Improvement of Roses.

Not infrequently one hears complaints to the effect that the modern Roses are not so good as the old ones, especially in the matter of scent. How such an unreasonable impression can have been maintained so persistently is most puzzling. Let these persons carefully examine our old Roses. Whether they take one class or another, there have undoubtedly been vast improvements made, and, I venture to assert, in all directions. Which of them has a richer perfume than Viscountess Folkestone, Heinrich Schultheiss, Madame Cusin, The Bride, Souvenir de S. A. Prince, Dr. Grill, Luciole, or L'Idéale? All of these were introduced since 1880. Do we look for depth of colour in various shades, we can still find improvements produced since the same date. I may name Eclair, Ella Gordon, Lady Helen Stewart, Jeannie Dickson, Mrs. J. Laing, Salamander, Suzanne-M. Rodocanachi, Sir Roland Hill, and Victor Hugo from the hybrid perpetuals; while the same class affords us similar improvements in light colours with Margaret Dickson, Mrs. W. J. Grant, Merveille de Lyon, Marchioness of Londonderry, and Marchioness of Downshire. When we come to the Teas, in addition to those already named, where can we find such exquisite shades as in Cleopatra, Ernest Metz, Ethel Brownlow, Edith Gifford, Madame de Watteville, Sunset, and others? With a glance at hybrid Teas, a few good varieties of which, since 1880, are Grace Darling, Caroline Testout, Augustine Guinoisseau, Lady M. Fitzwilliam, Viscountess Folkestone, Gustave Regis, Bardon Job, and Marquess of Salisbury, we must get further into our subject.

It does not matter which class or section we take, even among the garden Roses, now, happily, coming more into favour, we find a large number of newer introductions which are vastly in advance of the majority of older varieties. Janet's Pride, and the splendid hybrid Sweet Briars coming into commerce through Messrs. Keynes & Co. this autumn, are so great an advance in every way upon the old ones in this class, that one need name no more. Mrs. Paul and Madame Isaac Pereire from the Bourbons; Laurette Messimy and Red Pet from the Chinas; Perle d'Or, Mignonette, and Gloire des Polyantha from the polyanthas; Mme. G. Bruant and America from the Japanese, were all introduced since 1880. But in the matter of greater vigour, hardiness, and more perpetual blooming, we are far in advance of many of the old Roses some sentimentalists sigh over, so many of which were only good for a short period each year, and bore very little of the beautifully handsome shades found in the foliage of the present day.

A collection of the old Gallica, or Damask Roses, staged by the Right Hon. Lord Penzance at the Crystal Palace recently, and also the fact that most of our Silver Medals for the best blooms in such grand representative shows as the National Rose Society hold, give us a wonderful contrast.

Of course, there are some good old Roses—good, too, in every way; but that does not prove that our new introductions are not a decided improvement upon the majority. They are elderly persons who bring forward these notions, and with all due respect to age, I must give it as my impression that they have either neglected to move with the times, or else have an undue preference for the friends of their youth. Finally, does any experienced rosarian doubt that our queen of flowers has really improved as much, if not more than any other flower? *A. P.*

AMATEUR'S COLUMN.

SHIRLEY POPPIES.—It is well known that all the Papaver family are lovers of plenty of fresh air, and do not generally succeed in or around large towns. I have tried an experiment this season, making sowings of all the kinds in cultivation. The most open space available was given each kind, and abundance of manure placed in the ground. Every variety, with the exception of the above-named, absolutely refused to grow, while these are wonderfully vigorous, and a mass of bloom. I have not seen this delicately beautiful queen of Poppies in any of the parks in London; but as they do well here, in the land of factories—Bermondsey, they surely would succeed in parts more highly favoured, and further removed from chemical impurities in the atmosphere. Sweet Peas also do remarkably well. The conduct of different members of one family of hardy perennials is somewhat peculiar. Three plants of each of the following Helianthus were planted last autumn in both of the recreation grounds under my charge: H. semi-plenus, H. Soleil d'Or, H. multiflorus giganteus, H. lætiflorus, H. rigidus, and H. decapetalus. The first four have made abnormally strong growth, while the others are puny and stunted. Chrysanthemum uliginosum spreads rapidly, whilst C. maximum seems very unhappy. All the Asters grow apace, with the exception of A. Shorti, which, by the way, is a very showy variety. None of the species of Lychnis seem to thrive in London smoke. In Calceolarias, too, the same thing exists. It occurred to me that beds filled with Calceolarias would be effective, and a bed in each ground was planted with Camden Hero (crimson) for centre, with Yellow Queen as outer edge; Lobelia for edging. Camden Hero has proved a miserable failure, whilst the yellow variety is a mass of bloom. Tuberous Begonias promise well for bloom, although the foliage is slightly scorched. *W. H. Aggett, Bermondsey, S.E.*

A BEAUTIFUL FLOWER.—Is the "Gloria" as well known and as often grown as it deserves to be? From several seeds brought from Teneriffe, and sown early in February in our Orchid-house, only two plants have reached maturity and the perfection of loveliness. These two, when about 3 feet high, were changed into a cooler house, where they have grown tall and strong, sending out long climbing shoots, well furnished with buds and leaves, and where, on June 30, one of them displayed its first flower, like a very large, delicately-formed Convolvulus, of a most marvellous cœrulean blue, with golden-yellow deep within the long tube; anything more exquisite in form and colour can hardly be imagined. Since that day from eight to ten flowers have unfolded daily. Alas! the Gloria is as transient as it is lovely, and its beauty lasts for only five or six hours; seven hours, may be, in dull weather. Yet I have seen it live in all the splendour of its freshest, purest azure and gold from 8 till near 3, when cut and placed in a glass of water at a distance from the window. *E. V. B., Huntercombe Manor.* [Our correspondent's description refers to some Ipomœas, probably I. purpurea, which deserves all the praise lavished upon it. Ed.]

PLANTS IN FLOWER AT EDINBURGH BOTANIC GARDEN.

Combretum purpureum.—This tropical climber, seldom seen in good condition, is now flowering on the roof of the annexe of the Palm-house, and its rich scarlet flowers, borne in branched panicles, are much admired.

Myrtus Luma.

A fine plant of this Chilian species, about 7 feet high, is flowering profusely in the Temperate-house, the deep green of the foliage, where it can be seen amongst the innumerable white flowers, making a fine contrast. The leaves are small and ovate, the branched pedicels bearing the flowers springing from the axils of these. The petals are slightly concave, and the large number of stamens upon short filaments give them a light appearance. The synonyms of Eugenia apiculata and E. Luma have been given it by different authorities. A figure of this plant is given in the *Bot. Mag.*, t. 5040, under the latter name.

Callistemon salignus and C. speciosus.

Two handsome greenhouse plants, have for some time been flowering freely, their bottle, brush-like inflorescences being very attractive. The first named is very floriferous, and the straw-coloured flowers have a peculiar odour. C. speciosus is perhaps the more showy species. Both are capital greenhouse plants.

Melaleuca hypericifolia.

This plant resembles somewhat in the appearance of the inflorescence the Callistemons, but its habit of growth is not so rigid, and the branches are more pendulous. The flowers are of a brick-red colour, and are borne in crowded cylindrical spikes, these springing some distance from the points of the branches appearing very freely. The plant here is about 9 feet high, and occupies a front position in a bed in the Temperate-house. *R. L. Harrow, Royal Botanic Garden, Edinburgh.*

RURAL INDUSTRIES IN CAMBRIDGE.

One of the oldest and most prosperous of these celebrated its majority at Histon recently. It was a happy coincidence that brought this event into the week of one of the most successful meetings of the Royal Agricultural Society of England at Cambridge, for Histon is nigh to Cambridge, and is a well-known station on the Great Eastern and Midland line from Cambridge to St. Ives.

To those interested in the extension of fruit-growing in England, it is better known as the centre of the jam factory of Messrs. Chivers & Sons. It is twenty-one years since the first boil of jam was made by the firm.

The meeting was presided over by Mr. S. Chivers, supported by his three sons, and Hugh E. Hoare, Esq., M.P. for the division; the staff of travellers, *employés*, and friends, amounting to about 400. A capital tea was provided in a large tent, music and games were also provided; while the large group was photographed during the evening. The Press was also well represented, so that to those who can read between the lines of the full report of the great show week at Cambridge, there will be few more hopeful or suggestive incidents than the account of the rise and progress and coming of age of this first jam factory in East Anglia.

The chairman and founder, who received a most cordial welcome from his *employés* and friends, stated that he commenced business with 3 acres of land; within ten years this was increased to 150 acres. They began with two workpeople, now they had 400 workmen, and 500 acres of land. The chairman added, "I believe there are now within ten miles of this factory 3000 acres of fruit, 2000 acres of which have been planted since the factory was built."

Twenty-one years ago the factory was built to meet the difficulty that confronts the fruit-grower who largely increases the production of a perishable commodity on a large scale. As the Histon acreage increased, and Mr. Chivers and his sons went down to Bradford in Yorkshire, chiefly to dispose of it, the necessity of a factory was borne in upon them. "Beyond this the excellence of the product, and the interest of the *employés*, from the highest to the lowest, have powerfully promoted the prosperity of the firm; the foremen of our fields and gardens have been with us over forty years, and many of you have been with us for twenty and thirty years," observed the chairman at the meeting, who was also able to add, "we have scarcely had any trouble with our workpeople. Some of the happiest years were those I worked with my own men." The chairman's sons addressed the meeting in a similar genial and friendly spirit.

The freshness and high quality of the jams, made the same day as picked, has also done much to promote the prosperity of the firm. "At our factory," observed Mr. John Chivers, "we make a special point of getting the soft fruits, such as Strawberries and Raspberries, boiled up and filled into pots ready for consumption the same day as picked, sometimes in the busiest season, by the help of relays of the workpeople, and by running our pans continuously from early morning until late at night, thus preserving the fruit with all its freshness and bloom, and producing a result which can only be obtained by this means."

Mr. Hoare, the M.P. for the division, congratulated the meeting first of all on two things, the good order and cleanliness that prevailed in every branch, and the general contentment among the *employés*. As a proof of the importance of such village industries, Mr. Hoare dwelt on the fact that Histon is one of the few villages in West Cambs where the population has not gone down, but has on the contrary increased. "Therefore we owe a debt to the factory that can hardly be over-estimated, and not only does this neighbourhood owe a debt of gratitude to the factory, but the whole county also for the example Histon has set, and which I am glad to see has been followed elsewhere with equally beneficent results. Some eight or ten years ago an illustrious statesman advised the English farmers to produce jam. That advice, if I may use an Irishism, had been taken long before it was given, because ten years before Mr. Gladstone gave that advice, the work had been begun at Histon, and not only is the operation of jam-making and kindred manufactures carried on, but this factory found employment also for carpenters, printers, tin-workers, and other industries. This jam is like the best home-made jam; it is cheap, but not impossibly cheap. It is only cheap so far as cheapness is compatible with a first-rate product; and I can only say," concluded Mr. Hoare, "that I never had in all my life better home-made Strawberry jam." Mr. Hoare wondered what sort of tents would be needed to receive the *employés* in twenty-three years time, when the factory will have been in existence for half a century, if it is carried on in the same spirit and on the same lines as it is to day.

To other districts, and especially those suffering most from the present agricultural depression, we would repeat the advice of England's greatest statesman and the Messrs. Chivers, the first practical fruit-growers who have tried jam with such distinguished success. *D. T. F.*

Fig. 14.—Disa veitchii ×.

DISA VEITCHII ×.

In this beautiful plant, obtained by intercrossing D. grandiflora and D. racemosa, Messrs. Jas. Veitch & Sons, Royal Exotic Nursery, King's Road, Chelsea, produced the first, and still one of the best, of the new race of garden hybrid Disas, which are destined to become general favourites, as they give a class of terrestrial Orchids with most beautiful flowers, which do not require to be grown in an Orchid-house, as they thrive remarkably well in a shady corner of an ordinary greenhouse or conservatory, if they are carefully tended and kept always moist, rain-water being used for them in preference to water from any other source. The flowers, which last a long time in perfection, are rose-purple, with dark crimson and yellow markings in the centre.

NURSERY NOTES.

SOME ROSE NURSERIES.

Mr. Frank Cant.—No one professing even a limited knowledge of the world of Roses, could make a more unfortunate admission than that he was unacquainted with the names, at least, of Cant's, of Colchester. For several years past, if we except especially early seasons, the first position in the leading class at the Crystal Palace shows has been held by one or other of these Colchester firms, nor has the present year been any exception, for at the southern shows generally, it has been an in-and-out race between the Cant's. Mr. Benjamin R. Cant scoring in the class for seventy-two at Windsor, and Mr. Frank Cant at the Palace. Essex is a real Rose county, especially around Colchester, and only 18 miles away, in

*

the neighbouring county of Suffolk, is the garden of that redoubtable amateur champion, the Rev. H. A. Berners, of Ipswich. Why East Anglia has obtained such an enviable reputation for the culture of the "Queen" has been answered in various ways. Some have said the nature of the soil has been the chief help, others that the secret is to be found in the air or climate. Either or both of these very important circumstances may have had much to do with it, but these natural conditions have been greatly assisted by the skill, enterprise, and energy that have been brought to bear in the matter of their culture, such as is only practised in so large a degree by growers who love the plants under their charge. It may be said generally that a gardener seldom succeeds in the culture of a class of plants that does not commend itself to his favour. When recently paying a short visit to Mr. Frank Cant, we had the pleasurable experience of seeing these acres of Roses at the most interesting season of the year, for—with few exceptions—the rows of plants were covered with particularly fine flowers, and in such abundance that the air seemed to reflect the varied and enchanting hues they presented, and to be filled with the sweetness of their perfume.

The nursery is something over a mile from the station, and Mr. Frank Cant and his assistants were extremely busy preparing stands for the exhibitions at Wolverhampton and at Gloucester. The nursery consists of about 45 acres of land, lying on the opposite side of the road to Mr. Cant's residence. The situation is good, the whole area slanting down to full south, and on the east side the greater part of it is considerably sheltered by a belt of tall trees.

The first variety we noticed amongst comparatively new kinds was the seedling from Madame Gabrielle Luizet, known as Madame E. Michel. This fine H.P. was doing exceedingly well, and its large full flowers of very bright rose, and good form, are a decided improvement in colour and in form upon the parent. Violet Queen was easily noticeable, but although it may live for some time, it is not likely to become a favourite. Charles Gater is a grand brown-crimson-coloured flower of good shape. Mr. Cant thinks this variety will prove a capital plant treated as a cut-back, and it is a splendid grower. Then there was Marchioness of Londonderry, an immense flower of ivory-white; the petals are of good substance, and a little reflexed, whilst it has a pleasing amount of perfume, which in many of the newer kinds is lacking. Madame Joseph Bonnaire, a new one in the way of—and suspected to be a seedling from—Paul Neyron, is bright rose, flowers very large; it is somewhat distinct, from the reverse of petals being a silvery-white. Mrs. Harper was noticed reverting to Heinrich Schultheiss, some of the flowers being half-and-half, from which it may be supposed the variety will not be long-lived. General Berge is a capital crimson or deep-red flower, with a shade of violet in the older petals. It is free-blooming and sweet-scented, the flowers are large and pleasing. Then there was Mrs. Paul (Messrs. Geo. Paul & Son), a good light-coloured variety, and very distinct. Margaret Dickson has done splendidly everywhere this season, and was awarded 1st place at the Crystal Palace in the class for the best new H. P. It would be white were it not for a delicate flesh centre; the petals are large and pretty, and seeing also that its foliage is handsome, and it is proving itself a good grower, this introduction by Messrs. Dickson & Co. of Newtownards will be a general favourite.

Whilst speaking of the newer varieties, it may be well to notice a new single or semi-single garden Rose, a seedling of Mr. Cant's which he intends to call Braiswick Seedling. In colour it is almost equal to Duke of Edinburgh the flowers are very large, and wonderfully free, and it is a strong grower. The new double or semi-double rugosa, named Double de Coubert, is an acquisition, in the way of a pure white garden Rose.

It is unnecessary to say that all the standard varieties were to be seen in this establishment, and in capital condition, but we shall refrain from mentioning any large number of them, as they are well known. It is interesting, though, to remark how plainly is it evident that each variety requires more or less different environment, and so we find that in one season this variety is perfect everywhere almost, and another—generally a good sort—is a failure. As an instance, may be cited, Mrs. Jno. Laing, capital this year almost universally, last year it was bad; whilst Madame Gabrielle Luizet is generally inferior this year, and last year it was good.

Viscountess Folkestone, one of the best hybrid Teas, is nearly always in bloom, and its flesh-colour is very pleasing; Horace Vernet, dwarf, as usual; Lady Alice Fitzwilliam, and General Jacqueminot, the latter one of the best of Roses, producing no end of bloom, were all doing well. A large quantity of maiden plants of A. K. Williams had made splendid growth, and scarcely any of them had failed to "take." Pride of Waltham (W. Paul & Son), in habit like Countess of Oxford, is a fine Rose, but has now been known well for more than a dozen years, and requires no description here. Marie Baumann was lovely, and Fisher Holmes, Earl of Dufferin, Prince Arthur, Reynolds Hole, and others, all claim mention; the latter variety Mr. Cant has grown largely, and he exhibited a dozen good blooms at the Palace show.

Coming to a few words upon the Teas and hybrid Teas, the experience here is that common elsewhere, the finest blooms for exhibition are those produced by the standards. May Rivers is a wonderful flower, it contains such a quantity of petals, but we fear it will never be one to be depended on; it requires very exceptional treatment, and, as it were, helping out of its bud, otherwise it would be a very pretty and good sort. Kaiserin Augusta Victoria, a pure white bloom with yellow centre is thought highly of; it is good for many purposes besides exhibition. Maman Cochet is not yet secure in its reputation, but anticipations are entertained that it will be good and useful; it has plenty of substance, and in colour is flesh, but for a little carmine. Ethel Brownlow is a capital bloom when good, but being extremely variable, "Ethel" cannot be depended upon always; it is, however, good for pots and forcing. Mr. Cant is growing a quantity of pot plants of different varieties, intending to further develop this part of his business. As so much depends upon the conditions of the stocks for this year's working, when the Roses for next season are considered it may be interesting to record that a whole breadth of standard Briars exhibit unusually good health and vigour, which could hardly be surpassed, the dwarfs being of equally satisfactory quality.

Mr. Benjamin R. Cant.

The nursery of this veteran grower is about the same distance from the station as that of his nephew, but in a slightly different direction. Mr. Benjamin Cant has been thoroughly well known for years as a successful exhibitor, and although he is less able to get about, and to visit the shows in different parts of the country than formerly, his love and interest in Roses are as keen as ever, though his sons have to take much of the work and management that was the personal charge of their father. The site occupied by this nursery is the highest in or around Colchester, and Mr. Cant told us that the floor of his house was on a level with the parish church steeple in the town. Notwithstanding this altitude, water abounds immediately under the surface, so much so, that it proves a nuisance. However, Mr. Cant well understands the nature of the ground, and knows equally well how to manage it, consequently he is able to grow and exhibit such flowers as he showed at Windsor, and again at the Palace this season. Unfortunately, we were caught in a very violent storm whilst approaching Mr. B. Cant's establishment, and the deluge of rain prevented us from seeing and noting the Roses so carefully as might have been desired; indeed, Mr. Cant was afraid that if we ventured into the fields at all we should remain fast in the mud, but this, we are thankful to say, was not our experience, though the state of a Colchester Rose-field, with its heavy, almost clayey, soil, after such a storm, is not easily exaggerated. This incident, besides preventing a closer inspection of this nursery, was equally successful in preventing us from a visit to that of Messrs. D. Prior & Sons, another Colchester firm which is rapidly making a name for itself at many of our best exhibitions.

Looking at Mr. Cant's plants of Marchioness of Londonderry, we thought that it may prove more valuable than now when it has been longer under cultivation. Mrs. Harkness had good-sized flowers, but they were rather thin; however, it was thought that it will improve. Captain Hayward was thought a good deal of—it has a high flower, stands well, is a good colour, but perhaps rather thin; the colour is violet-rose, and it will make a good one for exhibition. There were large breadths of Victor Hugo, La France, Gustave Piganeau, Merveille de Lyon, and many others, all in capital health and flower; also the very large handsome Prince Arthur, one that was introduced into commerce by Mr. Benjamin R. Cant. The Teas and hybrids, usually shown well from here, are not quite up to form this year, especially the standard trees. Altogether, there are from 300 to 350 varieties of Roses, including a good number of all the best sorts of climbing and other groups. Of stocks, Manetti and Briar, there are about 10 acres to be budded this year; they are of promising appearance, especially the dwarfs. Mr. Benjamin Cant, like his nephew, was busy packing for Wolverhampton and Gloucester, and the storm above referred to would have been disastrous had not some of the blooms been already secured. As it happened, however, there were many yet to cut; but, in the end, Mr. Benjamin Cant won 1st place at Wolverhampton in the class for seventy-two flowers.

Mr. Rumsey.

A well-known grower and exhibitor of Roses is Mr. Rumsey, Joyning's Nursery, about a mile from Waltham Cross Station. Visitors to the shows in spring and early summer will be familiar with the splendid flowers, especially of Niphetos, that were grown here, and the houses are now filled with specimens that not many weeks since were covered with flowers. But if pot plants are a feature, large breadths may be seen in the open ground, the plants in vigorous condition and full flower.

Of recent years no class has come more to the front than the Teas, and it is interesting to note that whilst a large portion of the stock is upon the seedling and cutting Briar, not a few are on the Sweet Briar, which Mr. Rumsey finds valuable for the Tea Rose. We class here Teas and hybrid Teas together, for there is only a very fine point of distinction between them, except in a few instances. A good variety for colour is Souvenir de Wootton, the plants in their second blooming being full of bright rosy-crimson flowers of strong fragrance. It is one of the most sweetly-scented of all Roses, and this feature is of great importance at a time when not a few of the newer Roses are without perfume. Very beautiful was Narcisse, a variety little known compared to some of the others, but of delicate yellow colour, a Rose grown years ago in gardens, and quite able to compete with kinds of similar shade. Excellent were Catherine Mermet, Madame Cusin, the delicately-tinted Madame de Watteville, and such hybrid Teas as Countess of Pembroke, Viscountess Folkestone, and Grace Darling, three splendid Roses raised by the late Mr. Henry Bennett of Shepperton. The first of the three is less known perhaps than the others, the flowers being full, soft rose in colour and sweetly-scented; whilst Grace Darling is one of the most free-flowering and vigorous of all Roses, the plant remarkably robust, smothered with large full flowers, creamy-white, shaded with rosy-peach. Viscountess Folkestone is a hybrid that should be grown in the smallest collection. It is a lovely flower, large, informal, and creamy-white, touched with a refined salmon-pink, a vigorous plant, bushy, and very free. A group of it in full beauty is in its way unique. Mr. Rumsey grows it with success, several plants of it together being very beautiful. Rich in colour is Souvenir de Thérèse Levet, the darkest of all the Teas, the flowers deep crimson and effective.

All the sections of the Rose are grown, and an old-fashioned walk of hardy flowers and Roses is interesting, for the fine old bushes of various kinds that vie with the Poppy and other things for colour. A fine example of the garland hybrid Musk Rose was in bloom, and it would be well if more thought were given such types. This covers a pillar or rustic stake with its rambling growth almost hidden at this time by a wealth of white flowers, yellow in the centre.

A bank of dwarf hybrid perpetuals was very fine, all the chief varieties being grown. Worthy of note amongst them was General Jacqueminot, or "Jacks" as it is called in the market, which if one of the oldest of the section is still popular for its brilliant colour, fragrance, and freedom. Beauty of Waltham was excellent, its bright colour and fragrance, making it of value; whilst we were also pleased to see those two Irish-raised Roses, Margaret Dickson and Jeannie Dickson blooming abundantly. These, especially the former, will take a leading place in the list of H.P.'s. Margaret Dickson was shown well at the recent Crystal Palace show, and it is certainly a variety that grows very quickly and strongly, bearing abundance of sweet-scented, full, pleasing flowers, white, tinted with rose in the centre. Those of Jeannie Dickson are high-centred, pinkish-rose, and sweet. Duchesse de Vallombrosa is a variety none too common, but there is a charm in the refined rose-coloured flowers, and the plant makes a robust, bushy growth. Ulrich Brunner, like Gustave Piganeau, was a Rose that came to the front very quickly. It makes a splendid display here, Mr. Rumsey bending over the strong shoots, flowers being sent up at almost every eye; the rows of it are a mass of bloom. This is a good year for the dark and velvety-crimson Roses, such as Crown Prince, Prince Arthur, Duke of Fife, Duke of Wellington, Xavier Olibo, and many others one could name. When well grown and the season is not too hot, nothing is more beautiful of its class than this, the flowers so rich in colour, and as a rule, powerfully fragrant. We saw two sports here of a climbing habit, one from Earl of Pembroke, and the other from Star of Waltham, both of vigorous growth; whilst in the former instance, the flowers appear fully three weeks earlier than those of the parent, and in the other case they are lighter and of better shape. Suzanne-Marie Rodocanachi is a thoroughly good garden Rose; its rosy-coloured flowers are bright, sweet, and produced freely on strong vigorous plants. It is one of the best Roses this season, and many fine blooms of it have been exhibited.

FIG. 15.—RUBUS JAPONICUS TRICOLOR: VARIEGATION PINK, WHITE, AND GREEN. (SEE P. 96.)

In a fine stretch of maiden plants we noticed a highly promising sport from Mrs. George Dickson, the flowers of delicate colour, rose, deepening in the centre, and borne freely on strong-growing plants, noticeable for their splendid leafage, and as in the case of the type, completely free from mildew. Although varieties associated with it were affected, this was untouched. Of course, that fine Rose, Mrs. John Laing, was flowering with its wonted freedom; and a variety interesting to mention is Marguerite Boudet. A superb bloom of this gained the Silver Medal for the best hybrid perpetual in the amateur's section at the recent Crystal Palace show, but it is seldom one sees it in such condition. Unfortunately, the plant is not a strong grower, but the flowers are distinct in their lilac-tinted colouring. A really good garden Rose is Augustine Guinoisseau, which has not been inaptly called the white La France, the plant making bushy growth, the flowers white, delicate rose in the centre, and very fragrant. It is a good autumnal as well as summer Rose.

A very fine plot of standard and half-standard Roses is a feature of this nursery, and every variety adapted for this mode of culture is grown. It is not necessary to give a list of names, never very interesting, as only those varieties that form really good heads are grown. The reason why this form of Rose has become, to a certain extent, unpopular is because kinds utterly unsuitable for making standards have been selected. Moss Roses, Austrian Briars, and allied types, the Polyanthas, Chinas, and other important sections were all represented by the best varieties. *Visitor.*

MESSRS. SALTMARSH & SON.

The nursery of Messrs. Saltmarsh & Son is just outside the town of Chelmsford, but within a mile or so of the railway station. It is a typical country nursery, containing a little of everything, with a special development of certain departments. Good order prevails, and, as is always the case under such circumstances, the plants have a healthy, well-to-do appearance. Zonal Pelargoniums and Begonias make a brave show, Mr. Saltmarsh having evidently an excellent strain of both. Small plants of Palms, Dracænas, Crotons, Adiantums are in profusion; and in one of the houses a fine bush of Streptosolen Jamesoni seems to invite the passer to cut and come again. The method of shading of some of the houses is worth noting, as it is efficient, inexpensive, and convenient. It is simply a light hurdle in the shape of an ordinary light, with rather wide interstices between the bars. This allows the light to penetrate, but breaks it up and prevents scorching. The hurdles are removable by a lad with great ease. In the grounds are some noteworthy trees, such as a fine specimen of Cedrus atlantica glauca, perhaps the finest silver-leaved Conifer. Almost equally beautiful is Abies nobilis glauca. A cut-leaved Lime and various other ornamental trees make the visitor wonder at the way in which these interesting subjects are ignored.

Roses are largely grown; but so much has been said about Roses lately, that it is difficult to find anything new to say about them. A nice quarter of standard Mulberries, in excellent condition, is not so often met with; indeed, one of the specialties of this nursery consists in its collections of well-grown fruit-trees—Apples, Pears, trained Peaches, standard Plums, and the like. Some of the young Apples showed traces of that dreadful May frost; but on the whole, the trees are in excellent condition, the bark clear and bright, and the foliage healthy. On the Paradise, the crops are good; and amongst Apples, special note must be made of Saltmarsh's Queen, which this season is bearing profusely. Pears on the Quince are also remarkable for the crop of fruit they are this year bearing.

RUBUS JAPONICUS TRICOLOR.

THIS is one of Messrs. J. Veitch & Sons' introductions (fig. 15, p. 95), and was shown by them at the meeting of the Royal Horticultural Society on July 10 last. As seen it was a slender-growing trailer, with stems and leaf petioles of rose-colour, the leaves showing much white in patches among the green of the rest of the leaf surface, the youngest leaves being pinkish-white. It would make a pretty greenhouse climber, or basket-plant; or, layered in small pots, a very suitable subject for table-decoration. We do not know if it is yet in commerce.

MARKET-GARDENING IN SUSSEX.

THE season, on the whole, has been a disappointing one, as far as it has gone. A dry and brilliant spring, from March to mid-April, brought all fruit and vegetables very forward, and had the fulfilment realised the promise, the season of 1894 would have been a remarkable one. Never have we seen a better or more abundant show of bloom on Pears, Apples, and Strawberries; seldom a better promise of a large crop of black Currants; Potatos looked well, and were unusually forward; Peas, too, promised great things. When, on the night of Sunday, May 20, a sharp white frost came upon us, the havoc wrought may be more easily imagined than described. In our own district we registered about 6° of frost, but in some low-lying parts 8°, and even more, were noted. Kent suffered very considerably, and most dire accounts of the damage done by the frost soon reached us from our sister-county. For a time, we were deluded into hoping that our loss was comparatively trifling, but a few weeks suffice to prove the fallacy of such hopes. The Apple crop has become practically a complete failure; Strawberries are yielding less than half a crop; black Currants have dropped very considerably; Potatos on the higher ground checked, but not otherwise injured, are in low-lying parts cut to the ground. The Pears, being a week or two in advance of Apples, have not suffered much, and there is, in our own district of East Sussex, a fair promise of a crop; we notice, however, that the fruit is not swelling well, and seems to be cracking considerably. We have had a good deal of blight, and caterpillars have, until lately, done serious damage to the young foliage. Plums are only a moderate crop, and are a good deal blighted. Gooseberries have suffered a little from caterpillars, but are quite an average crop. Peas have, perhaps, best of all fulfilled their early promise, and have yielded well. Beans, both dwarf and runners, have been looking very yellow and unhealthy, owing, probably, to the cold nights we experienced during the latter part of May and early June, but a fortnight of really warm weather has improved their appearance in a marked manner. This should be a Celery year, the abundant rains giving it a good start, and never allowing it to flag.

A curious feature of this season has been the lack of demand for flowers. Since the Wallflower season was over, the demand for perennials and herbaceous plants has been practically nil. Really fine Pinks (Her Majesty) have been almost unsaleable, and Roses a drug in the market. We can only account for this rather unusual "slackness" in the flower trade by suggesting that the wet, cold spring and early summer—for with the exception of a few weeks' hot weather this month it has been a dull season—has kept the usual visitors away from such favourite resorts as Tunbridge Wells, Eastbourne, and Hastings, and rendered even the residents chary of indulging in luxuries. There is now a fair demand for Sweet Peas in limited quantities.

Under glass, in spite of an insufficiency of sunshine, the Tomatos look well, and seem to promise a heavy yield. We have seen no sign of mildew up to the present, but deem it wise to withhold water whilst the dull, wet weather lasts, as far as is possible consistently with the growth and well-being of the plants.

A few notes as to wholesale prices realised in one or two of our large towns at this present time may be of interest:—Tomatos, 6*d*. per lb.; Peaches, 2*s*. per dozen; Strawberries, 4*d*. to 5*d*. per lb.; Gooseberries, ripe, 8*s*. per bushel; red Currants, 8*s*. do.; black Currants 6*s*. to 8*s*. do.; Raspberries, 10*s*. do.; Potatos, kidneys, 4*s*. to 5*s*. do.; White Hebrons, 4*s*. do; Peas, William I. and William Hurst, 4*s*. do.; Ne Plus Ultra, 4*s*. do.; Cauliflowers, 1*d*. and 2*d*. each; Cabbage, 6*d*. per dozen; Carrots, 1*s*. 6*d*. per dozen bunches; Turnips, 1*s*. 6*d*. to 2*s*. do.

Flowers: Pinks (Her Majesty), 6*d*. to 1*s*. per dozen bunches; Sweet Peas, 2*s*. do.; Gladiolus (white), 1*s*. do. (six blooms to a bunch).

The weather continues wet and cold, and the markets are proportionately dull. *A Market Gardener.*

BELGIUM.

THE ANTWERP EXHIBITION.

THE manifestation organised by the horticultural section of the Exposition Universelle and the Royal Agricultural Society of Antwerp was successful, though the King and Queen, in whose honour it was organised, were unable to be present owing to the death of President Carnot. So many plants and flowers were received that they furnished a *salon*, which was arranged under the superintendence of M. Guillaume Bosschère. The plants included, among others, tuberous Begonias, blue Ageratum, white Sedum carneum, Anthurium Scherzerianum and A. Rothschildianum, Orchids (among the finest were those from MM. Ch. Vuylsteke, D. Massange of Louvrex, Peeters, Pauwels, Van Imshoot, Jules Hye, A. Janssens, and L. Vincent), Nidularium fulgens and N. Meyendorffi, Ophiopogon jaburan, fol. var., Dracæna, Saxifraga sarmentosa tricolor superbs, interspersed with many fine Palms, among which may be mentioned the specimens of Kentia from M. Vuylsteke, Kentia Forsteriana from MM. De Smet Frères, Rhapis flabelliformis from M. Peeters, Latania borbonica, Cocos Weddeliana, and Chamærops excelsa.

ORCHIDS, &C., AT ANTWERP.

Among the Orchids employed at the Royal manifestation at Antwerp we may mention the new hybrid Cypripedium raised by M. Jules Hye, C. Leysianum (bellatulum × Crossi), which obtained a First-class Certificate when exhibited in London; also C. Baron Osy, the inferior sepal of which is the duplicate of the standard, a characteristic which will be permanent, since two seedlings have exactly reproduced it. This feature may prove the starting-point of difference of a new series of remarkable hybrids.

The international exhibition of cut flowers, plantes d'appartement, and floral decorations, was a successful one. Fine plants were sent by M. Emile de Cock, of Ghent, some good Heuchera sanguinea by M. Truyman, herbaceous Ferns from M. Ad. Vandenheede of Lille, forced fruit by M. An. Cordonnier of Bailleul (France), new Cannas by M. Pfitzer of Stuttgart, and a fine collection of tuberous Begonias by Messrs. John Laing & Sons of Forest Hill. Though unfortunately somewhat injured by heat in transit, a Gold Medal was awarded for this exhibit. There were also shown some fine cut Roses from M. Henry Vanderlinden of Antwerp, and Baron de Coels of Brussels; the cut flowers from Madame Jean Everaerts of Antwerp were much admired.

BELGIAN PRESS CONGRESS.

The members of the International Press Congress, which met at Antwerp in July, were received at Laeken by the King and Queen and Princess Clementine. The visitors inspected the royal gardens and greenhouses, which they greatly admired. The event tends to show once more the great interest which His Majesty takes in horticulture.

THE WEEK'S WORK.

FRUITS UNDER GLASS.

By BAILEY WADDS, *Gardener, Birdsall Gardens, York.*

CUCUMBERS.—Plants growing in deep pits and bearing heavily should have a good supply of liquid manure-water afforded them about once a week, and be well syringed twice or thrice daily, at the same time keeping the air laden with moisture. The leaves should be frequently syringed with quassia-water to kill the white aphis. Remove decaying or very old leaves, thin-out the bine freely at short intervals of time, and stop the shoots at every three or four joints, but do not cut away the leaves on shoots where fruits are growing. Cucumbers in dung-bed frames should have fresh lining put to the frames, the night temperature being kept at about 70°, and that by day at 80°, but the amount of sun-heat will be the ruling factor. During the present month cuttings may be struck, and seed sown for late supplies, following these with sowings in August and September.

STRAWBERRIES FOR FORCING.—The potting of runners as soon as they require it, should receive attention. After potting, place them on a bed of coal-ashes with a path at every fourth row, and in an open place, moving them at short intervals to keep the roots out of the bed. Runners layered in fruiting pots should be taken from the beds as soon as sufficiently rooted to be freed without flagging.

VINES.—Stop the laterals and regulate all shoots that are to remain on the canes, taking care that by so doing the bunches are not fully exposed to the sun's rays, leaf shade being very essential to the swelling and colouring of the berries, but not making the shade too heavy. The so-called "scalding" of berries by the sun is often taken to be "spot," a fungoid malady not often seen in well-ventilated vineries, and which may be kept under by a somewhat dry atmosphere, and by damping the hot-water pipes, and at once dusting them with flowers-of-sulphur. At this season much attention should be given to the watering of the Vine-borders, inside and outside, the latter not being left to the chances of rainfall, affording both frequent dressings of Vine-manure at watering time. No hard-and-fast line can be laid down in this matter, but tests may be made to ascertain as far as may be the condition of the soil at various depths. A thorough watering may be applied to borders inside the vineries once in three weeks, and those outside in the present fickle season will, in low-lying situations, and where the drainage is believed not to be good, require much care in not affording more water than is actually required. Too much water applied in such cases leads to many evils, such as checks to growth, shanking, and mildew. Borders in bad order will require renovation at the proper time, and preparations may now be made, so that no loss of time may occur. If mildew appears, apply artificial heat and if it is an early vinery, the fruit should be removed, and the foliage syringed with some efficient mildew composition. If red-spider infests the foliage of Vines with ripening fruit, nothing can be done effectually against this plague before the bunches are removed. Having done this, use petroleum emulsion or Lemon-oil on alternate days, water alone being used between times, making use of the garden engine or a powerful syringe. Some gardeners use dry sulphur against red-spider, but it has no effect on the insect, and nothing is more disagreeable than to find flowers-of-sulphur in the bunches or on the foliage. The best way to keep the insects in check is by maintaining the borders in a healthy condition as regards moisture, over-abundant moisture being as bad in its effects as drought. This cool season artificial warmth and a free circulation of air will be necessary in the early vineries after the fruit is removed, on sunny days throwing open all sashes, but not starving the vines by much exposure in cool weather; the temperature in the late Muscat and Alicante vineries may range from 70° by night to 80° by day, with a small quantity of ventilation at all times.

THE ORCHID HOUSES.

By W. H. WHITE, *Orchid Grower, Burford, Dorking.*

CYPRIPEDIUMS.—Such dwarf growing species as C. niveum, C. concolor, C. Godefroyæ, and C. bellatulum have for some time past received much attention from hybridists, and when the crosses raised are possessed of vigour and free-blooming qualities, they should be added to collections. The crosses often bloom more freely than the parents. C. niveum and C. concolor often give more trouble to the cultivator than all the rest of the Cypripediums, and when once they get into an unhealthy condition, it is difficult to restore health. One of the chief causes of ill-health is a close and heavy compost; for growing as they naturally do in hollows and on the surface of limestone rocks the plants do not remain healthy when natural conditions are much disregarded. All of them prefer the warm moist East India-house, and a position where the foliage will be near to the roof, and slightly shaded when the sun is bright. As regards the potting of these species, it should not be done oftener than is necessary, for no

matter how carefully the work is done, a few roots are sure to be injured, these being very brittle; and the bad results of injury to the roots are more felt by them than by others. The proper time for repotting is a few weeks after flowering. The pot in which a plant is growing should be broken by a tap from a hammer, and the stale materials carefully picked out from among the roots, but leaving the drainage untouched if it be permeated with roots. In some cases it will be found that the fine soil will have filtered down amongst the crocks, and this may be blown out previous to repotting if the plants are dry, as they should be. Having done this, place the mass entire in a larger pot, filling up to about two-thirds of its depth with pieces of chalk or limestone, and if these are not obtainable, with broken bricks or thick crocks. Pot moderately firm, using the following compost: good fibrous loam freely intermixed with small nodules of limestone, &c., and a small quantity of sphagnum moss. It is not necessary or advisable to raise the plants above the rim of the pot, for if kept level with it they will do just as well. These species should be kept well supplied with water at all times, especially when in full growth. Instead of watering them in the ordinary way, I always have them stood in a pail of water, the water just covering the surface of the compost, and allow them to remain therein for several minutes. The plants should be taken down and examined two or three times a week, to ascertain that the compost is sufficiently moist. During the summer months some growers stand them in shallow pans in about an inch of water, and I am told the plants luxuriate under this kind of treatment. It is necessary to sponge the foliage occasionally, but in doing so great care must be taken not to break the very brittle leaves.

THE HARDY FRUIT GARDEN.

By T. TURTON, *Gardener, Maiden Erlegh, Reading.*

THE RASPBERRY.—Soon after the bulk of the serviceable fruit is gathered, remove the fruiting canes of this year, so that the young canes may grow vigorously, and also cut out most of the weak canes and the brood that will not be required for planting purposes. For tying to the stakes, select four of the best-placed and least-damaged canes, fastening them loosely, and taking pains not to damage the foliage. This applies to the summer-bearing varieties, Fastolf, Baumforth's Seedling, Prince of Wales, Red Antwerp, &c.; whilst the double-bearing varieties, of which Superlative is a great acquisition, must be kept netted over where blackbirds are troublesome.

PEACHES AND NECTARINES.—The moist weather having been favourable to growth, the mid-season and late varieties should have all required shoots laid-in, cutting back strong ones to a lateral near the base, also to be laid-in. See that all the fruits are exposed as much as may be desirable to sunlight, cutting off or putting aside the leaves. Sometimes the fruits must stand clear of the wall, and this may be done by placing pieces of lath behind them. The demands on the roots being the greatest when the fruit is growing fast, trees that are heavily cropped must be watered with about one-sixth liquid manure if strong, and five-sixths clean water. After the fruits of Amsden June, Waterloo, Alexander, and any other early varieties are gathered, without delay remove the wood which has borne fruits, and spread out the young shoots that have been laid in temporarily. Doing this renders the cleansing of the trees from red-spider easier. Afford the trees a watering at the root, and rather than heavily syringe the trees, make them wet with the syringe, and dust over with flowers-of-sulphur; or mix the sulphur with the water and syringe them, leaving the sulphur deposit on the leaves for four or five days before washing it off. The trees may be kept clean afterwards by syringing them three times a week for the next two months.

APRICOTS.—Heavily-cropped trees and those growing in shallow borders will be benefited by being afforded a good root-watering. This may seem unnecessary to some, after the long spell of wet weather that we have experienced, but the Plum (the stock on which the Apricot is worked), cannot well be over-watered when growing on such warm aspects as Apricots require, and for lack of sufficient moisture at the roots, the fruit ripens prematurely, and is wanting in flavour and juiciness.

APPLES.—The Codlins and other free-bearers which had their fruits thinned a few weeks ago, may have a further thinning if the crop is still too heavy, the fruits being now of a size available for kitchen use. The fruits of early free-bearing varieties, as Frogmore Prolific, Lord Suffield, Ecklinville Seedling, Stirling Castle, Winter Hawthornden, Potts' Seedling, &c., if not heavily cropped, grow rapidly during the next few weeks, but if heavily cropped, and not afforded sufficient root-waterings, they will ripen prematurely. Trees in porous soils will need heavy root-waterings at once, and in the event of dry weather setting in, water will be necessary throughout August. Fruits of Peasgood's Nonsuch, Duchess of Oldenburgh, &c., required for exhibition, are impaired in appearance if the bloom gets rubbed off them, therefore all the leaves that cause such disfigurement should be cut off with a pair of scissors.

THE FLOWER GARDEN.

By JOHN LAMBERT, *Gardener, Powis Castle, Welshpool.*

HEDGES OF BOX.—Where hedges and specimen trees of Box form features in a garden, the keeping of them in good order requires a great amount of labour to be spent on them, if they are to preserve a good appearance. Sometimes they are trimmed twice a-year; but this is scarcely needed, except in the case of solitary specimens in flower-beds, which are almost sure to require trimming once before the bedding-out commences, and once afterwards. Box, if clipped towards the end of the present month or beginning of August, according to locality, will not grow much if at all before the spring, and thus a good deal of labour is saved. If by reason of being cut earlier a new growth takes place, this will have to be removed, or the frost will disfigure them by nipping the unripened shoots, a state of things often witnessed in the Box edgings to paths, &c., in the garden. Clipping should be done if possible in showery or dull weather, or the leaves which are mutilated will turn almost white under hot sunshine. Specimen shrubs of Box require great care in cutting, so as to preserve their proper shape, especially matched specimens. Hedges of Hornbeam, Lime, Thorn, Privet, or Elm, by way of fence or ornament to look nice, should be trimmed once in the spring and again in autumn.

CHRYSANTHEMUMS.—Plants in sunny borders should be examined frequently to see that they do not suffer from dryness at the roots, more especially those which are planted at the foot of a wall. Should the foliage appear of a light green tint, or in any other way indicate impoverishment of the soil, after first watering them with clear water, afford a good quantity of weak soot-water. The shoots of these plants should be loosely but neatly secured to stakes as often as it seems necessary, weakly shoots and those not required being removed. Examine the plants for earwigs; and should green or black-fly become troublesome, a good dusting of tobacco-powder may be afforded on a damp evening, syringing it off next day before the sun shines on them.

PLANTS UNDER GLASS.

By J. F. MCLEOD, *Gardener, Dover House, Roehampton, S.W.*

ROMAN HYACINTHS.—The earliest arrivals of these bulbs being now purchasable at the nurseries, potting may begin. As a compost for them use loam a year or more in stack, passing it through a half-inch sieve, one quarter of Mushroom-bed dung, and sharp sand sufficient in quantity to keep the soil porous. The pots may be 5½-inch ones on this occasion, placing four or six bulbs in a pot, the crowns just under the surface, pressing the soil moderately firm, and placing them out-of-doors in a sheltered place in a bed of coal-ashes, the pots being sunk 2 inches lower than the edge in the bed, and no water afforded whilst showery weather continues, but in dry warm times, water will be required.

RICHARDIAS.—Where planting out is not practised, the crowns of those plants which have been resting in pots turned on their side may receive one good watering 24 hours before shaking them out of the soil, which will have the effect of loosening the soil from the roots, and thus preserving many of the latter from injury. If the stock of plants is to be increased the crowns may be sorted into three sizes, but usually two will suffice, the largest and middle size; and in potting the first make use of 8-inch pots, and for the second 5-inch and 6-inch pots. A fibry loam of good quality broken up by hand into pieces of about the size of a hen's egg may form one half, and the other half may consist of horse-droppings, sand, lime rubbish, and charcoal. Shake the old soil entirely off the roots and pot them firmly, affording water with a fine rose watering-pot, afterwards placing them in shady quarters. When growth has commenced, free use should be made of the syringe. The variety Little Gem thrives when grown in small pots, therefore it must not be afforded large rooting space. I should recommend generally for Richardias a limited pot-room, and the resort to manure-water when feeding becomes necessary. Richardia Little Gem, grows best in mild warmth, and should be kept apart therefore from R. æthiopica.

GENERAL HINTS ON WORK.—The spring-sown tuberous-rooted Begonias should be freely flowering, and the present is a good time to select those which seem desirable flowers, and which possess vigour and the most good points. It is best not to be over-sanguine, and look for the highest excellence in the shape, substance, colour, and habit generally, these being met with in but few cases. Seed may be collected from the finest flowers, and if the crossing has been well managed the progeny will be of a desirable kind, but if the crossing is done without intelligence or any predetermined object, deterioration rather than improvement will follow. For greenhouse decoration, a collection may be got together by weeding out the worst forms obtained from seeds saved either at home, or bought from the nurserymen. The rest may be good enough for planting in the flower-beds. The cool weather permits of much work being done in the warm-houses, and gives a good opportunity to clean the permanent plants, climbers, &c., which cannot be removed to the potting-shed for this purpose. The cleansing can be effected with such simple means as soft-soap dissolved in rain-water, and a sponge or soft brush. Sometimes the syringe only will be required—a much safer procedure than the use of strong and sometimes harmful insecticides.

THE KITCHEN GARDEN.

By ARTHUR COOMBES, *Gardener, Himley Hall, Dudley.*

ENDIVE.—Seeds of the green-curled and broad-leaved Batavia varieties may be sown in very shallow drills one foot apart, where the bulk of the plants will remain to mature, whilst the thinnings may be transplanted, and form a successional crop. Where so much space as this method requires cannot be spared, it is better to sow the seed in drills at 6 inches apart, and transplant the larger seedlings first, and the remainder 10 days later. Those now large enough to transplant should have somewhat light, rich soil—they grow well between other crops, such as late Savoys, &c.

HORN CARROTS.—A cold frame may be prepared for a sowing of these varieties for winter use. The soil used should be light, sandy, and mixed with wood-ashes, or the seeds may be sown upon a border, to be afterwards covered with a frame when the nights become cold. Sow thinly in shallow drills 5 or 6 inches apart, and do not put on the lights for two months.

ASHLEAF AND OTHER EARLY POTATOS will in most gardens be ready for lifting, except those planted, which may be growing on a north border. Those intended for seed should be laid thinly in a cool place for a few weeks—a preferable method to that of leaving them out-of-doors. In wet weather the men can place the sets in an upright position ready for sprouting.

KIDNEY BEANS.—A sowing of an early variety may be made on a warm border, and in such a manner that the rows or beds may be protected by frames, &c., when the weather becomes cold or very wet. French Beans in bearing should have all pods gathered as soon as large enough for consumption, thus allowing succeeding ones to develop. Afford those in bearing manure-water, unless the plants show by their vigour that it is not wanted.

CABBAGE, KALE, BROCCOLI, ETC.—Continue to plant out from late sowings on ground that, if well manured for the previous crop, will need no fresh dressing, but merely levelling, treading well, and drawing deep drills in which to dibble the plants. These late plantings stand the rigours of winter better than earlier ones, which are apt to develop, in rich kitchen-garden soil, too much leafage.

TURNIPS.—A large breadth may now be sown, affording the land a slight dressing of superphosphate of lime if it have carried Potatos or Cauliflowers, forking in the manure. Suitable varieties are Veitch's Red Globe and Snowball, and if yellow Turnips are liked, All the Year Round. Sow seed thinly if the seed be good, protect from birds, and thin the plants before crowding spoils them.

EDITORIAL NOTICES.

Advertisements should be sent to the PUBLISHER.

Letters for Publication. — *All communications intended for publication, as well as specimens and plants for naming, should be addressed to the* **Editor, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.*

Plants, Fruits, &c., to be Named.—*Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be good ones, carefully packed and numbered, and not more than six should be sent at one time. Leaves only, or Florists' varieties cannot, as a rule, be named.*

Local News.—*Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

Newspapers.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.*

FRIDAY, AUG. 3—Orchids, from Messrs. F. Sander & Co. and others, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—63°.2.

Horticulture in Belgium.

M. EDWARD PYNAERT, in a report to the Chambre Syndicale des Horticulteurs Belges, gives a rather gloomy picture of the condition of horticulture in that country. The Ghent Quinquennial Exhibition of 1893 was of unrivalled extent and magnificence, but, owing to the political troubles of the time, and the feeling of public insecurity that existed, the results were very disappointing from a commercial point of view. In addition to that, the customs duties levied upon horticultural products coming from Belgium in almost all the countries of Europe and America have seriously injured Belgian enterprise. Phylloxera laws, the stupidity of which does not even now, in spite of their evident futility, convince the law-givers, also are a source of inconvenience and loss. Over-production is perhaps the most effective cause of embarrassment to the horticultural industry, but also the one most easily remedied. According to some figures cited by M. PYNAERT, Belgium exports annually living plants and flowers to the value, on the average, of 3,200,000 francs. France takes value to the extent of 1,067,725 francs; England, 796,993; Germany, 658,377; Holland, 321,500; the United States, 94,760; Switzerland, 50,000; Portugal, 21,050; Spain, 17,020. While exportations to France and Holland are increasing, there is a considerable falling-off in the exports to England. In 1880 we are told the exports to England amounted to 3,675,000 francs; in 1890 they had fallen to 942,000; in 1891, to 797,000; and in 1892 to 613,710 francs.

It is not protection in this last case which operates in shutting out Belgian produce, but rather that our people are finding out that they can supply their own requirements at home, instead of sending abroad, which is satisfactory to one party, if not to the other. Moreover, the number of growers on this side of the Channel has greatly increased of late years in proportion as the agricultural industry has become depressed. M. PYNAERT looks to the American market to supply in part the deficiencies in the trade with Britain. In any case, we have little doubt that the industry and enterprise of our Belgian neighbours are quite adequate to combat any temporary depression, and to suggest other means of enhancing the national prosperity where one department shows signs of falling off.

Failures in Cucumber Culture.

THE consumption of the Cucumber has, in this country, increased so much in recent years, and so large is the amount of capital which is employed in the cultivation of the plant, that an investigation into the causes which involve the loss of the plants or the deterioration of the crop, is invested with a great deal of interest for many of our readers, and is of supreme importance to some of them. It is with satisfaction, therefore, that we publish the following letter from the pen of our old correspondent, Mr. J. J. WILLIS, of Harpenden. It will add to our stock of knowledge of obscure plant diseases, and afford to cultivators the means of successfully combating a widespread malady affecting the Cucumber plant. Private gardeners who are in the enviable position of being able to obtain fresh soil at small or no cost, other than that of digging and carting it, may not be so greatly interested in the discovery of a remedy for the disease, but it must be otherwise with amateurs and residents near large towns who may have to use for several years together soils divested of the modicum of iron so very necessary for healthy growth, and who scarcely ever have access to "turf from rich old pasture land" which most calendarial writers recommend for Cucumbers, Melons, Pines, and Vines:—

"In the *Gardeners' Chronicle* for Dec. 23, 1893, p. 772, I called attention to the failure of Cucumbers when grown extensively for market, and cultivated in the same house year after year, one crop of Cucumbers succeeding another without crops of other plants intervening. Also, that after the third year paying crops of Cucumbers could not be obtained. Discussion was invited upon the question.

I take this opportunity of thanking those gentlemen who were kind enough to give their experience, but the subject was not taken up as I expected; perhaps this result could scarcely be wondered at, because in these days of such keen competition, growers for market cannot afford to reveal all their trade secrets. However, I have been enabled by the kindness of some growers who cultivate Cucumbers extensively for sale, to make certain investigations, which I venture to bring under notice, in the hope that the remarks may be of some value, and lead others to follow up the subject more fully.

It seems to be the usual practice after the growth of a Cucumber crop to remove all the surface-soil, taking it out to a depth of from 12 to 15 inches, and to convey into the Cucumber-house entirely fresh soil. Hence, whatever may be the cause of failure, it cannot be attributed to the surface soil.

Plants set in the newly-imported soil have been known to make good healthy growth up to a certain point, and then to show signs of decay, and finally yield but a meagre crop of fruit. It appears to me, therefore, that we must look for the primary cause of failure to the subsoil, and it is to that, that I have directed my attention.

The Cucumber is a plant that makes an enormous amount of growth in a very short period of time, and being of such a succulent character, it is accordingly extremely susceptible to disease.

It will readily be understood that, as the plant makes such an extensive above-ground growth, it is absolutely essential that it should make an equally extensive underground root-growth also.

From observations made of the subsoil in which Cucumbers had been grown, I have found that the roots penetrate to a considerable depth, and fill the subsoil with a mass of fibrous root-matter. A soil, therefore, in which several successive crops of Cucumbers have been grown naturally becomes charged with much decaying vegetable matter, and the supposition is, that the primary cause of failure may be due to excreted substances given off by the roots during growth, which accumulates in the subsoil. Another source of failure must be looked for in exhaustion of some kind of plant-food within the range of the roots, and this exhaustion seems likely to be of potash and nitric acid.

Now, it cannot be expected that the subsoil as well as the surface soil of a Cucumber-house can be renewed after each crop; this would involve an expense greater than the crop would bear. The only course, therefore, is to try and purify the subsoil of any injurious matters that may be present, and to supply those ingredients that have become deficient in the subsoil.

It can readily be understood that with such quickly-growing plants as Cucumbers every necessary constituent must not only be present in the soil in sufficient quantity, but these constituents must be in a readily available form for the plant to take up.

It is well known that Cucumbers are subject to fungoid diseases. In a paper read by Dr. A. B. Griffith before the Royal Society of Edinburgh on June 18, 1888, it was shown from a microscopical study that the nodular outgrowths upon the roots of the Cucumber were due to a fungus whose spores are to be found in the soil at the end of the season, where they remain dormant until the spring. The spores are also found in the atmosphere and in waters.

This fungus belongs to the Ustilagineæ, or the same group of which the smuts are important members. The author called this particular Cucumber root-fungus Ustilago cucumis. From experiments made it was found that the spores and hyphæ of this parasite could be destroyed by sulphate of iron. Mr. E. F. CROCKER, a market gardener of Ham Green, Bristol, has been successful in destroying the said fungus by using iron sulphate. He states that, having applied sulphate of iron to a crop of Cucumbers which showed signs of decay, every trace of disease passed off, and he was able to cut scores of fruits of the most splendid quality, and that the plants were extraordinarily fruitful. Mr. CROCKER further says it is the first house of Cucumbers that he has grown without disease for at least ten years.

All soils contain iron as a constituent, but this element is not always in a form to be readily taken up by growing plants. This being so, a crop must suffer, iron being one of the ingredients requisite for the formation of green chlorophyll.

Chlorophyll is a substance of primary importance in every plant, and where there is plenty of chlorophyll in a crop, it shows that there is nitrogen assimilation; and nitrogen assimilation, provided there is a plentiful supply of minerals in the soil, means healthy and vigorous plant-growth.

Some years ago, experiments were made at Rothamsted on the effects of sulphate of iron upon various plants, and it was found that while the crops did not yield any appreciable extra growth, yet they assumed a very dark-green colour, showing that chlorophyll had been formed. It was also found that the iron sulphate when applied to grass-land had an injurious effect upon mosses and all the lower vegetable organisms.

In some investigations recently made with the Cucumber, it has been found that sulphate of iron supplied in small quantities and dug into the subsoil before placing the upper layer of soil upon it, and then watering the surface-soil with a weak solution of the same, so as to allow the iron to reach the roots directly, acts as an antiseptic agent, destroying the vegetable parasitic diseases which otherwise would attack the growing crop, and further tends to

Fig. 16.—VIEW OF DRIPPING POOL, PALMERSTON PARK, DUBLIN. (SEE P. 100.)

convert the excreted matters of previous root-growth into useful and assimilable plant-food for future crops.

Young Cucumber plants while still in pots, and previously to being set out, may be beneficially watered with a weak solution of the iron sulphate. Plants so treated have maintained a healthy growth throughout their life, while others grown under similar conditions but without the iron, have been diseased and unprofitable. The subject of the food requirements of the Cucumber, based on the chemical analysis of the plant must be left for a future letter."

View in Palmerston Park, Dublin.—Our illustration on p. 99, gives a good idea of an attractive part of this public park, viz., the pool and waterfall. The progress made in the work of remaking Palmerston Park, has been rapid, and little now remains unfinished. The laying out of the grounds has been carried through in an artistic manner by Mr. William Sheppard, assisted by his son, under whose superintendence all the most important improvements of this kind for some years past have been executed in Ireland, notably St. Stephen's Green Park, and, very recently, Harold's Cross Park. In the part of the park near the Palmerston Road a flower garden has been made, around which seats will be placed, and close to this is a dripping pool, well shown in the illustration. It is supplied with a good stream of water, and has been formed in such a manner, that it is impossible to see the end of the pool from any given point. In and about the rocks are planted climbing Roses, Honeysuckle, Ferns, Yuccas, numbers of herbaceous perennials, and Austrian Pines which will in a short time be very effective. From this pool, walks are made, encircling the park leading to the western end. Near to this are some very fine old Pine trees, Cedars and Elms, which give that part a furnished appearance. Much tree planting has been done, especially on the boundaries, where the Austrian Pine has been used in beltings in considerable numbers.

Botany at Harvard.—A friend of Harvard University, whose name is withheld, recently gave 10 000 dols. to its Botanical Department for immediate expenditure. One-quarter of the sum will be used for the Gray Herbarium, while one-quarter will be devoted to the Botanic Garden, and the remaining half to the Botanical Museum for the completion of some of its collections. *Garden and Forest.*

Bristol Amateur Horticultural Society.—At the invitation of the President, Councillor J. Walls, M.R.H.S., the members of this Society and friends assembled in the gardens at Cromwell House, Royal Fort, St. Michael's, on Wednesday evening, July 16th, to hear a lecture on Orchids given by Mr. Wm. Tanser, gardener to R. B. Cater, Esq., of Bath. The lecturer discoursed on the different species and their habits, and gave some valuable advice as to their treatment at various seasons. The lecture was illustrated by specimens grown in the gardens. A hearty vote of thanks was passed to the lecturer on its conclusion. Tea and coffee were provided by Mrs. Walls, and a hearty vote of thanks was accorded to that lady and her husband.

The Effect of the Railway Strike in the United States.—The railroad strike, which has practically put a stop to freight traffic between the Atlantic and the Pacific coasts, has brought about some strange conditions in the fruit market here. Two car-loads of California fruit, belonging to the Earl Fruit Company, by some good fortune reached this city on Monday in fair condition, and since it is not probable that any more California fruit will arrive for a month, the prices brought were unusually high. Plums sold for as much as 3 30 dols. a box and upward; Apricots, which a few days ago sold for 70 and 80 cents a box, went up to 3·05 dols.; Peaches brought 3 30 dols. a basket; Bartlett Pears brought 4·75 dols. a box, while Seckel Pears brought 5 dols., and a few red Astrachan Apples sold at the rate of 17 dols. a barrel. Naturally, the stoppage of so large a source of supply as the California orchards has strengthened the prices of all local fruits like Cherries, Raspberries, and Water Melons, as well as the few Oranges and Pine-apples which are now coming into this part. Bananas, too, are considerably higher, while Lemons, on account of the falling off of the demand in the West, are piling up here, and becoming a drug in the market. The fruit-growers of California, especially those who depend on early fruits, must sustain very heavy losses. In such places as Vacaville, telegraphic advices say that tons of early fruit are being dried or canned, as no fruit trains have started from that point for more than a week. Arrangements are not adequate, however, for drying all the fruit produced, and many of the canneries can get no sugar, so that much of it has already been wasted. At this time, in an ordinary season, 250 car-loads of fruit leave San José alone for the East every day, and it is impossible to can or dry this enormous quantity, so that if the blockade continues long, enormous quantities of fruit will be sacrificed. *Garden and Forest.*

"Nettle-Headed" Hop.—We have received the following letter relating to the effects of eel-worms in the root of Hops:—Last week when visiting the Hop-gardens of Mr. E. A. White, Beltring, Paddock-wood, Kent, I had the opportunity of examining specimens of "nettle-headed" Hops, a disease which is apparently on the increase in the Hop-growing districts of this county. The general appearance of the plants led me to suspect some root disease. Since then Mr. White has been good enough to send me complete and typical specimens of the disease, and on careful examination I find that the spongy cortex of the root is extensively injured, the injury always being accompanied by large numbers of Nematodes, which are evidently the direct cause of the mischief. The further investigation of the matter I intend to carry out without delay. *John Percival, Botanical Laboratory, Natural History Museum, South Kensington.*

Tadcaster Paxton Society.—The members of the above society and their friends made their first annual excursion on Wednesday, 18th inst., visiting the Marquis of Ripon's demesne of Studley Royal and Fountains Abbey. The party was met and conducted round the gardens by Mr. Knellor, the Marquis's gardener, who has greatly improved the place of late years. On the return journey, some of the party visited the charming gardens of E. Becket-Fabre, Esq., at Harrogate.

M. Alphand.—Under the auspices of the National Horticultural Society of France, 84, Rue de Grenelle, Paris, a movement is on foot for the purpose of erecting a statue to M. Alphand, who did so much to create and embellish modern Paris.

Jardin des Plantes.—We have received from the Muséum d'Histoire Naturelle de Paris a list of living plants which are offered by way of exchange to other Botanic Gardens and likewise to special correspondents.

Birmingham and Midland Counties Gardeners' Association.—The Birmingham and Midland Counties Gardeners' Mutual Improvement Association, on the occasion of their annual excursion recently, payed a visit to Llandudno and Bodnant Hall, and the party numbering 103 persons found much to admire and interest them in the fine mountainous scenery and the well planted and admirably kept gardens rich in shrubs and Conifers.

Strawberries.—So great has been the failure this year, that we have heard of large growers ploughing the plants in. It seems as if the crowns were burnt up by the heat and drought of last autumn, whilst the spring growth was checked by the frosts of May. What fruits there have been, have been watery and devoid of flavour.

Brixton, Streatham, and Clapham Horticultural Society.—In the death of Miss Roupell, of Harvey Lodge, Streatham Hill, this Society loses a friend who for many years took an interest in its welfare, and visited its annual shows with delight. Many of the committee and other working members of the Society were personally known to her, and these felt so much regret at her death that they subscribed amongst themselves for a beautiful wreath, artistically arranged by Messrs. Perd & Sons, of Roupell Park Nurseries, and forwarded it on the 18th inst., the morning of the funeral, as a mark of respect and esteem.

Erinosis in Vines.—Every now and then we meet with Vines with patches of light brown felt on the leaves. This felt consists of matted hairs, and was at one time thought to be connected with the presence of a fungus. The real culprit, however, is a mite, Phytoptus vitis. The irritation set up by this creature causes the preternatural development of hairs. Sometimes this occurs also on the young flowers of the Vine, and in a specimen lately sent to us every flower in the bunch was thus affected—a most serious matter. Affected leaves or bunches should immediately be burned. Whether spraying would be of any benefit we doubt.

Pears seem to be the crop of the year so far as fruits are concerned. From various quarters we hear of abundant crops, but this will be more fully set forth in the fruit crop returns to be published in our issue for August 4.

Royal Scottish Arboricultural Society.—The annual meeting will be held at 20, George Street, Edinburgh, on Monday, August 6. The annual excursion will extend from the 7th to the 10th of August, and will be devoted to a visit to several famous estates in Strathspey, Moray, and Banff.

Stealing Shrubs.—On the 16th inst., at the Edgware Petty Sessions, a sentence of 21 days' imprisonment was passed on a prisoner convicted of stealing shrubs from the nursery of Mr. J. J. Foster, at Stanmore, Middlesex. The plants taken were valuable, being 54 good plants of Cupressus Lawsoniana erecta viridis, about 2 feet high. The man principally concerned in the theft has so far managed to escape arrest.

Monographie des Roses.—Rosarians who care for the botanical history of the genus Rosa, will hail with unwonted delight the prospect of a work on this subject from the pen of M. Crépin. The eminent Belgian botanist has devoted more than thirty years' study to the subject, and it will be a great convenience to have his numerous scattered papers condensed into the form of a monograph. Subscriptions (10*s.*) should be sent to Messieurs Mayolez & Audiarte, Rue de l'Impératrice, 17, Brussels.

Publications Received.—*A Catalogue of the Flowering Plants and Ferns found in the Island of Penang*, by Charles Curtis.—*Annual Report of the Royal Botanic Garden, Calcutta.*—*Bulletins of the Botanical Department, Jamaica*, and of the *Botanical Stations, Antigua*, and *St. Kitts.*

Home Correspondence.

VERONICA TRAVERSII.—I was glad to see mention made, in your recent issue, of Veronica Traversi, and the only wonder to my mind is that it is not more often seen in gardens. There is a very fine plant of it in the grounds of the Atkinson Morley Hospital at Wimbledon, which I had planted there six years ago. The bush is now 10 feet 8 inches across, and 6 feet 4 inches in height. It has been one mass of bloom this season, and the flowering buds are exquisitely beautiful. I am very fond of my pet floral child. *John Colebrook.*

CANTERBURY BELLS.—Varied and beautiful as are the Campanulas generally, none equal in decorative effect, size of bell, and variation in form and colour, the Canterbury Bell. True, the flowers are bells, now literally Great Toms, and yet more properly huge cups, for they stand erect rather than hang. The Canterbury Bell of to-day is a very different flower from that of some twenty years since, or may it be said, of the old strain. Those gave flowers of perhaps two or three colours, of smallish size, single, and the plants were not of marked robustness. Now we can find in a good strain singles, semi-doubles, and doubles, the variations being found in the number of cups. Nature—for it seems, after all, to be chiefly of her doing—has crowded one into another. When there are twin cups, usually the finest form and largest cups are seen; when, however, three or four are in one, then the flowers are very solid and double, reproductive, but still rather shy; these also are of the latest to bloom. Colours include white, grey, lavender, blue, deep blue, rose, cerise, heliotrope, and other tints, all singularly beautiful. When seed is sown early in the spring, and plants send up several stout flower-stems the following year, single plants in bloom form perfect bushes of flower, and cannot well be excelled by any other hardy biennial. The remarkable development found in Canterbury Bells puts these flowers into the florist's category; for if Nature has done much, so also has the patience and care of the seed-grower been greatly exercised to produce all this wealth of beauty. I saw but the other day a huge mass of these plants in bloom; it was at the Bedfont seed-grounds, and the sight was worth going a long way to see. Besides the normal plants with their rough calyx, there were many of the fine and curious duplex or Calycanthema type, and as varied in colour. The conversion of the green sheath into a broad, saucer-like flower, is one of those strange floral developments that lead us sometimes to believe that flowers have transforming powers far beyond anything that has hitherto been seen. *A. D.*

THE COMMON LIME TREE.—It has been my good fortune of late to see some specimens of Lime trees, and samples of fine avenues of Limes in full foliage, flower, and early fruitage; among others, the magnificent Lime avenue of Torquay, in Devonshire. Not having seen the famous Linden or Lime avenues of Berks, I confess that this Torquay avenue is the longest and the tallest I have seen. But the profusion of bloom, and the prodigality of embryo seeds and scales on some Limes, add greatly to their interest and beauty; while their stately habit, early and ample foliage, admirably fit them for forming avenues or groups, whilst they are also very effective as single trees. Their fragrance, however, is perhaps their most valuable quality. [In Germany an excellent table oil is expressed from the seeds, of good bright colour, and pleasant flavour. Ed.] With the single exception of the Grape-vine in flower, we have no plant or tree to exceed the Lime in the over-flowering abundance, and sweetness of its odours. It may be fancy, but I think it fact, that the Lime and Vine in bloom smell more alike than any other two plants that can be compared. All will admit that either is sweet enough to satisfy the most rapacious consumers of odours rich and sweet. Some, indeed, think both plants as too fulsome for their olfactory nerves. But, on the other hand, others welcome both, as well as the veritable dose of prussic acid distributed by Portugal and common Laurels in bloom, as antiseptics or deodorisers of rare potency and value. Several times within the last week I have felt grateful to Limes in bloom for overlying bad smells with such a thick surface-coating of sweetness as to render the former imperceptible, if not innocuous. Largely for this reason, as well as for the intrinsic beauty and copious shade of the Lime, I have for years advocated its being planted more or less largely wherever it will thrive as a town tree. The chief objection urged against it has been, that it sheds its leaves early in the autumn. This I consider a merit for town trees. Their verdure, shade, and sweetness are most needed in the early spring, summer, and autumn. Though the leaves begin to fall so soon, the sooner they are wholly swept off the better, and the dilapidated verdure gives place to bare boughs, beautifully crystalled over with hoar frost. *D. T. F.*

TOMATO-GROWING AT GODALMING.—The other day I looked in at Mr. Mitchell's nurseries at Godalming, and to my surprise he has erected two houses, spanroof, each of which is 115 feet long, and he contemplates erecting some more for the purpose of growing Tomatos for the market. Formerly he used to grow for the local trade, but now that the demand for the fruit has so much increased, he is endeavouring to meet it. A seedling Tomato, which he has raised between Challenger and Trophy, has the free-setting properties of the former, and the heaviness of the latter. It produces large clusters of, on an average, seven handsome large fruits, smooth, regular in form, and of a glowing scarlet colour; the flesh of fine quality, firm and solid. Mr. Mitchell had gathered more than 1000 lb. from his 400 plants, and reckoned his crop for the season at two tons. I do not advocate the giving of names to any chance variety that a man may raise, unless it is very superior to others; but from what I saw at Mr. Mitchell's, and the information I was able to glean about this one, I should say that it will be much sought after. And I am not alone in thinking so, as one of the largest growers for market is desirous of purchasing it for his sole trade; and although he grows some eighteen to twenty tons of Tomatos yearly, nothing like it has previously come under his notice. The supply of Tomatos is not equal to the demand, although foreign-grown fruit comes here in great quantities, and, when the price per lb. becomes low, as is the case late in the summer, there is a very general demand for home-grown produce. If more Tomatos were grown near small towns to supply local requirements, the growers would receive more for their produce, and the consumer pay less than is now the case when the bulk of the crop is sent to London, and has to bear the cost of railway freight to and fro, commission charges, &c. *A. Evans, Lythe Hill, Hazlemere.*

FLOWERING OF AGAVE AMERICANA.—In the *Gardeners' Chronicle* for June 23, p. 786, the flowering of the two American Aloes at the Royal Botanic, Regent's Park, is noted, and I would remark that we have a fine plant of the same species about seventy years old which is throwing up a large flower-spike. *W. Archer, Hill House, Saffron Walden.*

PHORMIUM TENAX.—At p. 45, Mr. Divers says that "the failure of the above-named plant from frost in Cornwall may be due to imperfect drainage." There are many hundreds of the New Zealand Flax growing here, and most of them are on the edges of ponds, where the roots run out several feet into the water, and those which were the nearest to it were the least harmed from frost, at the same time that the plants in Cornwall were killed. Phormium Veitchii, P. Colensoii, P. atropurpureum, and P. tenax variegatum, are the varieties grown here outside, and the last-named was the least harmed, and is now in flower. Fortunately, during the very severe frost, which lasted only three days, the ground was covered with snow, which saved the crowns and all leaves bent to the ground by its weight; all leaves exposed were killed, and great quantities were carted away and burned, the fibre being too tough for it to rot when put with other vegetable matter. Mr. Divers is rather surprised that the Flax should be killed in Cornwall, and yet pass the winter so much further north uninjured. I think this shows the diversities of our climate. Here, on January 6, we had 26° of frost at 6 A.M.; at 9 A.M., 22°; at noon, 14°; this very severe frost did much damage to tender vegetation through the whole south-west of the British Isles; so severe a frost cannot be remembered by the oldest person. *W. O., Fota, Queenstown, Cork.*

CEANOTHUS NOT HARDY.—It is pretty well known to gardeners that the Ceanothus is not, as regards most of the varieties, hardy in all parts of these islands. A plant of C. divaricatus, growing against a south wall at this place, and 30 feet high, a little exposed to the north wind at the end of the wall, succumbed to frost this year. It was first injured by the frost of 19° on January 19, 1891 and the 24° of frost experienced on January 5 last quite killed it. It was planted thirteen years ago, and had grown very fast, the stem being 9 inches in diameter at the base. It flowered profusely every year. Gloire de Versailles, another variety, was killed the second winter after planting, on a full south aspect, and protected from the north wind. C. dealbata appears to be the hardiest variety in my part of Hants. *E. Molyneux.*

SWEET PEAS.—Never in my experience have I seen Sweet Peas do so well as this season. Of the fifty or more varieties sown, none failed. Some are much more robust than others, under the same kind of treatment. The earliest to bloom were some that were self-sown, and which came up after rain in October; and these, owing to the mildness of the autumn, were very forward by Christmas time, being fully 6 inches high. These plants suffered somewhat from the severity of the weather in January, but as the plants stood singly they were hardy, and in March they began to grow away rapidly, and began to bloom towards the end of May. Seeing how these self-sown seeds were inclined to branch when they started into growth, I was induced to sow the others more thinly than usual, and am only sorry that the seeds were not put at least 6 inches apart, as they would then have done far better, for Sweet Peas, like the culinary varieties, are very robust this season, growing from 7 to 8 feet high. Of a row consisting of the varieties Captain of the Blues, Countess of Radnor, Mrs. Sankey, Splendour, Her Majesty, and Mrs. Gladstone, the first-named is 8 feet high. These varieties were sown in pots on February 1, five seeds in a pot, and placed in a vinery till they germinated. After being hardened off, they were planted out in the first week in March, each potful of plants being placed 1¼ feet from its neighbour; and so well did they grow, that in a short time the row presented the appearance of having been sown and planted thickly, as from ten to a dozen shoots started from each plant. At the present time they are a charming feature, being clothed with bloom for the greater part of their height, and the flower-stalks are from 1 to 1¼ feet long, the flowers of good substance and fine colour. Another row consists of the varieties Princess May, Stanley, Emily Henderson, Dorothy Tennant, Lady Penzance, and others of beautiful shades of colour. The American variety has done very well; and no doubt other gardeners, like myself, were induced to work up a stock of it from cuttings as soon as the plants were large enough. The plant is a free bloomer, the flowers large and of good substance, and pure white; there are others, however, quite as good, which throw stronger stems. Another row consists of the latest novelties, viz., Duke of York, Novelty, Venus, Mrs. J. Chamberlain, Meteor, and Duchess of York, some of which are very beautiful in their delicate tints and showy flowers. Those who have hitherto been content to grow none but the old varieties, would do well to procure the new ones, and grow them well. It used to be the custom to sow rows of Sweet Peas thickly, in the

hope of obtaining a large quantity of flowers, but the soil soon being exhausted, the blossoms were but few, and of poor substance. To grow Sweet Peas well, the ground can scarcely be too rich, and the plants must be allowed plenty of space; and if seeds be sown in pots, only three plants should be left in each, as I find that five plants become too crowded even when the potsful are planted out at 1½ feet apart. Sticking the plants in time is of importance, and the sticks should be strong ones, well furnished with sprays, and placed at least 2½ feet apart at the top, so as to allow the haulm plenty of space in which to grow. If three sowings are made at intervals of about one month, the first being early in February, to be planted out in March; another about the last week in March, to be planted out in April; and a third in the open ground in May, will furnish blooms till frosts come. *H. C. Prinsep, Buxted Park.*

OSMANTHUS ILICIFOLIUS IN FRUIT.—Last year some of the rarer and scarcer shrubs flowered here, and set fruit for the first time, so far as I know, among them the Osmanthus, fruit of which I am now pleased to be able to forward to you for your inspection. I believe it is still very uncommon to see it in fruit; and at all events, it is the first time it has fruited at Powerscourt. The silver variegated form also flowered here last year, but it set no fruit. There is a sprig of fruit on the bush from which I picked the fruit I have sent, but I noticed it is all on the south-west side of the bush. I also observe that a number of Conifers are producing cones here this season that have not done so before, such as Cedrus atlantica, C. Deodara, Abies magnifica, and others. I have not seen the fruit of Osmanthus before grown in this country; but it is probable that it may have fruited in the south, although I am not aware of it. The plants of it flowering and fruiting at Powerscourt were planted by me in 1867—small plants about a foot high—so that they are now about thirty years old. *C., The Gardens, Powerscourt.* [It is, so far as we remember, the first time we have seen the fruit. Ed.]

SOCIETIES.

ROYAL HORTICULTURAL.

July 24.—In connection with the meeting on Tuesday at the Drill Hall, James Street, Westminster, was held the annual exhibition of the Carnation and Picotee Society, which attracted a good number of exhibitors. The exhibits under the ordinary committees were also more than usually numerous, and a large quantity of certificates and awards were granted to new and rare plants. Begonias and Caladiums were especially well shown, and some capital lots of Gooseberries were shown by nurserymen.

Floral Committee.

Present: W. Marshall, Esq., in the chair; and Messrs. J. Fraser, J. Laing, O. Thomas, H. Herbst, H. B. May, C. T. Druery, R. Owen, G. Stevens, C. F. Bause, W. C. Leach, H. Cannell, J. D. Pawle, J. Walker, G. Gordon, H. J. Jones, E. Molyneux, G. Paul, and C. E. Shea.

A very nice group of Gymnogrammas and Selaginellas came from Mr. H. B. May, Dyson's Lane Nursery, Upper Edmonton. Selaginella Lyallii and S. Emiliana are two vigorous and pretty plants. A First-class Certificate was awarded to the latter. Gymnogramma decomposita, G. schizophylla and its varieties grandiceps, gloriosa, &c., were well shown. Also the curiously-crested G. Parsonii, some plants of Carnations, Winter Cheer, Miss Joliffe Improved, &c., were likewise included (Silver Flora Medal).

Mr. H. J. Jones, Ryecroft Nursery, Lewisham, S.E., had a huge bank of tuberous-rooted Begonias in flower, mostly single varieties. The numerous bright blossoms were freely interspersed with Cocos, Ferns, Asparagus prostratus, &c., and the group was one of the gayest features of the meeting (Silver-gilt Flora Medal).

From Messrs. Wm. Cutbush & Son, Highgate, London, N., came a group of hardy flowers in considerable variety; some bunches of Coreopsis grandiflora were exceeding bright, also a collection of cut blooms of Carnations (Silver Banksian Medal).

Another group, rich in good hardy flowers, was from Mr. B. Ladhams, Shirley Nurseries, near Southampton. The curious Michauxia campanuloides was included; Eryngium amethystinum, and Eryngium alpinum, were good; also a bunch of the Monarda didyma, less common in herbaceous borders than it ought to be; Bocconia cordata, Acanthus mollis, Centaureas, Spiræas, and Echinops, were amongst the other good things, and the pretty blue Scabiosa caucasica, was well represented (Silver Flora Medal).

Messrs. Jno. Laing & Sons, Forest Hill, S.E., set up a large and handsome group of Caladiums in numerous varieties:—Triomphe de Conte, a fine leaf of dark rose having on most of the leaves green veining; Itapocii, a large, thick, dull, crimson-coloured leaf with markings of dark green; and Paquer, a large leaf of pleasing shape with intensely red veins and much of the leaf white, other parts green, were all granted Awards of Merit. Amongst a number of other fine varieties, Rio de Vermellio, a large handsome leaf, of peculiar and even markings, might well have received an Award. Ignatii is quite a novelty; the leaf is bright rose, with very striking veining of dark green. The same firm received Awards of Merit for Sonerila Souvenir de Madame van Houtte and S. François Marchand, the leaves having a very dark green ground and minute white spots (Silver Flora Medal).

Messrs. J. Veitch & Sons, Chelsea, showed plants of six good varieties of Caladiums, each kind grouped together in a pan. Awards of Merit were given to Duke of York and Duchess of York, both dwarf-growing, self-coloured varieties, the latter variety being of much lighter shade than the former. Also to F. W. Moore, another self-coloured variety, with leaves a little larger than the others; and to Chelsea Gem.

The same firm received a First-class Certificate for Selaginella vividangula, a very handsome tasseled variety; and an Award of Merit for a large double Fuchsia, called Ballet Girl, sepals deep red, corolla white.

Messrs. H. Cannell & Sons, Swanley, had a group of double Begonias: Octavie, a pretty dwarf, free-flowering double white variety; Rev. Lascelles, yellow; and Mary Cornell, rose. An Award of Merit was made to the variety Beauty of Eynsford, noticed in our columns last week, and to a fine Canna named Colibri. A number of bunches of double Ten-week Stocks from the field, illustrating a good strain, were also included (Silver Flora Medal).

Mr. B. R. Davis, Yeovil Nurseries, Somersetshire, had a large collection of Begonia blooms, embracing both double and single varieties, staged on boxes covered with moss and Ferns; capital varieties were represented in both sections (Silver Banksian Medal).

From M. Louis Van Houtte, père, Ghent, Belgium, came a capital collection of Bertolonias and Sonerilas. Awards of Merit were given to the following:—Sonerila Duchesse de Brabant, S. Madame van Langeshool, Bertolonia Margarita superba, B. Triomphe de l'Exposition de Gand, B. Comtesse de Kerchove de Denterghem (Silver Flora Medal).

Mr. W. Rumsey, Joyning's Nurseries, Waltham Cross, had a group of cut Roses in a good number of varieties. The flowers were very fine (Silver Banksian Medal).

Messrs. F. Sander & Co., St. Albans, exhibited a pan of Impatiens auricoma, a yellow-flowering species.

From the Right Hon. Lord Penzance, Godalming, came a number of hybrid Sweet Briars, and an Award of Merit was given to Diana Vernon, a perpetual-flowering hybrid, with large single rose-coloured flowers.

Hybrid Streptocarpus and some sprays of Desfontainea spinosa came from the Dowager Lady Bowman, Dorking,

Mr. A. Waterer, Knap Hill Nursery, near Woking, had sprays of his Spiræa Anthony Waterer.

Messrs. Wallace & Co., Colchester, again showed flowers of their Calochortus. First-class Certificates were given to C. Plummeræ, a very lovely variety; and to Tigridia grandiflora lilacea, a good rose-coloured one, with basal spotting. An Award of Merit was given to Gladiolus Lemoinei, J. H. Krelage; and a good number of Liliums were shown, including a very fine lot of L. longiflorum giganteum (Bronze Banksian Medal).

A group of Sweet Pea blossoms in variety was sent by W. H. Myers, Esq., Swanmore Park, Bishop's Waltham (gr., Mr. Molyneux). (Bronze Banksian Medal).

Messrs. Collins Bros., 39, Waterloo Road, S.E., received an Award of Merit for a very fine white perennial Phlox named Avalanche.

Mr. T. S. Ware, Hale Farm Nurseries, near Tottenham, staged a very pretty collection of Carnations in bunches, with plenty of "grass." There were numerous fine varieties, and they were staged in the most tasteful manner, as well as the most natural. Also plants of Carnation Pride of Great Britain.

An Award of Merit was given to Carnation Cantab, a richly-perfumed scarlet-clove, exhibited by Mr. F. Gifford, Tottenham. Similar awards were obtained by Ladas, a yellow ground Picotee, edged with red; President Carnot, another yellow ground edged heavily with deep rose; and The Burn, a very pretty blush Carnation, with pink centre; Mrs. Douglas, a pale ground flower, edged with pink; and Eudoxia, all shown by Mr. Douglas, gr. to Mrs. Whitbourne, Great Gearies, Ilford.

Plumeria alba, exhibited by Mr. Moore, from the Royal Botanic Garden, Glasnevin, received a First-class Certificate; and an Award of Merit was given to Noisette Rose Madame Pierre Cochet, from Messrs. Paul & Son, Cheshunt.

Messrs. J. Laing & Sons, Stanstead Park Nurseries, Forest Hill, showed a small number of beautiful Tuberous-rooted Begonias as plants, viz., Miss Hicks, a very double and large white bloom; B. Lady Tyler, an equally fine scarlet-flowered variety (Award of Merit); Croton Mr. Bause, a variety with large, plain leaves, marked with yellow on a green ground, and having a thin edging of rose colour. Some self-coloured Antirrhinums of dwarf, compact habit, suitable as bedders, came from this firm.

Miss Mason, 21, Queen's Mansions, Victoria Street, sent a bunch of Helleborus niger flowers, but whether they were forced, or had been artificially retarded was not stated.

A Carnation, Lady Henry Grosvenor, pink in colour, and with the true old Clove scent, came from Mr. Drawfield, gr., Bulwick Park, Wansford.

Some leaves and racemes of blooms of Pterocarya caucasica were sent by Mr. Burrell, gr. to the Duchess of Albany, Claremont. The flowers, which are very seldom produced in this country, are arranged in four parallel rows, on a stalk 1 foot in length. (See *Gardeners' Chronicle*, 1888, vol. iv., p. 781.)

Messrs. G. Bunyard & Co., Old Nurseries, Maidstone, had a collection of Spiræas, rich in pink and red-coloured flowers. We may mention Billardi, a form of Douglasi, Blumei, Douglasi, callosa, Pallasii and Bumalda, forms of callosa, Nobleana, and the very bright red Fortunei. The white species were Lindleyana and callosa alba. A hardy species of St. John's-wort (Hypericum aureum) was also shown. It has flowers, yellow, about 2 inches across.

Messrs. J. Veitch & Sons, Royal Exotic Nursery, Chelsea, showed Retinospora squarrosa sulphurea, in which the young growth is of a yellowish hue; in other respects the plant exhibited no departure from the normal (Award of Merit). A yellow-flowered Diervilla sessilifolia, and Spiræa callosa var. atrosanguinea, were shown.

From Messrs. Dobbie & Co., Rothesay, N.B., came an extensive show of Sweet Peas, in great variety of colours, showing much advance on what it was common to see in our gardens. Blues of fine quality were Dorothy Tennant, Princess of Wales, Britannia, and Princess May. Yellows: Primrose, Orange Prince, and Lady Beaconsfield. Whites: England, Delight, and Emily Henderson. Roses and pinks: Lady Penzance, Miss Blanch Terry, Gaiety, Princess Beatrice, Firefly, and Her Majesty.

Violas and Pansies, shown in various ways, were largely shown by this firm of florists. Viola Iona, a flower whose colours consisted of dark blue, arranged like a star on a ground of much lighter blue, received an Award of Merit. Their Fancy Pansies were extremely varied as to colour, and some showed very regular markings. Selfs were few in number, and their colour was chiefly purple of some tint. Auricula-eyed Sweet Williams, chiefly those with white grounds, formed part of the exhibit (Silver-gilt Flora Medal).

A small lot of plants of the Clove Carnation was shown by Mr. J. Wallborn, Cedars Nursery, West Kensington. They were of very fair quality but small, not being the first opened flowers, and showed how this variety fares in London (Silver-gilt Flora Medal).

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair, and Messrs. J. O'Brien (Sec.), R. Brooman-White, T. B. Heywood, F. Sander, Dr. Maxwell T. Masters, H. M. Pollett, H. J. Chapman, E. Hill, T. Statter, S. Courtauld, H. Williams, and H. Ballantine.

Although not an extensive show of Orchids, yet some fine species and varieties were there; two grand forms of Cattleya Hardyana were sent by the Right

Hon. Lord Rothschild, Tring Park, Tring (gr., Mr. E. Hill). Of these, the Tring Park variety was a very fine inflorescence, consisting of five flowers (a First-class Certificate and a Cultural Commendation). It is the finest form of the true type which has as yet appeared, the brilliant ruby-crimson of the lip, and the bright orange of the throat being very distinct, and the flowers of large size; the other, C. Hardyana Lavertinense, which likewise received a First-class Certificate, had sepals and petals of mottled dark rose and white, and the front of the lip purplish-crimson colouring.

Messrs. J. Veitch & Sons, Royal Exotic Nursery, Chelsea, showed for the first time Lælio-Cattleya × Zephyra (L. xanthina ♂, C. Mendeli ♀), a very pretty hybrid, with some resembance to Cattleya Rex. The sepals and petals were of pale buff-yellow colour, the petals whitish at the base, lip yellow, brightest inside the tube, front of the lip of a rich crimson colour (First-class Certificate); Sobralia × Veitchii (xantholeuca ♂, macrantha ♀), a very fine thing with large flowers, the sepals and petals white, with a faint pink blush. The tube of the lip was yellow, and its broad front lobe very pale lilac (First-class Certificate). Messrs. Veitch also showed Lælio-Cattleya × Pallas (C. Dowiana ♂, L. crispa ♀), and a fine specimen of their new Dendrobium glomeratum.

Messrs. F. Sander & Co., St. Albans, exhibited a group of rare Orchids, among which were Lycaste × Schönbrunnensis, of the form of L. Skinneri, and with brownish-rose sepals, white petals spotted red, and white and crimson lip (Award of Merit); Galeandra lagoensis, a very singular species, with greenish sepals and large rose-crimson lip (Award of Merit); Pleurothallis Kränzlinii, a singular little species with pretty purple and silver-white flowers (Botanical Certificate); and Catasetum Christyanum, a very strange and striking species (Botanical Certificate). This firm also showed the very beautiful Cattleya × Prince of Wales (Wagneri × intermedia), with large wax-like white flower, the lip delicately veined with rose; several plants of their new strain of Oncidium Jonesianum, Brassia Sanderiana, Dendrobium O'Brienianum and D. O'B. striatum, Cypripedium × modestum (Io × purpuratum), Cattleya Rex, C. Brymeriana, Odontoglossum Galeottianum, Zygopetalum Lehmanni, Cycnoches peruvianum, Catasetum macrocarpum, Aërides Sanderianum, Cryptophoranthus Dayanus, Angræcum Scottianum, &c.

Major Joicey, Sunningdale Park, Sunningdale (gr., Mr. F. J. Thorne), showed a comparatively small plant of Cattleya Warscewiczii, with a six-flowered inflorescence; and a vigorous plant of Anguloa Ruckerii, with ten flowers. A well-deserved Cultural Commendation was awarded.

Messrs. W. L. Lewis & Co., Chase Side, Southgate, were awarded a Silver Banksian Medal for an excellent group of showy Orchids, one of the most interesting of which was Habenaria carnea var. nivosa, with large flowers, as in the type, but of a pure white (Award of Merit). Their Odontoglossum citrosmum sulphureum, too, was a very fine and unique variety, with sulphur-yellow sepals and petals, and rose lip, with a yellow hue over it, and orange crest (Award of Merit). In the group were good examples of the large-flowered Cattleyas, a pan of Anæctochilus petola, Restrepia striata, Microstylis Scottii, Zygopetalum Gautierii, Bifrenaria vitellina, Oncidium macranthum, &c.

Messrs. B. S. Williams & Son, Victoria and Paradise Nurseries, Upper Holloway, N., showed Odontoglossum Schlieperianum, and the clear yellow formof it, O. S. aureum; and Oncidium crispum grandiflorum.

T. Statter, Esq., Stand Hall, Whitefield, Manchester (gr., Mr. R. Johnson), exhibited Cattleya granulosa superba, a fine variety, in which the marginal half of the front lobe of the lip is white (Award of Merit), and C. Warscewiczii regalis.

F. Wigan, Esq., Clare Lawn, East Sheen (grower, Mr. W. H. Young), showed a good plant of Cattleya (Lælia) Lindleyana, with four flowers. The Rt. Hon. Lord Llangattock, The Hendre, Monmouth, gr., Mr. T. Coomber, showed Cypripedium × The Hendre, a C. Lawrenceanum cross with flowers partaking much of that species.

S. G. Lutwyche, Esq., Beckenham, showed Stanhopea Shuttleworthii, with flowers not expanded. C. J. Lucas, Esq., Warnham Court, Horsham, sent a spike of Brassia Wrayæ. Messrs. Hugh Low & Co., staged a small group of Orchids, in which were Trichopilia Galeottiana, Paphinia rugosa, varieties of Cypripedium Charlesworthii, Oncidium Lanceanum, Cypripedium Volonteanum, C. bellatulum, Lælia amanda, &c.

R. Young, Esq., Fringilla, Sefton Park, Liverpool, sent flowers of Cattleya Eldorado, var. crocata, white, with an orange-coloured base to lip, which was cut from the plant illustrated in the *Reichenbachia*. F. W. Moore, Esq., Curator, Royal Botanic (Bollea), Lalindei, Gongora atropurpurea, Bifrenaria tyrianthina, Bulbophyllum leopardinum, and Dendrobium ciliatum (Botanical Certificate). P. Ralli, Esq., Ashstead Park, Epsom (gr., Mr. G. Hunt), showed Anguloa uniflora eburnea, with seven flowers.

Mr. H. A. Tracy, Orchid Nursery, Amyand Park Road, Twickenham, showed Cattleya Mendelii, H. A. Tracy, a very fine variety, with large and well-formed flowers; sepals and petals white; lip large, very rich crimson in front, and golden-yellow at base (Award of Merit).

A. J. Hollington, Esq., Forty Hill, Enfield (gr., Mr. Ayling), exhibited Cypripedium × Hobsoni and C. × Millmani, obtained by crossing C. Philippinense and C. callosum; the flowers were pretty, and resembled light-coloured C. × selligerum.

Fruit Committee.

Present: Philip Crowley, Esq., in the chair; and Messrs. J. Cheal, T. Jones, J. Wright, A. Dean, J. Willard, C. Herrin, G. Wythes, H. Baldeson, J. Smith, F. Q. Lane, W. Wilks, G. Bunyard, and G. H. Sage.

A wonderfully fine collection of Gooseberries was shown by Messrs. J. Veitch & Co., Chelsea, consisting of about 136 varieties.

Gooseberries are unusually large this season, and the collection was the centre of much interest and admiration. To illustrate the capital crop borne by the bushes, a few dozen sprays, thickly clothed with fine fruits, were included in the exhibit, and amongst the numerous varieties particularly good, were the following. Red: Clayton, Conquering Hero, Dan's Mistake, Eskender Bey, Forester, Lord Derby, Whinham's Industry, Speedwell, Warrington, London, and Slaughterman. Green: Stockwell, Telegraph, Fearless, Green London, Surprise, and Matchless. White: Queen of Trumps, King of Trumps, Mitre, Freedom, Antagonist, Coppice Lass, Careless, and Hero of the Nile. Yellow: Trumpeter, Catherina, Criterion, Drill, Leader, Mount Pleasant, Hue and Cry, Leveller, Railway, Drill. Of special dessert kinds, the following were capital:—Speedwell, Red Champagne, Bright Venus, Green Gascoigne, Keen's Seedling, Ironmonger, Broom Girl, Crystal, Whitesmith, Scotch Nutmeg, &c. Amongst a few dishes of red Currants La Hative, La Versaillaise, Warner's Grape, and Cherry Red, were very fine. Several dishes of Cherries, and a few of Apples and Pears, including ripe fruits of Citron des Carmes, Mdlle. Solange, and Doyenné d'Eté, completed the exhibit (Silver-gilt Knightian Medal).

Messrs. Geo. Bunyard & Co., Maidstone, had about fifty varieties of Gooseberries, displayed in shallow square chip baskets—a quite novel way of showing the fruits. The latter were of capital size and good quality, well maintaining the reputation of the firm (Silver Banksian Medal).

Messrs. W. Paul & Son, Waltham Cross, Herts, had Apricot trees in pots, carrying a fair crop, of the following varieties: Moorpark, Orange, Peach, Hemskirk, Royal, Breda, Blenheim, Beaugé Kaisha, and large early Montgamet. Apricots in a ripe state are bad travellers, unless gathered, and many had fallen in transit (Silver Knightian Medal).

Mr. John Walker, Thame, Oxon, had about three dozen dishes of Gooseberries, of creditable size and quality; also a dish of Walker's Magnum Bonum Red Currant, a very large-fruited variety (Silver Banksian Medal).

Mr. G. Wythes, gr. to the Duke of Northumberland, Sion House, Isleworth, exhibited some fruits of Laxton's Latest of All Strawberry, one which has been known for some little time, and one of the best late varieties of British Queen flavour. It was awarded a First-class Certificate. Also a number of Princess of Wales Peaches, and three fruits of a seedling Melon, small fruit, green-fleshed, and closely netted.

Mr. Owen Thomas, gr. to Her Majesty, Frogmore, sent three seedling Melons, all fair-sized fruits of pale colour, white flesh.

Mr. H. W. Ward, gr. at Longford Castle, Salisbury, exhibited a very fair sample of Carter's Daisy Pea, a capital free-bearing, dwarf, and erect-growing variety (Vote of Thanks).

Messrs. J. Veitch & Sons were awarded a First-class Certificate for Veitch's Main Crop Pea, a large variety, and an excellent cropper; they also exhibited a fruit of an Indian Cucumber, stated to be of fair quality.

J. Hawthorn Kitson, Esq., Elmet Hall, Leeds (gr., Mr. T. Bonsell), sent a fruiting-branch of Tomato Elmet Favourite, an unribbed, good-cropping variety.

Mr. C. F. Millar, London Road Nurseries, Chippenham, showed several varieties of Tomatos of the Perfection type; also the yellow Beauty of Wilts, one of the best of this colour.

A grand collection of Peas in eighty varieties, came from Messrs. H. Cannell & Sons, Swanley, the whole of which as field crops had been grown at Eynsford (Silver Banksian Medal).

Lecture on Filmy Ferns.

In the afternoon a paper on the above section of Ferns by Mr. J. Backhouse of York, was read by the Assistant-Secretary in the unavoidable absence of the author. The lecture commenced with a warm tribute to the attractiveness and delicate beauty such plants possess, and much regret was expressed that they had been so long and so generally neglected, and as bearing upon this point, it was stated that when their treatment was thoroughly understood—and it was not especially difficult, the plants may always be depended upon to furnish considerable delight. The beauty of the various forms, the translucency of some of the species, and the jewelled appearance they present when, as is usually the case the fronds are almost covered over with glistening beads of condensed moisture, make Filmy Ferns very distinct from any other class of plants. In speaking of them Mr. Backhouse included the allied genus Todea.

There are from 150 to 200 species and named varieties at present known, and the lecturer thought that a large field for work was here presented to augment such a number. About two-thirds of the known species were amenable to cool treatment, and recent experiments had proved that many of the species, such as Trichomanes radicans and others could be successfully cultivated on artificial rockwork in greenhouses, and in such positions where the great amount of moisture, which has generally been considered necessary for them, could not be obtained. Mr. Backhouse then gave details of a house that had been erected at the York nurseries, and where most of the species were grown with more or less success. The house was a lean-to, with roof sloping to the north, and was divided into three divisions, one of which was kept quite cool, and the others of intermediate and high temperatures. The compost most suitable to nearly all the terrestrial species, was that of peat and broken sandstone. It was better to surround the crown of each plant with stones, rather than with the soil. They should always be watered with great care, never forgetting that it was easy to apply more than they required. The atmosphere should generally be charged with moisture if the plants are in a house by themselves, and they will absorb a great amount of this moisture by their leaves. Soft-water must always be preferred to any other, and it is seldom advisable to wet the plants overhead. Many of the creeping species do well upon Tree Fern stumps, and this method was convenient. Amongst other advantages, it was mentioned that the ripe spores falling upon the Fern stumps would grow better than under different treatment. After all, the most important point which conduces to success or to failure is that of the atmosphere, which should be kept as far as possible of an uniform degree of humidity.

The lecturer then referred to the glass cases, in which they are often grown, where they are only visible when the case is opened. He thought that such a system was quite enough to account for the manner in which they had been neglected. They should be kept in such condition that they may always be seen. Mr. Backhouse said that those who had no other convenience for their culture might cultivate many of the species thoroughly well in a glass frame in the drawing-room or other windows, and mentioned the late Mr. Cooper-Foster as being one of the most successful of amateurs who had undertaken the culture of and become extremely interested in Filmy Ferns. In regard to insects it was stated that thrips would follow a dry atmosphere, and if seen they should be sponged off at once; and during summer, the pest will be baffled by adequate shading to the plants.

Dr. Morris (Kew), who occupied the chair, made many interesting remarks upon the subject, and also showed dried specimens of several species. We think it very unfortunate that amongst a crowded hall full of other exhibits, no attempt had been made by any

exhibitor to illustrate the lecture by means of living specimens of these beautiful plants, although they were specially requested to do so.

National Carnation and Picotee.

The Carnations and Picotees were largely represented on Tuesday last; and while many of the bizarre and flaked varieties were brilliant in colour, some of them were characterised by an amount of roughness—one of the incidents of the season; flowers were generally large, while the selfs and fancies were very fine. It was one of the most extensive exhibitions yet held, but the exhibits were sadly crowded, and there was a considerable amount of confusion, which might be avoided in some part. It is always an extremely difficult exhibition to report fully and at the same time correctly.

CARNATIONS.

Four collections of twenty-four blooms of Carnations were staged. Mr. M. Rowan, Manor Street, Clapham, was placed 1st with a very bright lot of flowers of generally good quality, he had P.F. Lady Mary Currie, C.B. J. S. Hedderley, R.F. Mrs. Rowan, P.P. B. W. Skirving, S.F. Martin Rowan, S.F. Constance Graham, P.F. George Melville, S.F. Sportsman, S.B. Robert Houlgrave, P.F. Gordon Lewis, very fine in colour; C.B. Master Fred, R.F. Thalis, S.F. Tom Macreath, P.P.B. Mrs. Gordon, P.B. Sarah Payne, and R F. John Buckton, several being in duplicate. 2nd, Mr. J. Douglas, Great Gearies, Ilford, who had several new varieties, such as C.B. Phœbe, S.F. Constance Graham, P.P.B. Autocrat, S.B. Radiant, P.F. Charles Henwood, P.P.B. Harmony, R.F. William of Wykeham, P.F. Agricola, S.F. Gregorian, S.B. John Crossland, &c. 3rd, Mr. C. Turner, Royal Nursery, Slough, with a stand of fine flowers, large, full, and bright, which some thought ought to have occupied a higher position.

The class for twelve distinct Carnations brought eight exhibitors, the 1st prize being taken by Mr. C. Phillips, Hamilton Road, Reading, who had capital blooms of R.F. Thalis, P.F. Charles Henwood, S.B. Edward Adams, R.F. Rob Roy, C.B. Fred. Phillips, S.B. Admiral Curzon, C.B. Phœbe, S.B. John Crossland, R.F. Lovely Mary, S.F. Sportsman, S.B. Robert Houlgrave, and R.F. Mrs. May. 2nd, Mr. A. J. Sanders, The Gardens, Bookham Lodge, Cobham. There were five stands of six Carnations, Mr. F. Nutt, The Avenue, Southampton, taking the 1st prize with fine blooms of P.F. Martin Rowan, C.B. Joseph Lakin, S.F. W. Dean, very fine in colour; R.F. Thalis, C.B. Edward Schofield, and S.B. Squire Potts; 2nd Mr. W. L. Walker, Reading, with a good stand of blooms.

As is usual, a great number of flowers were staged in the classes for single blooms, and of scarlet bizarres the best was Dr. Hogg, from Mr. C. Turner, a new variety of excellent properties; Mr. M. Rowan came 2nd, with Robert Houlgrave; of crimson bizarres, Mr. J. Douglas was 1st, with Phœbe; Mr. M. Rowan coming 2nd with J. S. Hedderley. Of pink and purple bizarres, the best was Edward Rowan from Mr. A. J. Sanders; Mr. M. Rowan taking the 2nd and 3rd prizes with William Skirving. Mr. F. Hooper had the best P.F., showing James Douglas; Mr. F. Nutt coming 2nd, with Billy Henderson. Of S.F.'s., Mr. C. Turner was 1st and 2nd. In the R.F.'s, Mr. C. Phillips was 1st, with Rob Roy; and 2nd, with Thalia.

The premier Carnation, selected from the whole show, was Dodwell's J. S. Hedderley, a very fine crimson bizarre.

Self and fancy Carnations were a very fine feature, some splendid blooms being staged. Mr. C. Blick, gr. to M. R. Smith, Esq., Hayes, Kent, was 1st, with King Arthur, Peregrine, Cardinal Wolsey, Germania, Mrs. Eric Hambrough, Eudoxia, Little John, George Cruickshank, salmon ground, flushed with white; Rose Unique, Waterwitch, Little John, Lady Wantage, King Arthur, Duke of Orleans, Mrs. A. Campbell, Mrs. John Bligh, Lady Mary Currie, Magpie, The Dey, and Fiery Cross, some being in duplicate. 2nd, Mr. C. Turner, also with a stand of very fine blooms; Hayes Scarlet, Marmie Murray, Meg Merrilies, Corunna, Duke of Portland, Louis Napoleon, and Cedric, being distinct from the foregoing. There were nine exhibitors in this class, and ten for that of twelve blooms. Mr. A. Jordan was 1st with Esmarch, Alice Alpres Hunter, King of Scarlets, The Burn, Germania, Artemus Ward, Vandyck, Primrose League, Niphetos, Ketton Rose, and seedlings. 2nd, Mr. C. Phillips, also with good blooms. With six blooms, Mr. J. F. Kew, Southend, was 1st with Mrs. L. C. Jamieson, Niphetos, Sunset Dodwell's 942, and two seedlings. Mr. F. Nutt was 2nd.

Plants in pots were represented by two collections, but they should be stood upon the floor, and not on tables, where they are above the line of sight. Mr. Martin Smith was 1st with some finely-grown and flowered plants of Miss Jekyll, Hayes Scarlet, Mrs. Seymour Bouverie, Eudoxia, Mephisto, Harmony, Mrs. Eric Hamburgh, Waterwitch, Cardinal Wolsey, Miss Audrey Campbell, Sir John Lubbock, and Little John; 2nd, Mr. J. Douglas, also with good plants.

A class for six Carnation and six Picotees, for those who had never won a prize for Carnations, brought no entry.

Prizes were offered for various arrangements, showing the decorative value of Carnations, Mr. J. Douglas taking the 1st prize for an epergne of white blush and pink Carnations, prettily arranged with foliage. Mr. Spurling, Blackheath, was 2nd. Mr. Goble had the best three sprays; Mr. J. Douglas, 2nd; but all somewhat heavy. Mr. C. Blick was 1st with six buttonholes, having six large self Carnations, one to each. Mr. J. Douglas was 2nd; but there were few among them a gentleman would care to put into his coat. A class for twelve blooms from any of the classes, each with a spray of Carnation foliage, scarcely showed the blooms to advantage. Mr. A. Jordan was 1st, and Mr. J. Douglas, 2nd. For six blooms, Mr. A. Greenfield, Sutton, was the only exhibitor, but no money prizes were offered in these classes.

Then followed what is known as the Martin Smith prizes for border Carnations, the best single bunch being a rim form of Lady Mary Currie, from Mr. J. Douglas; Mrs. Yones, Kensington, was 2nd.

The best six bunches of self-coloured Carnations came from Mr. H. W. Weguelin, Teignmouth, who had Comte de Bergmann, a purple self; Citterateur Marinaux, maroon self; Scarlet Ibis, soft bright scarlet; Madame Herrenschunal, pale rosy-pink; Oriflamme, bright scarlet; and Garville Gem, heliotrope colour. 2nd, Mr. T. Hooper.

Mr. Weguelin was also 1st with nine bunches of various types, having Mons. Brovland, white, slightly striped with crimson; Emilie Savore, blush, flaked with purple; Imogene, yellow ground; Madame le Carlier, yellow, heavily flaked with fiery rose; M. J. Yander, white, flaked rose; General Peppena, purple flake; Lizzie Williams, fancy; Madame Eleria a rose-edged Picotee, and Duc de Navalles, yellow ground. 2nd, Mr. J. Douglas, mainly with bizarre and flaked Carnations and edged Picotees.

Prizes were offered for seedlings, but one only appears to have been awarded, namely, to Y.G. Mrs. Douglas, from Mr. J. Douglas, clear pale ground, edged with pink, very pretty.

PICOTEES.

The pretty soft Picotees were seen to great advantage, and with twenty-four blooms Mr. C. Turner was placed 1st, with fine examples of H. Red E. J. B. Bryant, L.P.E. Clara Penson, H. Ro. E. Madeline, L. Ro. E. Favourite, L P.E. Sylvia, H. Ro. E. Mrs. J. Ricter, L. Ro. E. Little Phil, H. Ro. E. Mrs. Sharpe, H. Ro. E Lady Jane Churchill, H. Red E. Brunette, L. Ro. E. Lady E. Van der Weyer, L.P.E. Gazelle, L.P.E Lady G. Cathcart, H. Red E. Dr. Epps, L.P.E. Esther, H. Ro. E. Mrs. Payne, several being in duplicate; Mr. M. Rowan came 2nd, with twelve Picotees; Mr. C. Phillips was 1st, having good blooms of H. Ro. E. Little Phil, L. Ro. E. Estelle, H.P E. Muriel, H. Ro. E. Cordelia. H P.E. Zerlina, L. Ro. E. Favourite, L. Ro. E. Mrs. Barnett, H. Ro. E. Mrs. Payne. H. Red E. Morna, L. Red E. Mrs. Gorton, H. Red E. John Smith, and L. Ro. E. Mrs. Beale; 2nd, Mr. Arthur Medhurst. With six Picotees, Mr. F. Nutt came in a good 1st. with L. Ro. E. Favourite, H. Ro. E. Little Phil, L P E. Esther, H P.E. Amy Robsart, H. Red E. Isabel Lakin, and L. Red E. Thomas William. Mr. C. Braden, Ash, Dover, was 2nd.

Yellow-ground Picotees were, as usual, very attractive. The best twelve blooms came from Mr. J. Douglas, who had Harlequin, Ladas, Mrs. Douglas, W. Dranfield, Mrs. R. Sydenham, and seedlings. 2nd, Mr. T. E. Henwood, Hamilton Road, Reading, who had Mrs. R. Sydenham, Agnes Chambers, Edith M. Wynne, Diomedes, Eurydice, Cowslip, Aurora, Annie Douglas, Mrs. Henwood, Madame Van Houtte, Rosalinda, and one other. With six blooms, Mr. C. Phillips was 1st, having Mrs. R. Sydenham, Mrs. Henwood, Annie Douglas, Agnes Chambers, Countess of Jersey, and Madame Van Houtte. Mr. F. Hooper, Bath, was 2nd.

Single blooms of Picotees were numerous also, and in the heavy red-edged class Mr. J. Douglas was 1st, with Ganymede; and Mr. M. Rowan 2nd, with Brunette. L.R E.: 1st and 3rd, Mr. J. Douglas, with Mrs. Gorton; Mr. Rowan was 2nd, with the same. H.P.E.: Mr. Rowan was 1st; Mr. C. Turner 2nd, both with Muriel. L.P.E.: 1st, Mr. F. Nutt, with Pride of Leyton; Mr. J. Douglas was 2nd and 3rd, with Ann Lord. H. Rose E.: Mr. W. L. Walker was 1st, with Madeline; and Mr. C. Turner 2nd, with the same. L. Ro. E.: Mr. F. Nutt was the only exhibitor, taking the 1st prize with Ethel. With heavy Scarlet E., Mr. C. Turner was 1st and 3rd, with Madame Pitcher; Norman Carr, without an exhibitor's name, was 2nd.

The premier Picotee was H.P.E. Muriel, shown by Mr. C. Phillips.

Miscellaneous.—Exhibits of Carnations and Picotees came from Messrs. Veitch & Sons, about 160 blooms of various types; Messrs. Ivery & Son had Pride of Reigate, soft bright rose.

A very fine group of plants in pots was staged by Mr. C. Blick, gr. to M. R. Smith, Esq., representing seedlings of his own raising, all showing great vigour of constitution, superbly grown and grandly bloomed, and containing the following fine varieties: Miss Audrey Campbell, pale yellow; Duke of Orleans, pale yellow; Waterwitch, blush pink, paling to white—a lovely variety; Mrs. Eric Hambro, an extra fine white self (Award of Merit); Bendigo, purple; Miss Ellen Terry, creamy-white; Sigurd, salmon, shaded on the petal edge; Niphetos, white; King Arthur, bright scarlet, extra fine; Mephisto, deep crimson; Lady Ridley, a lovely pale variety; Coreador, blush, very fine; Delight, an invaluable border variety; Duchess, pale rose, very fine; Sefton, crimson, flaked with maroon; Honeymoon, white; Braw Lass, bright pale rose, &c. Other miscellaneous collections are noticed under Floral Committee.

EDINBURGH BOTANICAL.

July 12.—This Society held the last meeting of the summer session of 1894 on the above date, at the Society's Garden, there being a good attendance of members. Dr. W. Craig occupied the chair. The report of the proceedings of the council having been read, and new members balloted for, business was commenced by the exhibition of plants from the garden, amongst which were fine plants of Houstonia cœrulea, Pratia angulata, Primula involucrata, and Allium MacNabianum. Dr. T. B. Sprague showed peloriate flowers of Digitalis. Mr. Malcolm Dunn spoke as to this being not an uncommon occurrence in this plant. A diagram and specimen of a pouched leaf of Cabbage was shown by R. Turnbull. Prof. Balfour, keeper of the garden, remarking that the cup-like excrescences upon the leaves was not a rare occurrence, and commenting on the structure of the specimen shown. A report on the flora of Round Island, Mauritius, with an exhibition of the species found on the Island, was given by Surgeon-Major H. H. Johnston, who illustrated his paper by well mounted and preserved specimens. Several of the plants could not be identified owing to the inability of the collector to procure flowers of them at the time of his visit. A fruiting branch of a Mulberry tree grown as a standard, was shown by Mr. M. Dunn, this being an unusual case in Scotland; a letter was also read by the same member from Mr. C. Ross, of Welford Park, Newbury, giving the probable origin of the variegated Misleto, exhibited at the June meeting. Mr. Ross having given a large quantity of fruit of Misleto to the then manager of the Dean Cemetery, Mr. W. Cuthbertson, in 1855. The plants thus being nearly forty years of age. Mr. Lindsay in his report of the temperature and vegetation, stated that 288 species and varieties of plants had flowered in the rock garden; and the meteorological observations by Mr. A. D. Richardson showed the rainfall to have been greater than for the corresponding month of the three previous years. The highest reading of the thermometer in the case being 72°7, while the lowest reached 38°2. Mr. R. L. Harrow gave some notes on plants in the plant-house; and amongst the plants exhibited were Cyrtanthus Huttoni, Ornithogalum tenellum, Myrtus luma, Solanum Wendlandii, Gerbera Jamesonii, and Mitraria coccinea. The next meeting will be held at the Rooms in St. Andrew Square in November next.

TRENTHAM AND HANFORD HORTICULTURAL.

July 19.—The seventh annual exhibition of the above was held in the grounds at Trentham on the

above date. The gardens were looking their best, and on every side were visible the improvements which have been made in them during the past year. The Duke and Duchess, with a small house party, journeyed from London to visit the show, through which they were conducted by Mr. Blair, and were delighted with much that they saw on every hand. The show of the Trentham and Hanford Horticultural Society, although of such recent birth, has become one of the best in England, exhibitors coming from all parts of the country, its success being in great measure due to the patronage of the Sutherland family, and the assistance and advice which Mr. Blair freely affords. It has been favoured also from the first with fine weather, and the possession of a liberal prize-list. In regard to the show, no falling off was anywhere noticeable. The Roses were better than last season, and more numerously shown. Hardy herbaceous cut flowers made a very fine display; the groups were equal to those seen in former years, and the fruit was excellent.

Exhibits that call for special comment were the tuberous Begonias from Messrs. Laing & Son, Forest Hill, to whom the Gold Medal of the Society was awarded, besides First-class Certificates to many of the varieties. Another fine exhibit was the magnicent group of Souvenir de la Malmaison Carnations, exhibited by Mr. Blair, not in competition. This group consisted of more than 100 well-bloomed plants, and it was relieved by a background of graceful Palms. A Certificate of Merit was awarded to Mr. Blair for the group Bougainvillea glabra Sanderiana was shown by Messrs. F. Sander & Co, St. Albans; and Mr. C. Turner showed his Crimson Rambler Rose.

Of cut flowers of herbaceous plants and Roses, Messrs. Dicksons, Limited, Chester, staged a magnificent and varied assortment, consisting of forty-eight Roses in variety, Gaillardia Emperor, Scabiosa caucasica, masses of Carnations, including Mrs. R. Hole, White Pink Mrs. J. Welch, a great variety of Antirrhinums, Lilium auratum, Gladiolus The Bride, and many others.

Mr. H. Eckford, Wem, Shropshire, made a very beautiful display of more than fifty large vases filled with Sweet Pea flowers.

Mr. J. H. White, nurseryman, Broad Street, Worcester, staged, not for competition, an attractive and varied collection of twenty varieties of hardy annuals, eleven of Gaillardias, a stand of a lovely Japanese Iris and a new everlasting Pea, with pure white flowers on long stalks, a variety likely to be of great value in bouquet-making, Lupinus arboreus, and Prunus Pissardii in fruit.

Of fruits not shown in competition, mention may be made of eight Queen Pineapples, well grown and thoroughly ripened, from Mr. Gilman, gr. to the Earl of Shrewsbury, Ingestre Hall, Stafford. These were put into a setting of Adiantum cuneatum, and, being very fine examples, attracted much attention from the visitors.

The groups of plants were all that could be desired, and from the point of excellence now attained, little can be done unless some original and quite new arrangement can be brought out. The 1st prize was awarded to Mr. G. Edwards, gr. to the Duke of St. Albans, Bestwood Park, Arnold, Notts, for a group containing well-grown examples of Phœnix rupicola, Cocos, Crotons, Hæmanthus puniceus in bloom; Caladiums, Lilium candidum, Orchids, and a number of plants of Nertera depressa, &c.

Mr. Marriott, gr. to Mr. Finch, was 2nd, with a prettily-arranged group, consisting of much the same material as that in the 1st prize group.

In the competition open to persons employing only one gardener, the group of J. F. Mardock, Esq. (gr., Mr. Smith), contained good Cocos species, and Phœnix. Mr. Turvey, gr. to J. Williamson, Esq., was 2nd, his group containing a good specimen of the sweet-scented Tabernæmontana coronaria flore-pleno.

Roses were, perhaps, never seen better at Trentham, and the crowds round the stands so great as to render close inspection of the blooms impossible. The competition was very keen: 1st, Messrs. Perkins & Sons, Coventry, for forty-eight blooms, very fine being the varieties Margaret Dickson, Mrs. John Laing, A. K. Williams, Lady Sheffield, and Etoile de Lyon. The 2nd prize for the same was taken by The Cranston English Fruit and Rose Company, Hereford; and Mr. Merrywether, Southwell, was 3rd. The same exhibitors staged in the other classes, with flowers of fine form and substance. In the competition for decorative arrangement with Roses, the exhibits were exceedingly choice in some cases, but some were rather too heavy.

Cut Flowers and Hardy Herbaceous Plants.—Messrs. Cutbush & Sons, Highgate, London, received 1st prize; also a special prize, for a representative collection of hardy flowers, shown in much profusion. In this class Messrs. Harkness of Bedale were 2nd; and Messrs. Clibran & Son 3rd, with collections of great merit.

Fruit.—Mr. Gleeson showed well-ripened Bananas, capital Royal George and Bellegarde Peaches, Lord Napier Nectarines, Queen Pineapple, a Melon, Strawberries, Black Hamburgh and Muscat of Alexandria Grapes, and Negro Largo Figs, and was 1st; Mr. McIndoe, 2nd, with Grapes, Pitmaston Duchess Pears, Royal George Peaches, and a Melon; and he also took 1st prize for a green-fleshed seedling Melon, which has taken similar honours at York and Wolverhampton. The other collections contained fine Canon Hall Muscat Grapes, President Strawberries, Negro Largo and Brown Turkey Figs, Black Hamburgh, Duke of Buccleuch, and Foster's Seedling Grapes.

In the various classes for Grapes, the competition was keen, and the show may be said, in this respect, to have been the best of the season so far. For four bunches, two of each variety, Mr. Craven, gr. to Grant Morris, Esq., Allerton Priory, Liverpool, was well to the front, with superb Hamburghs, perfect in finish; and Madresfield Court, large in bunch and berry. This collection was also awarded the special prize of £2 offered by Messrs. Dickson, Brown, & Tait, for the best exhibit of fruit in the show for three bunches of Black Hamburgh.

Mr. Wilks, gr. to Mrs. Meakin, Cresswell Hall, Stafford, was 1st, with well-furnished excellent clusters. The special prize of £3 offered by Messrs. Dickson & Robinson of Manchester, for the best three bunches of Grapes, was awarded to this exhibit. The Muscats of Mr. Elphinstone, gr. to E. Millner Mundy, Esq., were well finished bunches in his usual good style, taking the 1st prize; Canon Coventry being 2nd.

In the class for any other variety, 1st, Mr. Gilman; 2nd, Mr. Allsop, gr. to Lord Hotham.

Amongst others who staged excellent lots were Mr. Bannerman, gr. to Lord Bagot; Mr. Chuck, gr. at Brodsworth Hall, Doncaster; and Mr. Bates, gr. at The Hays, Stone.

Mr. Allen, gr., Gunton Park, sent three boxes, not for competition, of Gunton Park Seedling Strawberry, a variety bearing carriage well.

Melons as usual were shown extensively, Peaches was good, Mr. Blair being 1st with a fine dish of high-coloured Bellegarde. The Nectarines were not so numerous as the Peaches; Cherries were not largely shown—the 1st prize for a dish was awarded to Mr. Reynolds, gr., Gunnersbury Park, Acton, for Biggareau Napoleon.

Strawberries were a thin class, and showed the effects of a showery season, some good British Queen from Yorkshire being passed over on account of bruising. Tomatos made an excellent show, also Cucumbers, and Mr. Gilman, gr., Ingestre Park, was 1st with Blair's Prolific. Very superior vegetables were staged, and Lady Theodora Guest's gardener, who seems at present to be invincible, secured the 1st prize in most classes of vegetables. Mr. Turner, gr. to Mr. Fitzherbert, Summerton Hall, took honours in the vegetable classes.

The cottagers, for whom the society came into existence, showed well, especially cut flowers; but fruits and vegetables, owing to the May frosts, were scarcely so numerous as formerly—still, Gooseberries, for which the district is famous, were as large and as good as ever.

The prizes for the best cultivated cottage gardens, given by the Duke of Sutherland, were keenly contested.

BARNET AND DISTRICT HORTICULTURAL.

July 19.—The third annual show of the above took place on this date, in the grounds of Hadley Manor. The entries numbered but few short of 600, being an increase of 200 over last year. The most noticeable increase was in cottagers' exhibits and those classes open to holders of allotments—a pleasing feature, the primary object of the Society being the encouragement of gardening among working people. As is now usual at shows, groups formed a prominent feature, and the principal plants used in Mr. Martin's, the winning group, consisted of Palms, Crotons, Ferns, Coleus, Begonias, Pandanus, and Isolepis. Mr. Fison's Gloxinias and Mr. J. H. Lorenz's Fuchsias were excellent specimens of good culture. Cottagers showed well, vegetables, window-boxes, and cut flowers.

MANCHESTER ROYAL BOTANIC.

July 21.—The annual show of Roses took place at the Botanical Gardens on the above date. The show was a good one, and there were many exhibitors from the southern counties. The following were among the principal prize-winners:—The Rev. J. Pemberton, Romford; Rev. W. H. Jackson, Stagsden Vicarage; Rev. F. A. Burnside, Hereford; Mr. W. Boyes, Derby; Mr. B. R. Cant, Colchester; Messrs. Harkness & Sons, Bedale; Messrs. Paul & Son, Cheshunt; Messrs. Mack & Son, Catterick; and Messrs. D. Prior & Son, Colchester. In addition to the competitive exhibits, there were many collections of flowering plants exhibited by local and other florists.

Mr. B. Cant, Colchester, took the leading place in the class for seventy-two distinct blooms, and was followed by Messrs. Harkness & Sons, Bedale. For thirty-six, the most successful competitors were Messrs. Prior & Son; Mr. B. R. Cant, in this case, following. Messrs. Prior & Son had the best twelve Tea or Noisettes also, Messrs. Mack & Son being 2nd. These last-mentioned exhibitors were 1st for twelve trusses of any white Rose, and Messrs. Perkins & Sons, Coventry, were 2nd. For twelve crimson blooms, Mr. R. B. Cant was 1st; and Messrs. D. Prior & Son 2nd. Messrs. Perkins had the best three bouquets of Roses.

In the amateur classes, the best thirty-six blooms were from Mr. W. Drew, Ledbury; and the Rev. J. Pemberton was 2nd. The Rev. W. H. Jackson, of Stagsden Vicarage, was 1st for twelve triplets; and the Rev. J. Pemberton 2nd. Teas or Noisettes in bunches of three, twelve varieties, were best from the Rev. F. A. Burnside, Hereford; and the Rev. W. H. Jackson followed. Mr. C. Burgess, Plumbley, was 1st for twenty-four distinct trusses, and was followed by Mr. J. Brown, Heaton, Mersey. Mr. J. Brown was 1st for twelve single trusses, and the Rev. J. H. Pemberton won in the class for twelve blooms of any crimson Rose. The Rev. W. H. Jackson in the class for twelve blooms of any white one was similarly successful.

The annual show of the National Pink Society (Northern Section) was also held on the same date and in the same place. The show was not a very large one, but there were some pretty blooms. The leading prize for twelve blooms of laced Pinks in not less than six varieties, was won by Mr. M. Campbell, Blantyre, and Mr. A. R. Brown, Birmingham, was 2nd. Mr. A. R. Brown had the 1st prize for six blooms, and Mr. Campbell followed. Most of the other classes were contested by Mr. Campbell and Mr. Brown, with the additions of Mr. J. W. Bentley, and Mr. J. Edwards.

TIBSHELF FLORAL HORTICULTURAL AND ROSE.

July 24.—This society, which is affiliated with the National Rose Society and the Royal Horticultural Society, held its nineteenth exhibition on the above date, in the charming colliery ground, Tibshelf, which lies exactly between Nottingham and Chesterfield; atmospherically the conditions were not pleasant, but still there was a large attendance of those interested in floriculture in Derbyshire and the surrounding counties. The Rose growers turned out in great force, and on all hands the verdict was given that it was the finest show of blooms that has been seen this season. The entries came from north, south, east, and west. Messrs. D. Prior & Son of Colchester carried off the 1st prize for seventy-two blooms, fifty distinct varieties, and the National Rose Society's Gold Medal; the Silver Medal of the same society going to Mr. George Prince of Oxford for forty-eight blooms, distinct varieties. There was a consensus of opinion that the exhibition would have done credit to the Crystal Palace, and the hope was expressed that the National Society would hold their show at Tibshelf, which is central and easily accessible from all parts. Most of the blooms were exceptionally clean and of good colour, and the judging was a difficult matter, no fewer than eight prizes having to be awarded in some classes. The most striking varieties were the Corinna Tea, Mrs. John Laing, Catherine Mermet, S.-M. Rodocanachi, Horace Vernet, Her Majesty, Madame G. Luizet, Gustave Piganeau, Baroness Rothschild, Innocente Pirola, and Madame Hoste. These were certainly the pick, and were all extraordinarily good.

The awards in the open classes were:—Tea and Noisette Roses, eighteen varieties, 1st, Mr. G. Prince; 2nd, Messrs. Prior & Son, Colchester; 3rd, Mr. B. Cant, Colchester.

Seventy-two blooms, fifty distinct varieties, 1st, Messrs. Prior & Son; 2nd, Messrs. Harkness & Son, Bedale, Yorkshire; 3rd, Mr. B. Cant.

Forty-eight distinct varieties: 1st, Mr. G. Prince, Oxford; 2nd, Messrs. Harkness & Sons; 3rd, Messrs. Prior & Son.

Thirty-six blooms: 1st, Messrs. Prior & Son; 2nd, Messrs. Harkness & Son; 3rd, Messrs. J. Townsend & Sons.

Amateur's classes.—Twenty-four blooms: 1st, Mr. Wm. Drew, Ledbury, Hereford; equal 2nd, the Rev. H. J. Pemberton, Romford, and Mr. E. B. Lindsell, Hitchin.

Eighteen varieties: 1st, Mr. W. Drew; 2nd, Mr. E. B. Lindsell.

Twelve distinct varieties: 1st, the Rev. H. J. Pemberton; 2nd, the Rev. W. H. Jackson.

There is always a keen competition here for grouping of plants, for which the monetary rewards of success range from £18. There were nine entries. Mr. J. Ward, gardener at Riddings House, Derbyshire, carried off the 1st prize with an excellently light arrangement of some of the finest hothouse flowering and foliage plants that could be brought together, the Crotons being indeed fine; Mr. A. Webbe, of Kelham Hall, Newark, was 2nd, but the plants were hardly so good; Mr. W. Shakespeare, a well-known amateur of Tibshelf, was a meritorious 3rd. The local classes were well filled, and the exhibition was in every respect, both in quality and exhibits, highly successful.

HAYWARDS HEATH HORTICULTURAL.

July 25. — This new society held a successful show on the above date, and as some fifteen parishes are amalgamated under the above title, the show was an extensive one. Groups of plants were a fine feature, consisting of miscellaneous plants and some wholly of Ferns.

Mr. T. Taylor, gr. to T. W. Oliver, Esq., Meads, Haywards Heath, was 1st for the former sort, and Mr. J. Pullen, gr. to W. Seville, Esq., Lindfield, for the latter. Mr. W. Knight, Haywards Heath, was 1st for stove and greenhouse plants. Of Gloxinias there was a fine display, and Mr. F. Baker, gr. to F. H. Broad, Esq., Burgess Hill, was 1st.

Roses and miscellaneous cut flowers, indoors and hardy fruit and vegetables were duly represented, and of, as a rule, excellent quality.

MARKETS.

COVENT GARDEN, July 26.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. Ed.]

Potatos.

Potato market firm. Prices vary from 3*s.* to 7*s.* per cwt. Old Potatos finished.

SEEDS.

London: *July* 25.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., state that transactions in farm seeds, as might be expected, are now few and small. New English Trifolium offers at low rates. Small orders come to hand for Mustard and Rape seed. There is rather more doing in Tares. Canary seed is for the moment somewhat quiet. Hemp seed keeps steady. Other articles at this inactive period afford no subject for remark.

FRUITS AND VEGETABLES.

Borough and Spitalfields: *July* 24.—Quotations:—Cabbages, 2*s.* to 2*s.* 6*d.* per tally; Carrots, 1*s.* 8*d.* to 2*s.* 8*d.*; Turnips, 1*s.* 6*d.* to 2*s.*; Parsley, 1*s.* 6*d.* to 2*s.* 6*d.* per dozen bunches; Onions, Egyptian, 3*s.* 6*d.* to 4*s.* 6*d.* per cwt.

Stratford: *July* 24.—There has been an abundant supply of all kinds of produce at this market during the past week, and, with a good attendance of buyers a brisk trade was done at the undermentioned quotations:—Cabbages, 1*s.* to 3*s.* 6*d.* per tally; Cherries, Dutch, 1*s.* to 2*s.* per basket; Cucumbers, 1*s.* to 2*s.* per dozen; Pears, 1*s.* to 1*s.* 6*d.* per molly; Turnips, 1*s.* to 2*s.* 6*d.* per dozen bunches; Carrots, household, 1*s.* 6*d.* to 2*s.* do.; Mangels, 18*s.* to 21*s.* per ton; Watercress, 6*d.* dozen.

Farringdon: *July* 23.—Quotations: Cabbages, 3*s.* to 4*s.* per tally; do, rough, 1*s.* 6*d.* to 2*s.* do.; Peas, good blues, 4*s.* to 5*s.*; do., rough, 2*s.* 6*d.* to 3*s.* per bag; Onions, 1*s.* 6*d.* to 2*s.* do.; do., Lisbon, 1*s.* 6*d.* to 2*s.* per dozen bunches; Turnips, 1*s.* 6*d.* to 2*s.* do.; Carrots, 1*s.* 6*d.* to 2*s.* do.; Broad Beans, 1*s.* 6*d.* per bushel. Fruit quotations nearly as elsewhere.

POTATOS.

Borough and Spitalfields: *July* 24.—Quotations ranged from 85*s.* to 100*s.* per ton.

Stratford: *July* 24.—Quotations:—Kidneys, 5*s.* to 7*s.*; Hebrons, 4*s.* 8*d.* to 5*s.* 8*d.*; Snowdrops, 6*s* to 9*s.*; Sutton's Early Regents, 4*s.* 6*d.* to 5*s.*; St. Malo Flukes, 5*s.* to 7*s.* per cwt.

Farringdon: *July* 23.—Quotations:—Kent Hebrons, £4; Essex Puritans, £4 to £4 10*s.*; Sutton's Regents, £4 to £4 10*s.*; Bedford Hebrons, £4 to £5; do., white Beauties, £5 to £5 10*s.*; do. Puritans, £5 to £5 10*s.*; Monarchs, £4 to £5 per ton.

London Averages: *July* 25.—English Hebrons, 80*s.* to 90*s*; Snowdrops, 70*s.* to 90*s.*; Kidneys, 80*s.* to 90*s.*; Rounds, 60*s.* to 80*s.* per ton.

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 110*s.* to 135*s.*; do., inferior, 80*s.* to 120*s.*; do., red, 75*s.* to 98*s.*; hay, best, 101*s.* to 130*s.*; do., specially picked, 138*s*; inferior, 80*s.* to 100*s.*; new, 70*s.* to 90*s.*; Mixture, 90*s.* to 127*s.*; and Straw, 43*s.* to 63*s.* per load.

CORN.

Averages.—Official statement of the average prices of British Corn, imperial measure (qr.), for the week ending July 21, and for the corresponding period last year:—1894: Wheat, 24*s.* 6*d.*; Barley, 19*s.* 6*d.*; Oats, 19*s.* 7*d.* 1893: Wheat, 26*s.* 5*d.*; Barley, 20*s.* 3*d.*; Oats, 21*s.* 9*d.*

TRADE NOTICE.

A Caution to the Trade.—We learn that a person has been calling on several of the seed firms in England, representing that he is a member of our firm, and that he is in temporary difficulties, and in one or two cases he has succeeded, we regret to say, in getting money on the strength of these and similar statements.

We think it only right to inform our friends that this man is a fraud pure and simple, and to warn them in the event of his calling. *Peter Henderson & Co., New York.*

ENQUIRY.

"He that questioneth much shall learn much."—Bacon.

Philadelphus and Syringa. — How, when, and where, originated the popular error, which denotes Philadelphus as Syringa? Is the same mistake made in other countries? There is nothing "pipe-like" in Philadelphus. *B.*

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Districts.	Temperature: Above (+) or below (−) the Mean for the week ending July 21.	Temperature: Accumulated, Above 42°, for the Week.	Temperature: Accumulated, Below 42°, for the Week.	Temperature: Accumulated, Above 42°, difference from Mean since January 1, 1894.	Temperature: Accumulated, Below 42°, difference from Mean since January 1, 1894.	Rainfall: More (+) or less (−) than Mean for the Week.	Rainfall: No. of Rainy Days since Jan. 1, 1894.	Rainfall: Total Fall since Jan. 1, 1894.	Bright Sun: Percentage of possible Duration for the Week.	Bright Sun: Percentage of possible Duration since Jan. 1, 1894.

The districts indicated by number in the first column are the following:—

0, Scotland, N. *Principal Wheat-producing Districts*—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. *Principal Grazing, &c., Districts*—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; *Channel Islands.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending July 21, is furnished from the Meteorological Office:—

"The *weather* was cool and very unsettled, with frequent showers in all districts. Thunderstorms occurred in Norfolk on the 18th, and over the northern parts of Great Britain generally on the 20th and 21st; the accompanying rainfall being in some cases rather heavy.

"The *temperature* was below the mean in all districts, excepting 'Scotland, N.,' the deficit amounting to only 1° or 2° in most places, but to 3° in 'England, E.' The highest readings were recorded on rather irregular dates, but mostly on the 20th and 21st, when the thermometer rose to 70°, or

a little above in most of the Wheat-producing districts, as well as in 'England, S.W. and Ireland, N.,' and to 75° in the 'Midland Counties.' At a large number of stations in the Grazing districts, the thermometer never exceeded 65°. The lowest readings which were registered at various times in the different districts, ranged from 40° in 'Scotland, E.,' to 49° in 'England, S. and Ireland, N.,' and to 55° in the 'Channel Islands.'

"The *rainfall* was less than the mean in the 'Midland Counties,' 'Scotland, W.,' 'England, S.W.,' and 'Ireland, S.,' and just equal to it in 'England, E.;' elsewhere there was a rather considerable excess. Amounts exceeding an inch were recorded at some of the stations in 'Scotland N.,' on the 17th.

"The *bright sunshine* showed a fair agreement with the average in 'Scotland,' but was very deficient in 'Ireland and England.' The percentage of the possible duration exceeded 25 in one district only ('Scotland, W.'), and was at or below 20 over a considerable portion of England. In 'Scotland, N.,' there was only 18 per cent. of the possible amount, and in 'England, S.,' only 17 per cent.'"

Answers to Correspondents

*** *Owing to the large increase in our circulation, we are reluctantly under the necessity of going to press some hours earlier. Our contributors, who well know what this implies, will kindly aid us by sending their communications as early in the week as possible. Communications should reach us not later than Wednesday.*

Books: *S. P. D.* Nicholson's *Gardeners' Dictionary*, published by Upcott Gill, 171, Strand, W.C.—*The Amateur Orchid Cultivators' Guide Book*, by H. A. Burberry, price 2*s.* 6*d.*, published by Messrs. Blake & Mackenzie, Liverpool. If you require a larger work obtain Williams' *Orchid Manual*, published at the Paradise and Victoria Nurseries, Upper Holloway, London, N.—*Cyclamens.* You should write to the author at the address given in our last issue.

Blackbirds Eating Fruit: *J. W. B.* We cannot recommend the use of poisoned wheat, it is both dangerous to other creatures and a cruel practice. Can you not net your bushes, or pass white cotton thread over them in all directions; or keep a boy to frighten them away with a clapper? but he must be out and about by daybreak, as it is in the quiet hours of early morning that these birds and thrushes commit much havoc with fruit of all kinds.

Cactus Dahlia: *F. C. Smale.* The true form, and the white very pure.

Carnation Mrs. A. Harkett: *A. H.* A capital bloom; full, well formed, nice shade of rose pink, and we think, one that is good enough for exhibition; or, at any rate, it would be an excellent border flower.

Cycas circinalis: *J. Birch.* The cone will bear only infertile seeds or none at all, unless there is a male plant in the neighbourhood.

Diseased Grapes: *N. H.* "Spot," which is extremely common this year, see p. 75 in *Gardeners' Chronicle* for July 21. Please send a leaf.

Dressing Vines in the Winter: *An Ignoramus.* We will let you know shortly.

Drift Seed: *S. H.* The seed found on the shore of the Isle of Wight is the seed of the Mango. It may have drifted from the West Indies or elsewhere, or it may have been thrown overboard from some ship. Your pupil should keep a look-out for similar waifs and strays, which are very interesting.

Grapes: *R M.* It is not shanking of the ordinary sort, for the berries are sweet and plump. The stalk has the appearance of having been twisted. Are all the bunches injured in the same manner?

Insects: *Thos. Bonsall.* To all appearance the nest of some species of Bombus (Humble Bee or Bumble Bee). The situation is unusual, and we shall be glad to see a specimen of the bee itself, which may possibly be seen to visit the nest. *R. McL.*

Kainite, &c: *C. W., Hull.* You could obtain this mineral manure from the large dealers in manures, probably in your town. We know of no work that gives the chemical analysis of plants (garden?) and fruits.

Fungus on Gentian: *G. H. G.* The fungus is Puccinia Gentianæ, figured in our columns by

Fig. 17.—Puccinia Gentianæ: a fungus affecting the leaves of Gentiana acaulis.

A, clusters of spores; B, C, teleutospores.

Mr. Worthington Smith on September 19, 1885. We advise you to burn your plants. We append an illustration, fig. 17.

Maréchal Niel Roses: *J. R.* The plants, introduced through the wall to the greenhouse, are exhausted with profuse blooming, aggravated probably by not being well supported by the use of manure-water during the period of bloom. The proper course would have been, had they been strong, to cut them hard back; but now it will be wise to mulch the soil over the roots, keep the shoots quite free from greenfly, syringe them night and morning for five or six weeks, and place a slight shade over the glass when the weather is bright. Another way of dealing with them would be to draw the canes out of the house, and secure them to short stumps driven into the border about 6 or 8 inches above the soil. If you cut back these weak stems the plants will die.

Names of Fruit: *Greenfield.* Cherry: so far as one may judge without seeing wood and foliage, it is Black Tartarian (Circassian). The fruit is rather large.—*T. C.* 1, Peach Grosse Mignonne; 2, a poor specimen, not recognised; 3, the fruit was crushed in box.

Names of Plants: *W. F. M.* Diplopappus chrysophyllus. — *R., Florence.* Flower crushed and pollinia gone; but it appeared to be Lælia xanthina var. agraphis, Rchb. f.—*W. E.* Triglochin maritimum.—*W. T.* Bambusa tessellata (B. Ragamowski of gardens), figured p. 167, vol. xv. of *Gardeners' Chronicle.*—*R. M.* 1, Lysimachia vulgaris; 2, Alchemilla vulgaris.—*C. B.* Veronica spicata.—*R.* 1, Sedum spurium; 2, Sedum album; 3, Sedum acre; 4, Sedum glaucum.—*Pilmuir.* Stenactis speciosa. We presume you mean Kennedya rubicunda, which is still in cultivation.—*G. M.* 1, Silphium laciniatum; 2, Philadelphus coronarius; 3, Vitis heterophylla variegata; 4, Funkia ovata; 5, Sidalcea malvæflora; 6, Nierembergia gracilis.—*T. C., Totteridge.* 1, Achillea Ptarmica, double; 2, Cephalaria tartarica.—*No name.* Calycanthus floridus.—*A. H. T.* 1, Digitalis lutea; 2, Stenactis speciosa; 3, Geranium sanguineum; 4, Cephalaria tartarica; 5, Lilium elegans; 6, a garden variety of Delphinium.—*C. G.* 1, Teucrium Scorodonia; 2, Campanula rotundifolia; 3, Caucalis infesta; 4, Hypericum pulchrum; 5, Agrimonia Eupatorium; 6, Jasione montana; 7, Carduus lanceolatus.—*W. H. S.* Campanula pusilla alba.—*Durham.* 1, Œnothera Youngi; 2, Agrostemma coronaria; 3, Lychnis chalcedonica; 4, Spiræa ulmaria, double fl.; 5, Œnothera grandiflora; 6, Gnaphalium margaritaceum; 7, Spiræa filipendula, double fl.; 8, Tradescantia virginica.—*A. P. S.* 1, Scrophularia aquatica; 2, Hypericum perforatum; 3, Equisetum arvense; 4, Epilobium montanum; 5, Picris hieracioides; 6, Artemisia maritima. Some numbers were detached, so you must check the names by a book.—*W. H. D.* has exceeded the number we undertake to name, but has enclosed a shilling for the Orphan Fund, for which we thank him. 1, next week; 2, Sanguisorba canadensis; 3, Epilobium angustissimum; 4, Collomia grandiflora; 5, Dicksonia pilosiuscula; 6, Lysimachia clethroides; 7, not recognised (Leguminosæ); 8, Comptonia aspleniifolia; 9, Digitalis lutea, with no flowers; 10, Campanula lactiflora; 11, Campanula latifolia; 12, Sedum Maximowiczii.—*C. W. C.* 1, Adiantum Waltoni; 2, A. affine (Cunninghamii); 3, A. concinnum latum; 4, Litobrochia biaurita; 5, Thalictrum minus; 6, Asclepias curassavica; 7, Stenactis speciosa; 8, Lastrea Sieboldi.—*D. W.* 1, Lonicera Ledebourii; 2, Centaurea macrocephala; 3, Œnothera Youngi; 4, Eryngium alpinum.—*G. D., Waterford.* 1, Adiantum cuneatum gracillimum; 2, Pteris cretica albo-lineata; 3, Cheilanthes frigida; 4, Nephrolepis exaltata; 5, Blechnum polypodioides; 6, Pteris serrulata cristata; 7, Adiantum hispidulum; 8, A. tenerum; 9, Selaginella Wildenovii.—*Mersey.* 1, Polystichum (Aspidium) angulare proliferum; 2, Athyrium filix-fœmina cristatum; 3, Scolopendrium vulgare crispum; 4, Athyrium f.-f. corymbiferum; 5, Trichomanes radicans; 6, Athyrium f.-f. plumosum.—*Tar.* Yours is a very fine variety of true Lælia xanthina. L. tenebrosa is now generally considered to be a distinct species.—*T. M.* Calycanthus occidentalis (Californian species).—*S. A. B.* Anthyllis vulneraria, a wild plant on chalky soil.

Notice to Leave Employment: *T. K.* We think that in your case a week's notice would suffice.

Rhododendron ferrugineum: *W. L, Glasgow.* The gall-like formation is due to a fungus, Exobasidium Vaccinii.

Roses A. K. Richardson and l'Idéale: *E. T. M.* We should suppose from the ill-developed bloom buds that the plants are suffering from poverty of the soil. You can do but little for them this season, beyond affording guano-water or liquid manure from the stables, diluted one-half with water, not oftener than once in seven or ten days. If the plants on being gently pulled upwards, are found to have little root-hold, the liquid manure must not be given, but the plants lifted late in October or early November, and replanted after pruning off down to the quick wood every root showing decay or unhealthiness. Use a loamy soil mixed with about quarter of rich manure, or what is perhaps better, loam only, the manure being supplied, until the return of vigour in the plants in the form of a mulch.

Smut on Black Currant Leaves: *L. G. P.* The appearances are due to a small fungus, Fumago, which does not appear to do harm.

Trees: *A. D. W.* Abies lasiocarpa (Hooker), and A. subalpina (Engelmann), are identical; A. Lowiana (Murray), and A. concolor (Veitch), are also identical. Abies concolor (Lindley and Gordon), is the true concolor. The American Larch, we know nothing about as a forest tree in this country.

Tomatos and Mildew: *T. D.* The plants and fruit are very susceptible to disease, but mildew is not one of them, neither would dryness of the soil induce it; on the contrary, dryness rather conduces to healthiness. Please send affected foliage.

Vines and the Evaporating Pans: *An Ignoramus.* The use of these has been discontinued by most of the best Grape-growers, moisture being supplied to the air in the vinery in greater or less quantity as may be demanded by outside conditions. One of the best remedies we know for insects in vineries is Richards' vaporising liquid, and the simple cheap apparatus used to distribute it. It disfigures no fruit, leaf, or flower, imparts no taste to fruit, and is very effectual as an insecticide.

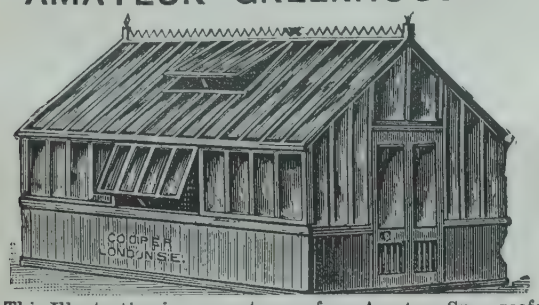
W. COOPER, LIMITED,

HORTICULTURAL PROVIDERS—*the Original Inventors of Cheap Greenhouses,*

755, OLD KENT ROAD, LONDON, S.E.

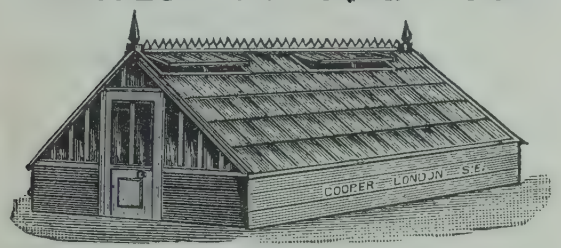


NURSERIES—HANWORTH AND FELTHAM.

The Largest Steam Horticultural Works in the World. Inspection invited.

1000 HOUSES IN STOCK to Select from.

Works cover 5 acres.



AMATEUR GREENHOUSES.

This Illustration is an exact copy of my Amateur Span-roofed Greenhouses, which are made of well-seasoned red deal. Complete with Ventilators, Irons for Opening, Staging, Glass, &c. Made in Sections, so that they can be erected by any gardener or handy man in a few hours. Simply screwed together. 7 by 5 ft., 56*s.*; 9 by 6 ft., £4; 12 by 8 ft., £6; 15 by 10 ft., £8 10*s.*; 20 by 10 ft., £12; 25 by 10 ft., £16.

Any size made. SEND FOR LIST, post-free.

AMATEUR FORCING HOUSE.

The utility of this house for forcing or cultivating Cucumbers, Tomatos, Melons, &c., will be perceived at a glance, it being a structure constantly in request, but almost hitherto unknown. See LIST, p. 22. Send for LIST, post-free.

HORTICULTURAL TIMBER.

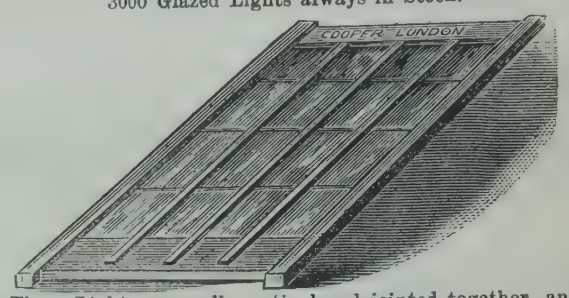
IMPORTANT NOTICE.

If Cooper's Greenhouses are not the Cheapest and Best, how is it they sell more houses in one month than all the other makers put together sell in one year?



Do not be misled by other people advertising houses at the same price as ours, as it is impossible for them to give such good value. Call at works and see the houses being made and the materials we use. We have only one establishment in the Old Kent Road, 747 to 755, on the left-hand side from City. Do not be misled by little ladder-makers and small house-decorators, styling themselves Horticultural Providers, and in some cases have no name up. Competition courted. Imposition hatred.

NOTICE TO OUR CUSTOMERS.

In answer to numerous inquiries, we regret to say no ordinary shares were offered to the public, the Directors taking the whole of them. A limited number of Preference Shares, which carry interest at £6 per cent., and are preferred as to capital, are available for issue. For terms of issue, apply to the Directors.

GARDEN LIGHTS.

3000 Glazed Lights always in Stock.

These Lights are well mortised and jointed together, and made in a good workmanlike manner, and are well worthy of inspection. Framework made of 2 in. by 2 in. styles, and properly rabbetted for the glass, with good 2 in. sashbars. The Glazed Lights are nailed and bedded in good oiled putty.

"INVINCIBLE" HOT-WATER APPARATUS.

Most Efficient and Cheapest in Existence.

Made in six sizes: No. 1, to drive 75 ft., £1 15*s*; No. 2, 100 ft., £3; No. 3, 200 ft., £4 10*s.*; No. 4, 275 ft., £7; No. 5, 375 ft., £7 15*s*; No. 6, 500 ft., £9; of 4-in. pipes.

Requires no sunk stokehole, and no brick setting. Will last all night without attention. Will burn house-cinders, therefore costs next to nothing for fuel. Anyone can fix it. A child can stoke it. Success guaranteed.

Cost of complete apparatus for Greenhouse with 4-in. pipes, flow and return along one side, cut and fitted; so that if the internal measurement of the Greenhouse is given, the apparatus will be sent completely ready for fixing, an advantage which will be appreciated by all. Securely and carefully packed on rail at the following respective prices:—7 ft. by 5 ft., £2 15*s.*; 9 ft. by 6 ft., £3; 10 ft. by 7 ft., £3; 12 ft. by 8 ft., £3 5*s.*; 15 ft. by 10 ft., £4 5*s.*; 20 ft. by 10 ft., £5 5*s.*; 25 ft. by 10 ft., £6 5*s.* See page 186 in List.

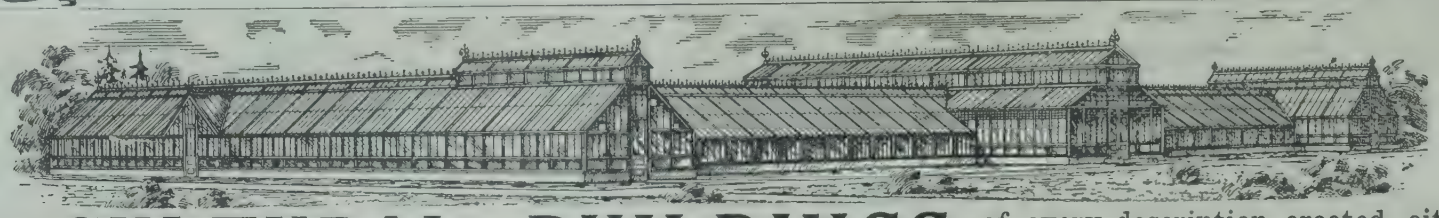
TO FLORISTS, &c.—Wanted by a Young Man (age 22), a situation in a Florists' Shop or Nursery. Five years' experience.—F. H., 4, Wellington Square, Hastings.



ANARCHIST ATROCITIES are becoming more numerous every day, and the indignation of every honest person is roused. These wicked and foolish men fancy they can remove troubles and abuses of our social system by deeds of violence! What a mad idea! One might as well expect to cure our bodily ills in the same way. But if we are troubled by any bodily complaint, what do we do? Why we choose mild and gentle methods to put ourselves right. We turn to HOLLOWAY'S PILLS and OINTMENT, and we find relief. There is no anarchical ferocity about their methods, and what is the consequence? Simply this, they never fail, they never miss their mark. Sickness and misery fly out of the window, and bright, cheery health comes in at the door.

SALES BY AUCTION.

Friday Next.

By order of Messrs. W. L. Lewis & Co., of Chase Side, Southgate,

An Importation of about 700

CATTLEYA AUREA

(the Gem of all the Cattleyas),

Including many grand pieces in exceptionally fine condition; and having been gathered in districts whence such treasures as Cattleya Hardyana Massowanii and kindred varieties emanate, it is only reasonable to expect that many fine hybrids and varieties will appear amongst these. All the plants received are offered.

Also about 40 plants of ODONTOGLOSSUM ROEZLII, best type, in magnificent order.

MESSRS. PROTHEROE AND MORRIS will SELL the above by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, August 10, at half past 12 o'Clock.

On view morning of Sale, and Catalogues had.

Friday Next.

Six Cases of ODONTOGLOSSUM ALEXANDRÆ (Pscho variety), received direct for Unreserved Sale.

An importation of LÆLIA TENEBROSA, CATTLEYA CRISPA, SOPHRONITIS GRANDIFLORA, ONCIDIUM CONCOLOR, O. FORBESI, and SCUTICARIA STEELI, from Messrs. F. Horsman & Co.

MESSRS. PROTHEROE AND MORRIS will SELL the above by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, August 10, at half-past 12 o'Clock.

On view morning of Sale, and Catalogues had.

Monday August 20.

DUTCH BULBS.—SPECIAL TRADE SALES.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION at their Central Sale Rooms, 67 & 68, Cheapside, London, E.C., as follows:—

MONDAY, August 20	... ...	over 2000 Lots
THURSDAY, August 23	... ...	,, 1800 ,,
MONDAY, August 27	... ...	,, 1500 ,,
THURSDAY, August 30	... ...	,, 1300 ,,

And SATURDAY, September 1, about 600 Lots.

Large consignments of named HYACINTHS, TULIPS, CROCUS, NARCISSUS, and other DUTCH BULBS, together with White ROMAN HYACINTHS, and Paper White NARCISSUS, received direct for unreserved Sale.

These early Auctions have been specially arranged in Lots to suit the trade and other large buyers. The Auctioneers will be pleased to enter the names of intending purchasers on their permanent lists, who may desire a regular supply of Catalogues for these Sales.

Auction Rooms and Offices, 67 & 68, Cheapside, London, E.C.

Sevenoaks, Kent.

UNRESERVED SALE of the whole of the EXHIBITION and other DECORATIVE PLANTS, ORCHIDS, &c., by order of Mrs. Laura Crawshay, who has given up exhibiting.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION on the premises, Bradbourne Hall, Sevenoaks, Kent, on THURSDAY NEXT, August 9th, at 12 for 1 o'clock precisely, the whole of the well-known and successfully exhibited STOVE and GREENHOUSE PLANTS, comprising fine specimen FERNS in variety, PALMS of Sorts, Allamandas, Ixoras, Lapagerias, Stephanotis; also grand examples of CYCAS REVOLUTA, 70 leaves, Dasylirion; 50 lots of ORCHIDS, viz., Cattleyas, Lælias, Odontoglossums, &c., together with Bouvardias, Camellias, Agapanthus, Caladiums, Callas, Spiræas, Violets, Deutzias, &c.

May be viewed any day prior to Sale. Catalogues may be had of Mr. JAMES GOODMAN, Gardener, on the premises, and of the Auctioneers, 67 & 68, Cheapside, E.C.

Note.—The above Plants have for years past annually taken prizes at the Sevenoaks and other Shows. All are in grand health and suitable for exhibitors and decorative purposes.

ESSEX.—In an important Market Town. Capital FREEHOLD NURSERY, about 2 Acres of Land, 5 newly-erected Greenhouses, specially adapted for Plant, Tomato, and Cucumber-growing. Suit beginner. Part purchase-money payable by instalments.

Particulars of Messrs. PROTHEROE AND MORRIS, 67 and 68, Cheapside, London, E.C.

RAYLEIGH, ESSEX.—Important to Market Gardeners and Seed Growers. About 100 acres of capital FREEHOLD LAND, excellent soil specially adapted for the growth of Market Garden produce, Nursery Stock or Seeds, the farm having the reputation of being one of the best in the county. Will be sold as a whole or in portions of 5 to 10 acres to suit the requirements of intending buyers. Immediate possession given on payment of deposit. The balance may be paid by quarterly instalments.—Full particulars of Messrs. PROTHEROE AND MORRIS, 67 and 68, Cheapside, London, E.C.

LONDON, N. (Folio 8245).—Capital NURSERY, comprising eight span-roof Greenhouses, well-heated; Stables, and other Outbuildings. Lease twenty-one years. Ground Rent £10. Price for the whole, including Stock, Glasshouses, and Utensils in Trade, £350. Ill-health reason for Disposal.—Full particulars of Messrs. PROTHEROE AND MORRIS, as above.

LONDON, S.E. (Folio 7640).—A NURSERY, of half an acre, with six Greenhouses, Pits, and Outbuildings. Good local Trade done. Lease thirteen years. Rent £10. Price £300. Open to an Offer.—Full particulars of Messrs. PROTHEROE AND MORRIS, as above.

SOUTH COAST (Folio 7905).—Walled-in NURSERY, of an acre in extent, 4 capital Greenhouses, and Outbuildings. Lease 93 years. Ground-rent, £15. Stock, about £200. Price for whole, £1600; £600 can remain.—Full particulars of Messrs. PROTHEROE AND MORRIS, as above.

WANTED, to RENT, for a term, a SMALL NURSERY, or PREMISES suitable for same. No stock required.—B., 394, West Green Road, Tottenham, N.

FREEHOLD LAND for SALE, suitable for Horticultural Purposes. Easy terms, if required. Full particulars of S. SINGLE, Land Agent, 20, Bucklersbury, E.C.

SMALL NURSERY for SALE, Cheap.—Eight Greenhouses, range of Heated Pits and Cold Frames, well-stocked; Eight-roomed Dwelling-house; facing main road. Close to railway-stations. Eight miles from Covent Garden. Long Lease. Low Rent. £35.—Apply to—B., 127, Mansfield Road, Gospel Oak, N.W.

SEED and NURSERY BUSINESS for SALE.—Sound going trade. Good premises and room for a large concern as a branch establishment. Particulars on *bonâ fide* application, to R. H. POYNTER, Seed Merchant and Nurseryman, &c., Taunton.

NURSERY for SALE.—Land 40 feet frontage, 100 feet deep; two Cucumber Houses, 40 feet by 10 feet; Conservatory and Tomato Houses, 20 feet by 15 feet; Numerous Pits and Houses. Good business connection with Gardening Implements. Good stock of Geraniums, Fuchsias, &c. Situated within 5 miles of Covent Garden. Price, £300. Long lease, or option of purchase of Freehold.

W. E. TAYLOR, 140, Trinity Rd., Wandsworth Common, S.W

TO MARKET GARDENERS or NURSERYMEN.—A Lady will LET, Rent £50 (or SELL, Price £1,250), her FREEHOLD RESIDENCE, 8 Rooms, and GARDENS, about 3 Acres, 4 Glasshouses, two heated; situate in centre of three large market towns in Oxfordshire. No similar business in neighbourhood; under a mile from Station to all parts.—Mrs. EVANS, Woodfield, Bicester, Oxon.

To Nurserymen and Florists commencing Business.

HAMPTON-ON-THAMES, on the Marling Park Estate, free from London fogs, a deep rich loam, the favourite neighbourhood for Growers. FREEHOLD LAND for SALE on easy system of Purchase, or to be LET on Lease.

For full particulars, apply to Mr. FREDK. G. HUGHES (Surveyor), the Estate Office, Hampton-on-Thames.

TO LET, on account of death, a Small MARKET GARDEN, containing about 4 acres, with House and Barn, and three good Glass houses, one well stocked with Grapes and the others with Tomatos and Plants; also good crop of Apples and Plums. Lease nine years to run. Rent, £45 per year.—For terms apply to Mrs. STARKEY, Bridge Road, East Moulsey, Surrey. No agents need apply.

Dursley, Gloucestershire.

TO NURSERYMEN, FLORISTS, MARKET GARDENERS, AND OTHERS.

TO BE LET, with Immediate Possession, at a moderate rental, the DURSLEY NURSERY, situate at Woodmancote, Dursley, about a quarter of a mile from Dursley Station, on the Midland Railway, consisting of a substantial and roomy brick-built Dwelling-house, with a convenient Shop, with plate-glass front, stable, coach-house, potting sheds, and 2 acres of rich, clean, well drained, and good working Land.

The above Nursery has been in the possession of, and a lucrative business carried on by Messrs. John Morse & Son, during the past 40 years. There is a good local business, and a widespread and well-known connection for the sale of cuttings and plants of Florists' Flowers throughout Great Britain and Ireland, for which the Nursery has long been noted, and there is a considerable trade in Cut Flowers, Furnishing, &c., and every convenience for a Retail Seed Business.

The premises are abundantly supplied with good water.

The whole of the Stock-in-Trade, thirteen Glass-houses, five long rows of Pits, three Upright Tubular Boilers, and other fixtures, to be taken at a valuation.

To view, apply on the Premises; and for further particulars to Messrs. D. LEGGE, SON, AND PEARCE, Auctioneers, Berkeley; or to Messrs. VIZARD, WENDEN, AND SON, Solicitors, Dursley.

Fifty Nurseries, Market Gardens, Florist and Seed BUSINESSES to be DISPOSED OF.

MESSRS. PROTHEROE AND MORRIS' HORTICULTURAL REGISTER contains full particulars of the above, and can be obtained, gratis, at 67 and 68, Cheapside, London, E.C.

CHRYSANTHEMUMS.

All Gardeners who hope to have really fine blooms this autumn will now be beginning to feed their plants. The best of all Manures for this purpose is "PEARSON'S CHEMICAL," as it is a perfect plant food, has no offensive odour, and is always perfectly identical in composition, so that its use once learned there is no further risk or trouble in applying. Some of the finest exhibition blooms shown in the Midlands have been grown by its aid alone, without any other fertiliser. In wet weather a teaspoonful to each plant may be sprinkled on the surface of the soil, but we ourselves prefer to use it as a liquid, our method being to dissolve a 6-inch potful in a 36-gal. tub, this being afterwards used at the rate of 2 gals. in each water-barrow (25 gals.). Gardeners are cordially invited to call and see our plants, and judge of the effect for themselves. Price and all information free on application.

J. R. PEARSON & SONS,
CHILWELL, NOTTS.

ARMITAGE BROS.

Have received, in SPLENDID CONDITION for FORCING, their first consignment of FRENCH BULBS, which they offer at the following specially MODERATE PRICES:—

	Per 100.	Per doz.
HYACINTHS, White Roman, 1st size ...	15*s.* 0*d.*	2*s.* 0*d.*
,, ,, 2nd size ...	11*s.* 0*d.*	1*s.* 6*d.*
,, Blue Roman	9*s.* 0*d.*	1*s.* 3*d.*
FREESIAS, refracta alba	6*s.* 0*d.*	1*s.* 0*d.*

STRAWBERRIES

LAXTON'S "ROYAL SOVEREIGN."

An earlier higher quality and Improved Sir J. Paxton

Three Medals and Five First class Certificates awarded.

All must have the finest early Strawberry yet introduced. Fruit of the largest size, brighest glossy scarlet colour, flavour rich (quite equal to British Queen), ripens with Noble; a splendid cropper and grower, and we consider it to be the long-sought EARLY HIGH-FLAVOURED AND IMPROVED SIR J. PAXTON, a splendid forcer, and in every way worthy of its name. Handsome coloured plate, now ready, 6*d.* (gratis to customers).

12*s.* per doz., £3 per 100; in pots, 18*s.* per doz., £4 per 100.

LAXTON'S SENSATION.

First-class Certificate Gardening and Forestry Exhibition, May 10, 1893.

An enormous second early variety of good flavour, and probably the largest Strawberry ever introduced. A remarkably strong grower, and producing fruit in wonderful clusters. Will prove a welcome addition to the list of good sorts. Forces splendidly.

20*s.* per 100, 4*s.* per doz.; in pots, 30*s.* per 100, 6*s* per doz.

LAXTON'S SCARLET QUEEN.

(First-class Certificate)

The best first early—very early. Fine colour and shape, and the richest flavour. Habit strong, a very prolific variety, a splendid early table and market fruit.

10*s* per 100, 3*s.* per doz.; in pots, 18*s.* per 100, 4*s* per doz.

LAXTON'S LATEST OF ALL.

The best late Strawberry, and the largest and best late variety. A seedling from British Queen, but much later. Flavour grand.

8*s.* per 100, 2*s.* per doz.; in pots, 16*s.* per 100, 3*s.* per doz.

The following best varieties for forcing or early planting can be supplied STRONG in pots at once:—

	Per 100.		Per 100.
A. F. Barron	15*s.*	King of Earlies	15*s.*
Nicaise	15*s.*	Grosse Sucrée	16*s.*
British Queen	15*s.*	Latest of All	16*s.*
Dr. Hogg	16*s.*	Noble	16*s.*
Jas. Veitch	15*s.*	President...	15*s.*
Ruskin	16*s.*	Napier	15*s.*
Commander	16*s.*	Paxton	15*s.*
Competitor	16*s.*	Viscountess	15*s.*
Keen's Seedling... ...	15*s.*	Waterloo...	16*s.*

Also, strong Open Ground Runners can now be supplied at usual prices, of—

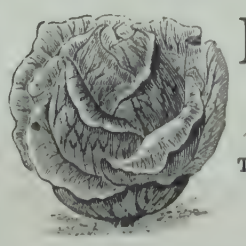
Nicaise, Sucrée, Vicomtesse, British Queen, Paxton, President, Albert, Captain, King of Earlies, Marguerite, Dr. Morère, Dr. Hogg, Stirling Castle, Sharpless, A. F. Barron, Waterloo, Countess, Jas. Veitch, Unser Fritz, Elton Pine, Lucas, Filbert Pine, and all other best sorts. English and Foreign (about 200 varieties in stock). Full LIST on application to—

LAXTON BROTHERS, BEDFORD.

LATE STRAWBERRIES.

Let us sing to the praises of three late Strawberries.

FROGMORE LATE PINE, which is absolutely the flavour of Ripley Queen Pineapple, sturdy in growth, large in size, and an abundant cropper. 7*s.* 6*d.* per 100.



OXONIAN, true, not Eleanor, which it is generally supplied for. It is simply an enormous cropper, rather sharp in taste, and the latest Strawberry on record. 5*s.* per 100.

Now comes lastly, but not leastly, that good old public servant, ELTON LATE PINE, warranted true; no other Strawberry like it for preserving.

All the New Strawberries supplied, all warranted true, and the best plants in the trade.

R. GILBERT, Burghley, Stamford.

WEBB'S'

THE

Gardeners' Chronicle.

SATURDAY, AUGUST 4, 1894.

THE FRUIT CROPS.

(See pp. 119—125.)

THE tabular report on the condition and prospects of the Fruit Crops in Great Britain and Ireland for the present year, will be read with interest, not only for its intrinsic importance commercially and economically, but also by reason of the peculiar climatal conditions to which the trees have been subjected. Before entering on that subject, it is incumbent on us to offer our thanks and those of our readers to the very numerous correspondents, from Orkney to Scilly, from Galway to Kent, who have so kindly responded to our enquiries. Their numbers, their experience, and their capabilities will go far to outweigh the inevitable vagueness of general statements; whilst the remarkable substantial agreement of the reports, as a whole, shows that, though not capable of precise mathematical demonstration, the words "average," "over," and "under," do really represent a very close approximation to the truth. Moreover, the majority of the reporters have been in the habit of filling in similar forms for us for many years, so that as much uniformity of statement is secured as is possible under the circumstances. In future numbers we shall publish the more extended remarks with which we have been favoured. In the meantime we may briefly allude to some of the more prominent features revealed by an inspection of the Report, and we would fain hope that some one with more leisure and opportunity than we possess, will analyse the report more fully with reference to climatal and other details, as we are convinced that valuable information from a physiological, and therefore from a cultural point of view, may be extracted from it.

Gardeners are not likely to forget the season of 1893, and the excellent conditions under which the wood was ripened last autumn. This gave good auguries for the abundance of the crop this season, and when spring came the trees were indeed robed in splendour beyond average. And then came that terrible frost in May, which recalled to every Shakespearian the famous speech of Wolsey, and we all trembled for the result, with what justification we now proceed to show. We omit from our present purview Peaches, Apricots, small fruits, and Strawberries, not by any means as devoid of interest, but because statistically they are of less importance than the others. Arranged in numerical order the results come out as in the accompanying table:—

SCOTLAND.

No. of records ...	Apples (66)	Pears (64)	Plums (68)	Cherries (67)	Nuts
Average ...	10	21	24	45	—
Over	2	13	3	7	—
Under	54	30	41	15	—

ENGLAND, WALES, IRELAND, &c.

No. of records ...	(245)	(246)	(248)	(242)	(176)
Average ...	33	89	85	126	60
Over	0	108	53	25	67
Under	212	49	110	91	49

From this we see that Apples are so greatly deficient that no fewer than fifty-four reporters in Scotland and 212 in England and Ireland,

report a small crop. Only two in the whole kingdom mention a crop above average, and those two are in Scotland!

With regard to Pears, an almost equally remarkable result is record, but of an opposite character, Pears being almost everywhere abundant, the figures for Scotland being 21 average, 13 over average, and 30 under. In England the results are more favourable: 89 being average, 108 over average, and only 49 below it. It must be remembered, however, that Pears are often grown on walls, and that in the tabular statement this fact is not always mentioned, though it is so in the reports we shall have to make later on.

Plums are generally deficient. Cherries, on the other hand, are remarkably abundant, there being forty-five "average" reports from Scotland, and no fewer than 126 from England, &c.

Nuts are not much grown in the northern counties, but in the south they are rather above average; Walnuts, however, suffered from the frost; Strawberries have been universally scarce and bad in quality; Currants, Raspberries, and Gooseberries, fairly good. These are the main facts, but there are abundant materials for that more searching analysis to which we have already alluded, and in subsequent issues we shall publish the comments with which our correspondents have favoured us.

New or Noteworthy Plants.

Cypripedium × denisianum (selligerum × superbiens).

A fine three-flowered inflorescence of this massive and striking hybrid, named in honour of one of the sons of Monsieur A. Madoux of Auderghem, Brussels, whose fine collection of Orchids was reported in the *Gardeners' Chronicle*, April 7, 1894, comes from Messrs. Linden, l'Horticulture Internationale, Parc Leopold, Brussels, and as its parentage has been wrongly recorded, the present remarks will be useful. When I first saw it in Brussels last spring, I find I mentioned it in my notes as being of the C. × Morganiæ class, but larger, firmer in texture, and with broader petals, more thickly spotted than in C. × Morganiæ, and as a rough description that answers very well. The leaves are fleshy, and of light green colour, with obscure dark green markings. The stout, purple, hairy flower stem is over 1 foot in height. The flowers have the upper sepal nearly 2 inches wide, white, with a pale green base, surmounted by a broad rose-coloured band, and having numerous purple lines radiating from the base; lower sepals similar, but smaller. The petals are 4 inches long and three-quarters of an inch wide, ciliate at the edge, ivory-white, flushed with rose, and bearing some ten rows of purple spots. The lip large, greenish-white, with a faint lilac hue; the staminode greenish-white, veined with emerald green, and bearing short purple hairs. It is a distinct advance in its section upon C. × Youngianum and others of its class. *James O'Brien.*

Sobralia xantholeuca, Wigan's variety.

The above is a charming variety of the large, yellow-flowered Sobralia xantholeuca, with which it was imported, its delicate tints being quite remarkable in Sobralias, or, indeed, in any large-flowered Orchid which I can call to mind. The sepals and petals are creamy-white, with, in places, a slight pink tinge. The large labellum is also creamy-white, the interior of the tube formed by its folded sides being bright chrome-yellow, a faint tinge of which is spread over the front of the lip, the surface of which also is of pale lilac, which mingles with the yellow, and overlays the cream-white ground, producing a tint not easy to describe in words. It flowered in the collection of F. Wigan, Esq., Clare Lawn, East Sheen, Richmond.

Hard-wooded Greenhouse Plants.

(*Continued from p.* 36.)

Acrophyllum venosum.—This is a very fine plant, which, as regards general cultural detail, does not vary materially from that laid down for Darwinias, but, comparatively speaking, it is a more difficult plant to cultivate, a well-managed specimen of it always pointing to high-class culture. Some years back it used to be shown during the month of May in beautiful condition, one of the best growers of it being Mr. Chilman, when gardener at Ashtead, Surrey. It has one peculiarity, viz., that of starting into fresh growth from the point of each of the flower-spikes, which are dense, superficially of Spiræa-like appearance, and pale pink in colour. Care is needed in looking after all back breaks and side-shoots, otherwise the height of the plant increases too rapidly. White-scale, thrips, and red-spider are its greatest enemies, and these must be exterminated, or at least be kept in check if success is to be achieved. Too dry a situation is conducive to the spread of the two last-named insects, which shows that the syringe should be used frequently. White-scale may be kept down by hand-picking, or by using an insecticide when the growths are well-hardened. Plenty of light should be afforded to prevent the young shoots from being drawn, but only in the most favourable situations should it be stood outside during the summer months. *James Hudson.*

(*To be continued.*)

Lycaste Schönbrunnensis ×.

This interesting hybrid was shown at the last meeting of the Royal Horticultural Society by Messrs. F. Sander & Co. (fig. 18). It was raised by Mr. Umlauft, the head gardener at the gardens of the Emperor of Austria at Schönbrunn, the parentage being stated to be L. gigantea × Skinneri. In the *Orchid Review*, February, 1893, Mr. Rolfe suggests L. Skinneri × Schilleriana. In any case a very pretty garden hybrid of unusual colouring has resulted.

Fig. 18.—Lycaste Schönbrunnensi- ×.

In its stature, and in the habit of its growth, L. schönbrunnensis much resembles L. Skinneri. The flowers have the sepals of firm texture, and of a peculiar brownish-rose colour. The petals are yellowish-white, suffused with rose-pink on the outer halves. The lip is light yellow at the base, spotted with purplish-crimson, and bearing a thickened callus; column white. It was exhibited by Messrs. F. Sander & Co. of St. Albans at the Royal Horticultural Society, July 24, and received an Award of Merit.

REPORT ON THE CONDITION OF THE FRUIT CROPS.

[FROM OUR OWN CORRESPONDENTS, AUGUST, 1894.]

The words "average," "over," or "under," as the case may be, indicate the amount of the crop; and "good," "very good," or "bad," indicate the quality.

The counties are arranged in numbered groups, to correspond with those adopted in the Weather Reports of the Meteorological Department, and followed in our weekly Weather Tables.

*** **Fuller comments will be given in the following numbers.** See also Leading Article on page 117.

CROPS AT SEVERN STOKE.

It is not my intention to enter into detail respecting this remarkable garden, the property of the Rev. Canon Coventry; some subjects, however, are worthy of special notice. The range of vineries is about 150 feet long, divided into two compartments. At the time of my visit, July 6, the late house had not passed the stoning period, while those in the early compartment were ripening up, and, indeed, some of the bunches had already done duty at exhibitions. The early house is about 100 feet long, and consisted of such varieties as Madresfield Court, Black Alicante, Gros Colmar, Black Hamburgh, Muscat of Alexandria, and Sweetwater. The Vines were carrying heavy crops; notwithstanding which, the bunches were large, and the berries plump and well developed, and those that were ripe were well finished. The best bunches of Black Hamburgh would average 3 lb.; one bunch I noticed would no doubt turn the scale at 5 lb.; the Gros Colmar would run 4 and 5 lb. each, and the Muscat of Alexandria about 4 lb. each. Some of the finest bunches of Black Hamburgh were on Vines forty years old; one cane was taken to the top of the house, and then two branches were trained horizontally in opposite directions, and from these branches the finest fruit was obtained. The Muscats were in splendid form, those Vines carrying the largest bunches being twenty-five years old. Mr. Frowd, the head gardener, evidently understands the nature of the Vine, and the treatment required for the production of fine Grapes.

Turning into the Fig-house, I found the second crop, a prodigious one, was fast ripening. The principal variety grown is Brown Turkey. In the five low span-roofed houses devoted to Cucumber-growing, the plants were in luxuriant health, being grown on the so-called express system. A good bed is made at first; the plants maintained in a healthy condition, are made enormously productive; the houses are kept close, and no air being afforded, growth is very rapid. Mr. Froud keeps his plants at all times exposed to sunlight, with a temperature ranging from 90° to 120°, and an atmosphere saturated with moisture. The Cucumber plants are looked over daily, each shoot stopped when it has made two or three joints, and the fruits cut before they come to maturity. After a big cutting, the young fruit may almost be seen to grow, so rapid is development; and further, the produce is considerably increased, as well as the quality greatly improved by this practice. With the high temperature maintained, and the great amount of humidity in the houses, the plants are free from insect pests of all kinds, and of disease. When the plants show signs of exhaustion they are well cut-back, the beds top-dressed with decayed manure, and afforded liquid manure in large quantities, and some small amount of air is given for a day or two while they make fresh growth, and in a short time the plants are again bearing as heavily as before. Tomatos may be profitable to grow under glass; but to use a common phrase, they cannot touch Cucumbers when they are grown according to the methods practised at this place.

Mushrooms are grown quite as well as the Cucumbers, Grapes, or Figs. These are not cultivated in well-arranged Mushroom-houses, where there is every convenience in the way of heating appliances, but in underground caves or quarries. In one part of the garden there is a high sloping bank, into which Mr. Froud has burrowed and formed subterranean caves; there he has made his Mushroom-beds. The roof is held up by thin boards, supported with props, and the entrance is by a narrow door. Several of these caves have been formed; when I called there recently, another had been commenced at the side of those already in existence, which was intended to connect them altogether, when they all might be traversed from one entrance. The beds are made on the ground; the temperature of the caves is warm in winter, and cool in summer, just right for the Mushrooms during the period they are cultivated; there is, therefore, no artificial heat required, neither damping nor any of the routine duties required in a Mushroom-house. The beds produce enormous crops of Mushrooms, and they continue in bearing four or five months, and when they become exhausted, as will then occur, they are watered with tepid water, in which a little salt and guano is mixed, and this sets them going again. A slight sprinkling of salt is also mixed with the manure at the time of forming the beds, which is also of much benefit to the Mushrooms.

Besides the above, I noticed fine crops of Cherries on pyramidal trees, 8 or 9 feet high, covered with nets to protect them from the birds; Raspberries and Gooseberries were also in fine condition; as was a batch of Chrysanthemums, containing sorts new and old; the plants strong, and giving promise of fine flowers in the season. *Quintin Read.*

The Week's Work.

PLANTS UNDER GLASS.

By J. F. McLeod, *Gardener, Dover House, Roehampton, S.W.*

CARNATION SOUVENIR DE LA MALMAISON.—If the directions given on p. 754 of the last volume have been carried out, the layers will now be sufficiently forward for severing from the parent plants and potting in their flowering-pots, which may range from pots of 5 inches to 7 inches in inside diameter, according to the strength of the plants. I have discarded the practice of placing them first in 60's, as it is, in my opinion, useless. When the sparingly-rooted layers are placed in 5 and 7-inch pots, the drainage must be in good quantity, and carefully placed in the pots; the soil used should be the best of its kind, and the after-watering carefully performed. I have found that for this potting, a soil consisting of two parts fibry loam, broken with the hand, one of peat, similarly treated, and the remaining fourth to consist of equal parts of charcoal, sand, mortar rubbish, and soot, is very suitable. The potting soil should incline to dampness when used, and no water should be afforded at the root for a few days after potting, the damping of the foliage with the syringe sufficing; water, when resorted to, should be sufficient to moisten the whole mass of soil, and no more will then be required for a considerable time. A suitable place for the plants at this stage is one with a north-east or a north aspect, the pots being stood in a bed of coal-ashes, and the frame kept rather close till growth recommences, when more and more air must be admitted by degrees, and at the sixth week after potting full exposure may take place in fine weather. The plants will benefit by frequent light syringing in fine bright weather.

PRIMULAS.—Those of the double-flowered section, which may be growing in 60's, should be repotted into 5½-inch pots, making use of a light rich soil, plenty of sharp sand, and a small quantity of charcoal. Afford the plants plenty of air, frequently damp the sides and bottom of the frame or pit, and shade the plants from bright sunshine during the warmest part of the day.

EPACRIS, which have made satisfactory progress, may be placed in a sunny position out of doors, to ripen the newly-made shoots; and to prevent the entry of worms, stand the pots on boards or on inverted pots, if the situation is such as will not permit of coal-ashes and soot being laid down. Continue to pinch the shoots of Bouvardia, Plumbago capensis, and Euphorbia jacquinæflora, standing the plants wide apart. Salvia, Eupatorium, Lantanas, &c., must be similarly treated to the above. The moist season is causing a gross growth, which must be checked by a somewhat severe pinching of the stronger shoots.

MIGNONETTE-HOUSE.—Sow six good seeds in a thumb-pot, or more if the seed be not good. Use a rich soil, and stand the pots in cold frames. For general usefulness, Miles's hybrid Spiral is hard to beat; whilst if large heads of bloom are desired, Matchet, Bird's Mammoth, or Queen Victoria, are excellent. The flowers will succeed those from plants in the open air.

CELOSIA, GLOBE AMARANTH, AND BALSAM required for late flowering should be encouraged to grow by the frequent application of well diluted farmyard manure-water or clear soot-water.

MISCELLANEOUS.—Rooted cuttings of Lasiandra (Pleroma) macrantha, and Libonia floribunda, may be potted into 5-inch pots, using a rich loam two parts, one part old Mushroom-bed manure, and one of sharp sand, place in a frame, and afford a treatment similar to that advised for Primulas. Seedling Calceolarias and Campanulas may be transferred to thumb-pots, using a peaty soil, which has been passed through a ¼-inch sieve; stand them in a frame having a northern aspect, shade from sunshine during the afternoon, and if the position be a damp one, so much the better.

THE HARDY FRUIT GARDEN.

By T. Turton, *Gardener, Maiden Erlegh, Reading.*

FIG TREES ON WALLS.—The shoots for which there is space in which to lay them in without crowding, should now be fastened to the wall, the side-shoots being removed, the leading shoots left unstopped, and the shoots at their base being left to furnish the tree. If mice are troublesome, as is sometimes the case, traps must be used, and nets should be placed over the trees to keep blackbirds and thrushes from the fruits.

PEARS.—Old trained trees, and standards in orchards and gardens, if heavily cropped, may receive a good root-watering with liquid-manure of some kind, diluting it more or less according to its strength, and the nature of the land. Land that is well-drained, naturally or artificially, or which has a gravelly subsoil, is much benefited by such applications. In this district old trees of Louise Bonne of Jersey and Williams' Bon Chrétien bear very heavy crops this season, and manure-water will have a good effect on the crops of these varieties, if afforded forthwith. Early varieties growing on walls, or as bushes and espaliers, should be protected by nets from the depredation of the birds.

STRAWBERRY PLANTATIONS.—Where runners have not been secured for forming new plantations, they may still be taken from the mother-plants, and dibbled-in on a shady border in rows of 1 foot apart and 9 inches in the row. These will make good plants for forming beds in the spring, which, if not allowed to fruit, will produce fine crops the following year. Continue to plant layers in new beds, and when these have all been removed, trim off, and clear away the runners remaining, together with all litter and weeds, burning it all, to make sure of getting rid of slugs and insects. In trimming, the good leaves should not be cut off, as doing this weakens the plants.

WASPS.—The wet weather has kept wasps in check, and many of the queens succumbed in May; nests, however, are getting abundant, and should be destroyed without delay. The simplest method of dealing with the nest is to put half a pint of petroleum into a bottle; put the neck well down into the entrance to the nest, first taking care to stop other holes, and pour the liquid as well as may be into the nest, when every wasp and maggot will be killed. Where the nests are so situated that it would be unsafe to use petroleum for fear of injuring the roots of trees, &c., gas-tar may be used instead, and the entrance plugged with a sod; and where the nest is higher than the entrance, to make doubly sure, after stopping up the entrance, make a hole with a crowbar directly over the nest, and pour tar into it, stopping up the hole with a piece of turf or a bunch of tow dipped in gas-tar.

THE FRUIT-ROOM.—Take the earliest opportunity of cleaning and putting this place in readiness for the earliest Apples and Pears, limewashing the walls and ceiling, and washing the shelves with soap and water. With the introduction during recent years of so many fine-looking Apples and Pears, the gardener should make an effort to make the fruit-room as interesting as possible to those who may visit it. The shelves may be covered with sheets of stout brown paper, which besides giving a neat appearance prevents currents of air from passing up among the fruits.

GRAFTED TREES.—Remove the spray from the stems and branches of the stocks if the grafts are increasing in size, securing the latter to sticks stuck in the soil, or made fast to the stem, &c. If American-blight be observed when the grafting-clay is removed, make use of petroleum emulsion or Gishurst's Compound Soap.

THE KITCHEN GARDEN.

By Arthur Coombes, *Gardener, Himley Hall, Dudley.*

COLEWORTS.—When the plants are large enough, plant them wherever vacant ground can be found, manuring it, if it be poor. It is a vegetable that will be useful in the late autumn and early winter months.

CELERY.—Manure-water may be applied to the forwardest plants twice a week, and trenches thrown

out for later plantings as fast as land becomes vacant. The majority of gardeners will have finished the planting of Celery; still, a few rows of some late-sown variety, if planted as late as the first week in August, will produce useful heads in the spring, if put into trenches made shallow in order to hasten growth. Some few of this sowing should be planted on a north border, to furnish flavouring produce late in the spring. Earlier plantings will now be forward enough to receive the first earthing-up, which should be of no great depth, gradual moulding being better than doing it at once or twice. Before commencing, the land should, if dry, have a heavy application of clear water, followed with one of liquid manure. Having done this, remove the small leaves that soon decay on being moulded over, as also all visible suckers. Place the mould lightly against the plants, a thin portion of the side of the trench being cut down with the spade to provide the mould for this purpose. If the soil be heavy or lumpy, it will be better first to use the soil from the top of the intervening ridge, care being taken to keep the soil out of the heart of the plants.

TOMATOS.—The points of the leading shoots may now be pinched out if a good set has been obtained; the flowers that set after this date rarely producing ripe fruit. All side-growth should be stopped, and overcrowded and luxuriant foliage reduced in size or cut off, and the supports and ties made secure.

LEEKS.—Continue to earth up those in trenches, affording liquid manure when moisture is needed. Make other plantings in deep holes made with a bar or dibber, just leaving the tips of the leaves above the surface and merely make the roots firm at the bottom, leaving the holes open till the plants have attained a fair size, when they may be filled in with the hoe. We lifted some very fine Leeks grown in this way last spring.

BRUSSEL SPROUTS.—Where early sprouts are desired next year, seed may be sown on a south border, and the seedlings when large enough dibbled out at 4 inches apart on firm ground, to be planted out in the spring. Those remaining in the seed-bed will be useful for filling up blank spaces. The second sowing of cabbage-seed may now be made, and care taken that slugs do not prey upon the seedlings.

HINTS ON CURRENT MATTERS. — The refuse leaves and the remains of crops, if it is not convenient to dig them in directly, should be wheeled to a convenient spot and covered with soil to prevent the escape of ammonia. Effort should also be made to hoe all vacant plots of land, and between the various crops, clearing off all weeds.

THE ORCHID HOUSES.

By W. H. WHITE, *Orchid Grower, Burford, Dorking.*

VENTILATION, SHADING, ETC.—Owing to the sudden changes of bright sunshine and cloud experienced during the past few weeks, those who have the management of Orchids will have found it a very troublesome time, great vigilance having been necessary to keep the temperature of the warm-houses near the normal. Owing to external air being warm generally over the country, little difficulty was found in maintaining a suitable temperature for the cool divisions. On warm, damp evenings, such as we are now getting, it is my practice to open the upper and lower ventilators of the Odontoglossum-house to their full extent, and when the outer air is not less than 61° the doors are also opened; the inside thermometer then registering 63°, and the hygrometer 62°, thus showing 1° below saturation-point. At about 10 P.M. the doors are shut, and the top-lights lowered in accordance with the probabilities of the weather, but for the next few hours the lower ventilators are not closed. Under such treatment, insect pests do not cause much trouble—indeed, much less than when the plants are kept in close moist quarters; moreover, the plants seem to derive benefit from the evening air. There are a few species, such as Odontoglossum grande, O. Schlieperianum, O. Insleayi, and its varieties leopardinum and splendens, now making growth, which should be put at the warmest part of the Odontoglossum-house, and which, if not already repotted or surfaced, should have their needs at once attended to. The charming Miltonia vexillaria is now beginning to grow, and will require repotting. My practice is to annually repot this species, because, owing to the quantity of water needed by the plant whilst growing, the compost becomes exhausted; and the plant losing naturally a number of its older roots every year, these may be cut off, and the specimen supplied with fresh compost. Before the repotting is done, it is advisable that each plant should be closely examined for the small yellow thrips which harbour low down in the young growths, and the most effectual method of destroying these insects is to dip the plants into a safe kind of insecticide, and afterwards into clean tepid soft-water. M. vexillaria being a shallow-rooting plant, requires a shallow layer of compost, its numerous fibrous roots preferring to ramble just over or under the surface, and the pots or pans should be very well drained. The rather large pots or pans made use of should be filled with clean crocks to about three-quarters of their depth; and to render these firm, put a layer of sphagnum-moss over all, and above that the compost, which may consist of sphagnum-moss chiefly, with a small quantity of fibrous peat, and crocks broken quite small. Elevate the plant well above the rim of the pot, as by so doing more rooting surface-space is afforded. At first, and till the new growths begin to root freely, water should be afforded sparingly, a fine-rose watering-can being used for the purpose. As the roots lengthen, and according to the condition of the plants, so should the supply of water be increased. They soon become re-established, and the cool-house will suit them for the present; but when the nights become chilly, they should be removed to the intermediate-house. The distinct varieties, Miltonia v. rubella and M. v. superba, are now in full bloom, and although smaller than the type, they are charming. The flowers M. v. rubella are rose-pink, the lip having a white space in front of the yellow disc, while those of the variety M. v. superba are identical as regards size, and owe their distinctiveness to the rich maroon blotch bordered with pure white of the lip. Both varieties should be kept in the Odontoglossum-house till growth recommences.

STANHOPEAS. — In our Cattleya-house the earliest flowering Stanhopeas are now pushing their spikes, and where a large number of varieties is cultivated, there will be blooms on some of them for several months to come. A few of the most beautiful are S. Wardi, S. insignis, S. Mastersii, S. tigrina, S. florida, S. eburnea, and the new S. Lowii and S. Amesiana, both of which resemble S. eburnea. Stanhopeas should be abundantly supplied with water at this season till the flowers open, and as the latter are fugacious, great care must be taken to avoid wetting them. For the present, keep the plants well shaded in the cooler part of the house; and when growth is complete, and the flowering season over, a cooler temperature and drier atmosphere, as well as more light, will be the proper treatment to afford them. Stanhopeas succeed in shallow teak baskets suspended not far from the roof, and ordinary drainage is not required, because, if crocks be used, the flower-spikes are broken or deformed by contact with them. The proper time for supplying fresh materials is when the plants are starting into growth, and the compost should consist chiefly of sphagnum moss and fibrous peat, the last in the smaller proportion.

FRUITS UNDER GLASS.

By BAILEY WADDS, *Gardener, Birdsall Gardens, York.*

MELONS.—The plants that will furnish ripe fruits late in the season should be encouraged to set their fruits as early as possible after this date, and make rapid progress afterwards. In order to secure a good set, the flowers and foliage should be kept dry for a few days, the air of the pit or house being maintained in a moist state by sprinkling the floors, &c. Red-spider is apt to give trouble at this season, also thrips, and means should be taken to keep them in check. When the fruits are swelling, afford the plants liquid-manure in a much diluted form, and when the fruits begin to ripen, damp the plants frequently, but withhold water from the roots as much as may be consistent with a growing condition. The temperature of the house or pit should be kept at about 70° by night, 80° by day, affording sufficient air to keep the foliage robust and firm, and some small amount may be left on at night. When the fruits begin to have a perfume, and the rind to crack away from the stalk, cut and place them in the fruit-room or other cool place for future use. Melons keep a week or longer at this season.

PEACH AND NECTARINE-HOUSE.—Early-forced trees will now be casting their leaves, and any re-planting or formation of new borders that may be required should be taken in hand forthwith. Young trees that are growing too strongly may now be carefully lifted and re-planted. In making borders, use a strong rich pasture-loam, that has been cut and stacked for not much less than one year. It should be chopped up thoroughly, mixing it in the following proportion with other substances, viz., 1 cart-load of lime-rubbish, 1 cwt. of ½-inch bones, 1 cwt. of bone-meal, to eight cartloads of loam; farmyard-manure not being used, as it shrinks much in bulk, causing the borders to settle very soon after making, and often damaging the trees, besides inducing sappy, gross shoots. Late-forced Peaches and Nectarines should have their borders well watered, and the foliage syringed daily, aphis being destroyed by frequent applications of quassia-water. Air should be abundantly given to secure well-ripened wood. Advantage should be taken of spare days in the autumn to lay in a stock of various kinds of loam suitable for fruit trees, Vines, &c.

FIG TREES.—Those planted in borders may need, if fruiting heavily and not growing strongly, manure-water at the roots. The foliage should be syringed twice daily, especially the underside of it, where red-spider mostly harbours. When the drainage of a Fig-border is in good order, there is little fear of harm being done by copious waterings at this season; still, discretion is necessary, as no tree suffers more quickly from bad drainage than the Fig.

ORCHARD-HOUSE.—Pear, Plum, and Peach trees in pots, as the crops are gathered from them should receive an abundant watering at the root, and be freed from aphis and other insects; and as the wood gets ripened, they should be turned out into some place out-of-doors that is sheltered on the north side of it.

TOMATOS.—Plant out in beds, or pot into 10-inch pots those intended for winter fruiting. Prelude and Trophy are good varieties for winter fruiting. Another batch of cuttings may be put in, so as to make sure of a continuous supply of fruits up to the new year. Attend well to the wants of those plants that are bearing heavy crops of fruit, applying some kind of artificial manure once a week, and laying-in the leading shoots without stopping them, but removing the laterals, or stopping them at the first leaf above a truss of flowers, a method that some growers adopt with good results. The fruits may be taken as soon as coloured, if required to be kept for any length of time.

THE FLOWER GARDEN.

By JOHN LAMBERT, *Gardener, Powis Castle, Welshpool.*

THE FLOWER-BEDS.—The beds will now require almost daily attention, to free them from weeds and preserve a proper outline. Calceolarias, especially the weaker-growing varieties, should be kept in proper position by means of small twigs stuck amongst them. Tall-growing varieties, like C. amplexicaulis, will require thin sticks, to which the stems must be tied, or they may be pegged down to the soil. The rainy weather has made the growth of Calceolarias strong and lanky, hence the need of supports. The trailing species of bedding plants should be carefully pegged down to the soil, and where carpet-bedding is practised, there will be numerous little details to carry out in maintaining good order. All such plants as Pyrethrum, Alternanthera, Coleus, Mesembryanthemum, will require pinching sufficiently severe to ensure that the lines of the designs may be clearly seen. Owing to the wet weather we have had, Pyrethrum Golden Feather, though scarcely so good in colour as might be wished, has hardly shown any flowers. Mesembryanthemum and Alternanthera are now in need of warm sunshine seeing that the plants are established, to bring out the brilliancy of their tints. Dahlias should be securely staked and tied, and if fine blooms are required, the flower-buds should be thinned, the best-formed ones being retained. The plants must not lack water, and occasionally manure-water may be afforded.

AURICULAS AND POLYANTHUSES.—Seedlings of these raised from sowings made last autumn or in early spring, should be transplanted from the seed-beds, choosing for them a spot not exposed to the midday sun, planting them in rows 4 to 5 inches apart, and 3 inches in the rows. Afford water when transplanted, and afterwards in dry times.

HERBACEOUS BORDERS.—Make notes of any species which by reason of great usefulness as cut-blooms or other good properties it is desirable to increase the stock of; and what improvements are desirable in the arrangement of the plants at transplanting time. Continue to secure all tall-growing subjects to stakes.

EDITORIAL NOTICES.

Advertisements should be sent to the PUBLISHER.

Letters for Publication. — *All communications intended for publication, as well as specimens and plants for naming, should be addressed to the* **Editor, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.*

Plants, Fruits, &c., to be Named.—*Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be good ones, carefully packed and numbered, and not more than six should be sent at one time. Leaves only, or Florists' varieties cannot, as a rule, be named.*

Illustrations.—*The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.*

Newspapers.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.*

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

WEDNESDAY, Aug 8—East Anglian Club.

SHOWS.

MONDAY, Aug. 6 — Beddington, Carshalton, and Wallington, Mansfield, Northampton (two days), Wells, and Saffron Walden Horticultural Societies.

TUESDAY, Aug. 7 — Leicester Horticultural Show and Gala

THURSDAY, Aug. 9 — Welshpool (two days), and Taunton Horticultural Societies.

SALES.

THURSDAY, Aug. 9 — Unreserved Sale of Exhibition and Decorative Plants, Orchids, &c., by order of Mrs. Lawes Crawshay, at Bradbourne Hall, Sevenoaks, by Protheroe & Morris.

FRIDAY, Aug. 10 — Orchids, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—62°.9.

Grapes Going off.

This is the heading to a notice at p. 767 of the last volume of the *Gardeners' Chronicle*, and is in answer to some querist about the failure of the blossoms to set. As one travels through the country, it is not uncommon to hear the remark amongst Grape growers that certain varieties do not set well; and, as a matter of course, if Grape-vines are left to themselves, some varieties will set badly, not altogether because the borders are not in good condition, or even that the temperature of the house or the atmospheric conditions are wrong, but because of certain characteristics in the variety. When the Royal Vineyard, a good late-keeping white Grape, was sent out, we had a plant of it; but we found, as others also found, that it was one that did not set well. Complaint was made about this through the *Gardeners' Chronicle*, and the raiser replied that it was owing to a small globule of water upon the stigmatic part of the flower, which prevented the pollen from touching it. We examined the blossoms, and found that this was so, and on drawing a bunch through the hand, the water was removed. We have had no trouble with this fine Grape since, as in the process of removing the moisture from the flower, the pollen is dusted on to the stigma, and fertilisation takes place. Drawing the bunches lightly through the hand does no harm to the incipient berries. Mrs. Pince's Black Muscat and Lady Downes' Seedling require different treatment when they are in flower to get the berries of an even size all over the bunches. Mrs. Pince is the more fickle of the two, perhaps; but the berries will be of even size if a rabbit's-tail is tied to a long stick, and gently drawn down the bunches of Black Hamburgh or Alicante, and afterwards brought down the Mrs. Pince in the same way. The pollen of the one is more potent than that of the other. We do the same with Lady Downes. This is carried out daily when the Vines are in flower; at the same time the night temperature of the house is 70°, with a proportionate rise by day, and at the time the Vines are in blossom, the moisture in the atmosphere should be considerably less. At one time Vine-growers were not satisfied with the moisture that might be derived from sprinkling the borders, paths, and walls of the house two or three times in a day; but besides this, a constant steam was kept up from water-troughs fixed to the hotwater-pipes. We now think that over-moisture is a condition which, in the aggregate, does more harm than good. Many good growers have discontinued the practice of evaporation from the hotwater-pipes, and, perhaps, rightly. Besides "bad setting," Grape-growers know something of "rust." How is it caused? and how may it be prevented? are two questions of some importance; and if we can answer the first, it is possible that this will go towards solving the second. The rusty appearance upon the skin of Muscat Grapes is caused by sulphuring the pipes, and heating them well to kill red-spider; the sulphur will do no harm if it is not applied until the berries have reached the stoning period. Gardeners will have observed that after the Grapes have grown to a certain size, they do not grow appreciably larger for about six weeks. The seeds are growing inside the berry, and when this is taking place, sulphur will not injure the skin of the berry. We have settled this point by experiment. We have produced the rust by sulphuring the pipes soon after the berries were thinned. We have gone through the same process later, and the berries have not been injured in the least. The Black Hamburgh Grape is sometimes injured by a different kind of rust, which causes the skin of the berries to contract, and the berries themselves to crack. We have frequently heard gardeners say that contact with the hair of the head when thinning out the berries is the cause, but we should not think any gardener would be so careless as to allow his hair to come in contact with the berries at that time. Good cultivators are used to do all their Grape-thinning before breakfast in the morning, when the houses are at their coolest point, and rust was never seen on the berries; but sometimes, the thinning has to be done in the day, and during sunshine it gets very hot, and to make things pleasant, all the ventilators and even the doors are thrown open. If, at the same time, a keen east wind is blowing, it has a disastrous effect upon the tender skin of the berries, which have not been formed more than ten or twelve days. Great care should be taken in ventilating the vineries, especially early in the season, when the east winds are blowing, and up to the time the stoning commences; after that time the skin of the berries is not so liable to injury.

Too much moisture in the atmosphere also causes air roots to form, and produces the warty appearance on the under sides of the leaves which is so undesirable in a house of good Grapes. It must impede the functions of the leaves, transpiration cannot go on freely, nor the equally important functions of assimilation and respiration; and when a gardener says this, that, or the other does not matter, he has evidently not become acquainted with the elementary principles of his work. We have no hesitation in saying that Vine leaves, when they are covered on the under surface with a conglomeration of green warts, are not in a condition to produce first-class Grapes, particularly when, as is often the case, the warts are the residence of Vine mites. The adventitious roots alluded to above are not produced when the Vine-plant is in a healthy condition. The roots of a Vine are naturally produced underground, and if they are in a condition to supply the Vine with a sufficiency of plant-food from the soil, the emission of roots from the base of the young growths would not take place. The borders may be too cold, as they often are when early forcing is carried on, and the over-moist atmosphere aids the production of these roots, which were caused in the first place by the want of reciprocity between the action of the roots and the leaves.

We have frequently had both leaves and berries sent to us covered with mildew, when the parasite has been left too long for a cure to be effected without entirely spoiling the crop of fruit. Sulphur upon the hot-water pipes will destroy mildew, but here it is again that good cultivation comes in as a deterrent, and prevents its appearance. Although the Vine is liable to be attacked by mildew, the parasite does not take so kindly to it as it does to the Rose. Some gardeners are constantly forcing Roses in their vineries under the Vines, and expect mildew to attack them as regularly as the Rose blooms appear, but knowing the conditions under which it attacks Vines, we have no fear of it. The writer's vineries have been planted for twelve years, and in all that period he has not seen a trace of mildew on leaf or berry, and every year have the pot Roses been attacked with mildew underneath them. A great authority on the Vine says: "The spores of mildew may exist in myriads on every inch of the Vine's surface and do it no harm, unless the climate of the vinery is made to suit their development, when they spring into life as if by magic, and arrest the growth of all they attack." This is exactly our experience. Keep up a regular temperature and suitable atmosphere, and the Vines will be safe.

LILIUM MONADELPHUM.—The illustration (fig. 19) shows one of the commonest, but at the same time one of the most striking, of hardy Lilies. The following extract from Mr. Elwes' splendid *Monograph of the Genus Lilium*, sub tab. 21, gives all the details that are necessary for our present purpose:—"The Caucasian Lily is one of those which must be considered indispensable to every garden, great or small. Its hardy constitution, sweet scent, and early-flowering habit, are all points which tell greatly in its favour. It appears to be exceedingly abundant in many parts of the Caucasus. Mr. Freshfield, in his charming book of travels, speaks of it as growing in the valleys amongst a rank growth of herbaceous plants, at an elevation of 4000 to 6000 feet. In England it certainly likes a strong soil, and when well-established, grows to a height of 3 to 5 feet. It is one of the earliest in flower, and ripens seed freely in most seasons. The scent, though unpleasant to some persons, and too strong to make it desirable as a pot plant, is to me agreeable, though less so than that of L. auratum and other Lilies. The seed, if sown at once, germinates very quickly, but, as was first pointed out by Professor Duchartre, does not show its cotyledon above ground. The seedlings grow very slowly, and, as I am informed by Mr. Ellacombe, sometimes do not flower till the tenth year after sowing. This is a trial of patience too much for most amateurs, though the bulb growers of Holland, more accustomed to

such operations, have lately raised large quantities from seed. Though introduced by Messrs. Loddiges early in this century, it has not become common until the last few years, when it has been imported from its native country in large quantities. Being a very variable species, it has been described and figured under several different names by various authors; and though the varieties are fairly distinct, yet they run into each other so closely, that I think best to follow the high authority of Mr. Baker in considering them as varieties only. The plant was first described by the Russian botanist, Marschall Von Bieberstein, having been found in the Caucasus when those mountains were first explored by Russian naturalists. By Ledebour it was considered to be the same as L. pyrenaicum, and though that opinion may seem ridiculous when a fine and well-grown plant is examined, yet one of the varieties, which Mr. Baker has distinguished as var. Ledebouri, is but little different from the Pyrenean plant. The monadelphous character of the stamens does not appear to me to be a constant or reliable character. It varies very much in different plants, some having the filaments united for at least one-third of their length, and others only at the base or (as is more common in the variety called Szovitsianum) not at all."

Fig. 19.—Lilium monadelphum: flowers creamy-yellow.

Royal Horticultural Society.—The new bye-law which was adopted at a special general meeting of fellows held on July 24, 1894, runs as follows:—Bye-law 11a. Any Fellow wishing to commute his annual subscription may do so by making one payment of forty guineas in lieu of a £4 4*s.* annual subscription; of twenty-five guineas in lieu of a £2 2*s.* annual subscription; or of fifteen guineas in lieu of a £1 1*s.* annual subscription; such commutation entitling the Fellow for life to all the privileges of the corresponding annual subscription. To this the following rider was added:—That it be an instruction to the Treasurer of the Society that all monies paid as commutations of annual subscriptions be invested, and the interest only of such monies be dealt with as part of the annual revenue of the Society.

"Kew Bulletin."—The June issue of the Bulletin of Miscellaneous Information from the Royal Gardens, Kew, contains, as usual, several important papers devoted to the following subjects: "Treatment of Diseased Sugar-canes in the West Indies," "The Citron in Commerce," "New Orchids, Decade 9," "Cold Storage of Fruit," "Sisal Hemp at the Bahamas, and Gambia Pagne, or Native Cloths." Last, but not least, are the "Miscellaneous Notes," which are interesting to general as well as to scientific or technical readers.

Torquay District Gardeners' Association.—The members of the above held their second annual summer outing on Monday, July 30, being favoured with delightful summer weather, the party numbering over 100 persons. After proceeding to Plymouth by special train, a steamer commenced the 20-mile trip up the River Tamar to Calstock, where luncheon was served. Pentillie Castle, the residence of Mr. W. Coryton, J.P., was visited on the return journey, and, accompanied by Mr. C. W. Cove, the head gardener, the party spent an hour in inspecting the fine gardens. The Ghent and Indian Azaleas, recently in full bloom, Lapagerias, Camellias, and other comparatively tender plants, were here in immense size in the open, one grand specimen of Ghent Azalea measuring 27 yards in circumference. Rhododendrons, Magnolias, and Kalmias are thriving luxuriantly, whilst the peeps of wood and river to be obtained from the terrace were very delightful. H.M.S. Defiance, torpedo training school, was the next halting-place, and here an impromptu lecture was given, and experiments were performed, for the benefit of the party. Torquay was reached soon after 10 p.m., a most enjoyable day having been spent.

Severe Storm.—A thunderstorm of unprecedented severity and duration, writes Mr. Jenkins, of Hampton, burst over this portion of West Middlesex about noon on Sunday last, and continued raging with unabated fury for nearly two hours. Scores of greenhouses, to say nothing of pits and frames, were, for the time being, flooded, the water pouring through the paths of the former like a torrent. Stokeholes were speedily flooded, and fires put out, in numerous instances causing considerable anxiety for the safety of boilers. So far, happily no instance of bursting has been noted. Plants out-of-doors, such as Chrysanthemums on the standing ground, had the soil washed from under them, and were toppled over; other plants were standing in 1 foot or more of water. Such a storm has not been witnessed by the oldest inhabitant.

Beddington, Carshalton, and Wallington Horticultural Society.—In connection with the annual show of the above Society on August 6, the Surrey County Council (Technical Education Committee) have made arrangements for holding an exhibition of produce from their Continuation Schools Allotments. Three feet of table-space will be allotted to each school, and the exhibitors will fill up a form stating the conditions under which the produce has been grown, nature of soil, subsoil, &c. Entries are to hand from Aldershot, Caterham, Upper Caterham, Chart, Farnham, Weybridge, Hersham, Banstead, Fetcham, and Leatherhead.

Plants under Coloured Glass.—M. Villon has just brought to a conclusion an interesting series of experiments on the culture of plants under coloured glass. M. Villon potted his plants in cases in which panes of glass could be easily replaced by others of a different shade. The following panes of glass were used:—

(1). Glass made orange coloured by a coating of bichromate of potash, allowing only the yellow and red to pass.

(2). Violet glass coloured with manganese which absorbs the yellow and blue rays of the spectrum.

(3). Blue glass coloured with cobalt, allowing only the red and ultra violet rays to pass.

(4). Blue glass coloured with copper, allowing only the ultra violet rays to pass and absorbing the extreme red rays.

(5). Glass covered with thin layer of silver, allowing only the blue rays to pass.

(6). Uranium glass, absorbing the light to a great extent.

(7). Gilded glass.

(8). Red glass coloured with protoxide of copper, absorbing all colours of the spectrum between red and blue.

(9). Green glass coloured with protoxide of iron, absorbing the red rays.

M. Villon, taking the growth of plants under white glass to be 100, obtained the following results:—

(1).	Culture under	bichromated orange glass	150
(2).	,, ,,	manganese violet glass	150
(3).	,, ,,	cobalt blue glass	140
(4).	,, ,,	copper blue glass	120
(5).	,, ,,	silvered glass	60
(6).	,, ,,	uranium glass	40
(7).	,, ,,	gilded glass	40
(8).	,, ,,	red (protoxide of copper)	15
(9).	,, ,,	green (protoxide of iron)	10

These experiments seem to show that the light that favours vegetation most is the orange light of the chromic glass and the violet light of the manganic, and as the radiations that these glasses allow to pass are the red and violet, these rays are the ones that seem to be most favourable to the development of plants. But the growth under no glass at all, wherever possible, is decidedly best of all.

Tadcaster Middle-class Girls' School Horticultural Show.—On Friday, July 20, the first attempt was made by the children of the above school to hold a flower show in the schoolroom, under the superintendence of Miss Earl, the head mistress, when prizes were awarded for the best exhibits. The following is a list of classes:—(*a*). Gardens. (*b*). Decorated fireplaces. Class 1, wild flowers in bunch; 2, wild flowers in basket; 3, garden flowers in bunch; 4, flowers in vases; 5, buttonholes; 6, table decorations; 7, grasses in bunch; 8, plants in pots; 9, fresh specimens of flowers on sheet (named). The show was a great success, and highly creditable, the children displaying much good taste in their arrangements. It is a step in the right direction, and it deserves all the support and patronage it can get.

Early Experiments in Heating.—In one of Sir Hans Sloane's letters to Ray, 1684, mention is made of the mode of heating adopted by Mr. Watts, the curator of the Chelsea Botanic Garden. As the passage is not generally known, it is here transcribed: "Mr. Watts having a new contrivance (at least in this countey), viz.: he makes under the Floor of his Greenhouse, a great Fire Place, with Grate, Ash-hole, &c., and conveys the Warmth through the whole House by Tunnels; so that he hopes by the Help of Weather Glasses within to bring, or keep the Air at what degree of Warmth he pleases, letting in upon occasion the outward air by the Windows. He thinks to make by this Means an artificial Spring, Summer, Winter, &c." In 1685 Evelyn visited the garden, and thus speaks of this system of heating in his diary: What was very ingenious was the subterraneous heat conveyed by a stove under the conservatory, all vaulted with brick, so as he has the doores and windowes open in the hardest frosts, excluding only the snow."

A Tell-tale Cattleya.—M. Lucien Linden obligingly forwards us a flower of a Cattleya in which there are two lips and three stamens; one external median, the others internal and lateral (a1, *a*2, *a*3). From the arrangement of the parts, it would seem as though the true lip was wanting, the two lip-like structures being probably the representatives of the two outer lateral stamens (a2, a3).

Annual Excursion.—The *employés* of Messrs. Wm. Fell & Co., The Royal Nurseries, Hexham, were treated to their annual holiday and excursion. A large company left by special train to Edinburgh on Saturday last, July 28. Queens weather prevailed, and everyone enjoyed the outing. The assistants in the seed warehouses and the staff in general offices elected to go to Windermere. The firm treated them in the same way.

Government Entomologist, U.S.A.—Mr. N. O. Howard, of New York, a graduate of Cornell, has (we cite from *Garden and Forest*) been appointed Entomologist of the Department of Agriculture to fill the position made vacant by the retirement of Dr. C. V. Riley. Since 1886, Mr. Howard has been the first assistant to the entomologist of the department, and is the author of numerous memoirs published by the department, and joint-editor of *Insect Life*, the periodical issued by the Division of Entomology. The position of first-assistant, created by Mr. Howard's promotion, has been filled by the appointment of Mr. C. L. Marlatt of Kansas.

Horticulture in the United States.—We have received a pamphlet on the Progress of Horticulture in the United States. The information given is reprinted from articles originally furnished by Mr. Alfred Outram to the *Gardening World*, and forms a most satisfactory record of progress and enterprise. California, Florida, and Colorado are named as being among the principal fruit-growing districts; New York as having an influential horticultural society; and it is further said that there and elsewhere are many establishments devoted to the raising and exporting of various kinds of vegetable produce in prodigious quantities to supply an ever-increasing demand. For details of these industries we must refer our readers to the pamphlet itself.

Experimental Tea-culture in Russia.—In a report on the Tea trade of Hankow, it is stated that an experiment in the cultivation of Tea in Russia, which has been before tried without success, has recently been repeated, Tea plants having been sent from China to be planted on the slopes of the Caucasus. It is a private enterprise, but the ground has been granted by the government. About 2,000 plants have been sent at great expense, and in obtaining them there was a certain amount of difficulty, the people in some districts destroying the plants on their way down to Hankow. Though the plants are said to have arrived in Russia in excellent condition, the experiment is not considered likely to prove more successful than the former one.

"Le Livre des Orchidées."—It is only a very short time since we had occasion to note the appearance and completion of three standard books on Orchids, and now comes a fourth from the pen of our accomplished friend, Count Oswald de Kerchove, the well-known President of the Royal Agricultural and Botanical Society of Ghent. The book is richly illustrated, excellently written, and indispensable to those who wish to know something about the plants they admire. The publisher is M. Ad. Hoste, Rue des Champs, 47, Ghent. We shall shortly give a longer notice of this important volume.

Orchid Notes and Gleanings.

Orchids at Hazelbourne, Dorking.

Most beginners in Orchid culture acquire proficiency rapidly in some branch or other of this interesting pursuit. The most noticeable of such successes

are generally those in which accident, or the possession of a specially suitable house for a particular class of Orchid, has shown what things can be grown well in the convenience at the disposal of the cultivator who has been clever enough to pursue the culture of the class thus indicated instead of wasting his time on others which might have proved failures. In the pretty gardens of Welbore S. Ellis, Esq., the culture of Odontoglossum crispum is carried out in the most satisfactory manner, the several specially-constructed houses there being filled with plants in the finest possible condition, and which have in their season produced a fine show of flowers of the very best type, some of the spotted forms being very distinct and handsome. The whole of the plants in the houses were imported during the last few years, and yet in consequence of the admirable manner in which they are grown, they bear no evidence of that fact, but are plump, having the look of old-established plants. Some few are still in bloom, and show the good qualities of the strain. Mr. Masterton, the gardener at Hazelbourne, has obtained good results, shown on these, and, indeed, from all the Orchids he has under his charge at Hazelbourne.

In the warm Orchid-house adjoining the conservatory, and where a good supply of Orchids in bloom is always kept, are some well-bloomed specimens of Cattleya Warscewiczii, C. Mendelii, a very fine C. Rex, C. Gaskelliana, Oncidium Kramerianum, Cœlogyne Massangeana, Phalænopsis Esmeralda, Tricopilia crispa, Oncidium leucochilum, Cycnoches viride, Mormodes pardinum unicolor, &c.

In another house the specimens of Dendrobium Falconeri are thriving unusually well; in the new range the Dendrobiums generally are in fine condition; in one of the intermediate-houses the many plants of Oncidium ornithorrhynchum and O. incurvum are sending forth an extraordinary number of flowers, and in the other houses most things are good, even the Bolleas and Pescatoreas, of which there are a few, being in a very healthy condition.

NOTICES OF BOOKS.

LANDSCAPE GARDENING IN JAPAN. By Josiah Conder, &c.; with numerous illustrations.

SUPPLEMENT TO LANDSCAPE GARDENING IN JAPAN. By Josiah Conder; plates by K. Owaga. (London: Sampson, Low, Marston & Co.)

A SENTENCE or two from the preface describes the aim and scope of these works. They contain "an exposition of the rules and theories of the Art of Landscape Gardening in Japan, as followed from ancient to modern times, so far as they can be gathered from a thorough study of native authorities, added to personal observation of the best remaining examples. . . . . The writer's task is partly accomplished if he succeeds in showing that beneath the quaint and unfamiliar aspect of these Eastern compositions there lie universally-accepted art truths. . . . . Robbed of its local garb and mannerisms, the Japanese method reveals æsthetic principles applicable to the gardens of any country, teaching, as it does, how to convert into a poem or picture a composition which, with all its variety of detail, otherwise lacks unity and intent."

Our readers are in a position to appreciate much of what Mr. Conder tells them, as we have from time to time given illustrations of Japanese gardens. Indeed, many of the views given in the Supplement to this volume have appeared also in our columns, often accompanied by descriptions from the pens of those who have been so fortunate as to see the originals. A great deal of what seems to us quaint bizarre, and out-of-place in a garden conveys no such ideas to the Japanese mind. The carefully-laid stones, the artificial lanterns, the clipped trees, the shams, as we should call them, which disturb the sense of quiet and ease which we so covet in a garden, and which so sadly destroy the idea of space and breadth that we seek to obtain, all these have distinct significance and religious meaning to the native mind. Remove them, and you would destroy all the sentiment and association which makes gardens precious to them. Human Nature is pretty much alike, whether on the shores of the China sea or the borders of the British Channel, and which of us fond of his garden, has not some, as it were, sacred spot in it. It may be, very likely is, foreign to the canons of Art, or it may be something which excites the irony of the "superior person," who, having partial knowledge dogmatises, where others with fuller knowledge and deeper sympathy treat with respect, if not with full acquiescence. Remembering this, Mr. Conder's statement as to the meaning and significance of what we in our ignorance might deem monstrous excrescences, enable us to look on Japanese gardening in a truer light. But though there is much that seems to us artificial and distasteful in Japanese gardens, there is much in them that is natural, suggestive, and beautiful, to a very high degree. The Japanese have a love for and appreciation of Nature, that many of us might well envy. The plates in the supplement show how, in the management of water, the grouping of shrubs and trees, the undulations of the surface, the Japanese landscape gardeners have nothing to learn from us; whilst we, on the other hand, might sometimes greatly profit by a careful study of their procedures. Remove some of the artificialities which to us have no significance, and the Japanese garden, as shown in the supplement, provides an excellent model, not, indeed, for exact reproduction, but for adaptation to our conditions. It seems to us that in the designing of small gardens especially, the Japanese are, as a rule, superior to ourselves. Innumerable villa gardens round our towns which are now either monotonous iterations, or simply ugly spaces, would, in Japanese hands, be transformed, so that each would be individualised, and have a beauty of its own, and this would be done not by any foolish attempt at transcript of any particular natural scene, but by following out, so far as circumstances permit, the same principles of disposition and grouping as are manifest in Nature.

Mr. Conder, in a well-written and interesting introduction, shows us the principles upon which the Japanese landscape gardener acts. The limitations of our space forbid us from making extracts, but we may commend Mr. Conder's statements to the thoughtful consideration of our designers. The Japanese owe their first lessons to the Chinese, whose methods were introduced so long ago as the six century. Modifications occurred in succeeding centuries which are traced in detail, and examples of the various styles are carefully described by Mr. Conder down to the present period. The chapter on garden stones is very curious, and helps us materially to understand the great care paid to their form and arrangement by the Japanese. The stone-lanterns are, it appears, exclusively of Japanese origin. To our idea, though often individually well designed, they are used in excess, but here again we must take into consideration the sentiment of the people. They might, with propriety be introduced into public gardens where evening entertainments are given. Numerous drawings of these lanterns, and of pagodas, and other garden buildings, are given in the volume before us.

The sections on the construction of garden-fences, gates, bridges, summer-houses, we may also commend to the notice of our garden designers, who will find in them much to profit by. The treatment of water-scenes, again, is one which deserves the most attentive consideration at our hands. The boundaries are partially concealed, so that its extent may be undefined and suggestive. There must be some reason apparent for the existence of the water, some suggestion as to where the water comes from, and where it is going.

Mr. Conder devotes considerable space to the trees and shrubs of Japan, but as these are now mostly well-known here, there is the less necessity for us to refer to them further than to say that the Japanese themselves rely chiefly, if not exclusively, on native vegetation for their landscape effects, and that they are careful to place the trees in appropriate positions. A tree, for instance, which naturally grows on a mountain side is always placed on an eminence, and not on a flat surface near water—a fact which shows what careful observers these Japanese gardeners are.

The chapter on garden composition is admirable, the methods followed by the landscape-gardener being shown to be those adopted by the landscape-painters of the West in obtaining materials and in designing their compositions. Making the necessary allowances for the differences of circumstances, the plan followed by these gardener-architects of the East might be followed much more frequently than it is by their brethren of the West.

"Seeking inspiration from those natural sources which for countless generations have formed the theme of the poet and the motive of the painter, and around which time has cast a halo of romance, surely it is no idle boast to claim that he can adapt his beautiful art to the highest or lowliest station in life, or frame it in sympathy with whatever sentiment may stir the human soul."

With this sentence the work closes, and fitly enough it leaves on the mind the remembrance of what is the whole aim and purport of the book. Among the many works on modern landscape gardening, there is not one more suggestive and helpful than this. Let its teachings be but guided by the principles of adaptation and necessary modification, and the result can hardly fail to be excellent.

A HANDBOOK TO THE STUDY OF NATURAL HISTORY, FOR THE USE OF BEGINNERS. With an introduction by Sir Mountstuart E. Grant Duff, G.C.S.I., F.R.S. Edited by the Lady Isabel Margesson. (George Philip & Son, London.)

THIS book is the work of many hands, the chapters on zoology, birds, shells, the study of flowers, the study of mosses, fungi, seaweeds, &c., being each by a different author. The volume is intended as much for parents and teachers as for pupils, since it tells how knowledge should be imparted, and does not itself profess to teach in detail.

The main object which the writers have in view is a laudable one. They would encourage a love of natural history in everyone, and have lessons given in field, moor, and on the sea-shore, rather than from text-books only. An ounce of observation is worth a pound of "cramming," both in present interest and future value. Throughout the pages it is insisted that life is not to be destroyed, nor even captivity to be inflicted on any sentient creature for one instant longer than is necessary for due study of it. In "How to Observe without Destroying," Miss Carrington tells us that "water creatures may be retained without a trace of cruelty for a short time," and adds that they may be fed with small larvæ. Are we to suppose that the lives of these latter are of less value, and form an exception to the general rule?

Mrs. Brightwen, in the appendix, speaks of the destruction of the coco-de-mer or double Cocoa-nut trees. She may like to hear that steps were taken some years since to check this wholesale devastation of a valuable species.

On the whole, this handbook of natural history is not uninteresting, and should prove of considerable value for the purposes for which it is intended. We cannot all be Linnæuses, Darwins, or Hookers; but we can all remember the old tale of "eyes and no eyes," and cultivate an interest in, and appreciation of, the natural objects which are to be found in even the (so-called) dullest neighbourhood.

THE PROMISE OF THE SEED HARVEST.

THE condition of the seed crops in the counties of Essex, Cambridgeshire, and Lincolnshire is just now causing a great deal of uneasiness to seed-growers and farmers. Hot drying weather is greatly needed and ardently wished for, but instead thereof there comes drenching heavy rains, high winds, and severe thunderstorms.

Peas.—In many parts the corn crops are much beaten down, and in the Pea-growing districts weeds have grown freely in spite of all efforts to keep them under, and there is great danger of many of the earlier-formed pods rotting completely. Earlier in the season the Pea crops were most promising, but the conditions some time since changed for the worst; and, as above stated, the growth of weeds has choked the main crop and late varieties, and considerable concern is being shown on the part of growers. All the varieties, early and late, have made a free growth, and this adds to the danger to be feared from rot. There can be no doubt but that early frosts chilled and impaired the constitution of the plants, and prevented fructification; and during the cold rains and cold winds of June, the blossoms fell off, leaving no embryo pods behind, or if they did, curled and abortive seed-vessels followed.

Broad Beans.—The crops of these suffered from the same conditions as those which affected the Peas, though in Kent and Essex the promise is, on the whole, good. In the Midlands the weather was very hot and dry at the time of flowering, and the blossoms did not set well, and there is scarcely a Bean-pod on some of the stems. Happily, there has been a singular absence of the "smother-fly." There will be a better crop than last year, but under the most favourable circumstances it will not be so good as it at one time promised to be; a showery time invariably brings a vigorous growth, but a scarcity of Beans.

Runner and Dwarf Beans.—In Lincolnshire, the crops of these look remarkably well, but the growth was late, and the recent moist weather caused growth of bine rather than the formation of pods; and as these will be produced late, they will be fleshy, and take a good deal of time in ripening. This is true of the dwarf-growing as well as of the runner types, and only the choicest sorts of these are planted in Lincolnshire.

Mangold Wurzel.—Owing to the scanty harvest of last year, and a corresponding diminution of stocks, largerbreadths of Mangolds than usual were put out in Lincolnshire, and so far they look clean and bright, with the promise of a heavy yield; but fine weather—airy and bright—is badly needed to ripen the crops.

Turnips and Swedes.—Stocks of these had become low owing to the scarcity of last season, and unusually large breadths of plants were put out for seeds, both by farmers and growers, on contract. The drought of the autumn killed many plants, and the mild winter caused what remained to blossom earlier than usual; but the cold chilling weather of May and June affected the bloom, and the absence of sun-heat led to an attack of blight, and the effect can be seen in many abortive seed-pods, and instead of 30 bushels per acre, there will be 20 bushels and probably less; samples already coming in are what are termed foxey. White Turnips promise to be a better crop than Swedes; they are affected with blight, but not so much in the South as in the Midlands.

Cabbages, Broccoli, &c.—All the crops of Brassicas are full of insect-life, and grow badly; it is expected the yield of Cabbage seed will be small. Broccolis bloom later, but the crop cannot be a heavy one; and the promise of the seed-yield of Savoys, Kales, and Brussels Sprouts is by no means reassuring.

Mustard.—Large breadths of Mustard are to be seen in Lincolnshire, both brown and white at present; the ripening seed-pods look plump and bright, but fine weather is needed. Carrots are promising well; some breadths of selected Altrincham and St. Valery Intermediate being grown by Messrs. W. W. Johnson & Son promise exceedingly well, being in full bloom. Carrot seeds are sown in July and August, the roots are pitted, and all selected ones planted in the spring to produce seed.

Rape.—Rape promises well; the seeds are sown in late summer and autumn; seeds saved from a maiden crop are preferred, though some feed off before the plants are allowed to seed.

Potatos.—The Potato crop has made a vigorous growth, and in the Potato-growing district of Kirton, near Boston, where Myatt's Ashleaf is largely grown for market, the crop is being dug while the haulm is quite green—the result of a second growth, the first having been cut down by frost. In breadths of main crop varieties there are symptoms of disease, and the Bordeaux Mixture is being applied. The early types of Potatos, which are mostly grown in Lincolnshire, are turning out light, owing to the spring frosts.

Parsley.—The principal variety grown in Lincolnshire is the Ever Green Moss Curled, and that at the present time is most promising.

Cress. — Cress is grown for seed mainly in Cambridgeshire, though some breadths are to be seen in Lincolnshire, both curled and plain, and both are looking well.

Radish.—The crops of this salad-plant are also quite promising.

Onion.—The culture of the Onion for seed is almost entirely confined to Bedfordshire, and very few breadths appear to be grown this season for this purpose.

Parsnip. — This popular vegetable is being sparingly grown for seed this season, owing to the difficulty of procuring stock to plant for the purpose. The popular Parsnip in this district is Sutton's Magnum Bonum, which may be appropriately described as an improved Student. *Pisum.*

MR. ALEXANDER KIRK.

We are enabled, through the courtesy of the Editor of the *Scotsman*, to give a portrait of Mr. Alexander Kirk, gardener to Mr. John Thomson

MR. ALEXANDER KIRK,
WINNER OF THE NEILL PRIZE IN HORTICULTURE.
(See also *Gardeners' Chronicle* July 21, p. 74.)

Paton, Norwood, Alloa, who was lately awarded by the Council of the Royal Caledonian Horticultural Society the Neill prize in horticulture, given every second year to "a distinguished Scottish botanist or cultivator." Mr. Kirk, who is a native of Newton-Stewart, served his apprenticeship as a gardener at Cumloden, in the time of the late Earl of Galloway. Afterwards, he had in turn charge of the gardens at Bargaly, the residence of the late Mr. M'Kie, M.P. for the Stewartry, and of those at Ernespie, Castle-Douglas. Fifteen or sixteen years ago he became gardener to Mr. Thomson Paton, and both at home and over the Border he has maintained, with his exhibits at many first-class shows, the high traditions of Scottish horticulture. Something like 400 first awards have fallen to his lot for exhibits of fruit, flowers, and plants—some of these having been secured at International shows at Edinburgh and the Crystal Palace in strong competitions. Norwood Gardens in the hands of Mr. Kirk, have long maintained a wide reputation, not only for the neat and effective manner in which they are kept, but for the cultural excellence of the plants grown in them; and though the vineries, as things go nowadays, are not extensive, the splendid quality of the Grapes grown in them shows what can be done by a skilled cultivator. In private Mr. Kirk is held in much esteem by his neighbours in Alloa, and by horticulturists all over Scotland.

POTATO DISEASE.

The Board of Agriculture think it desirable to give further publicity to the methods which the various experiments recently reported upon in the Papers [C. 6647 and C. 7138], laid before Parliament in 1892 and 1893, indicate as likely to be useful in checking the spread of Potato disease.

Description of the Fungus (Phytophthora infestans).—The fungus which causes this Potato disease belongs to the family designated Peronosporeæ, and is recognised specifically as Phytophthora infestans. It attacks the Potato plants by means of conidia, or microscopic spores, conveyed either by the wind, by insects, dogs, rabbits, hares, foxes, and by human beings, or by means of spores from the mycelia, or vegetative centres, generated within the growing plants, and coming from infected tubers. In very dry summers, like that of 1893, there is, as a rule, but little disease. On the other hand, it has been observed that the fungus has made rapid progress in a night temperature of from 47° to 50° Fahr. and a day temperature ranging between 57° and 59° Fahr. Generally speaking, it may be said that the Potato-disease is generated, and causes more or less serious injury, in warm, showery weather, especially after electrical disturbances, and makes its appearance between June 25 and the beginning of August.

The first indications of the disease to casual observers are brown spots on the upper surfaces of the leaves. These are caused by the action of the spores of the fungus which have penetrated the under-surfaces of the leaves and set up an unhealthy action throughout the leaf-structure. On these under-surfaces, congeries, or groups, of white silky threads have been formed, from which spores are rapidly generated and distributed by the wind, or other agencies, to infect other Potato-plants. It is therefore most important to prevent, if possible, the spores from germinating. If this cannot be done, steps should be taken to arrest their progress, to prevent them from forming vegetative-centres from which countless quantities of spores may be generated, as well as the root-like hyphæ which, by permeating the leaf tissues and stalks, cause premature decay, and finally descend to the tubers, making them unsound.

Means of Prevention and Remedies.

A review of numerous experiments carried out during the last few years in Great Britain and Ireland, and in many foreign countries, makes it clear that the treatment of the plants with compositions of sulphate of copper and lime has been employed preventively with satisfactory results in most cases, in seasons of disease; but the treatment has not an unbroken record of success, and in a few instances the application of these compositions to Potato plants has even appeared to have an injurious effect upon the yield.

On the whole, however, there is ample evidence to prove that Potato plants dressed with sulphate of copper compositions offer much more resistance to the attacks of the Potato disease fungus than plants not so treated. It has also been demonstrated that when Potato plants have been attacked by this fungus, the treatment with sulphate of copper compositions has proved remedial in a considerable degree, and has in many instances arrested the progress of the disease.

M. Girard—the greatest authority upon this subject—observes that it is most imprudent to wait until disease has appeared before the sulphate of copper compositions are applied, because the fungus spreads with such rapidity in favourable circumstances, that the cultivators have not time to organise and carry out defensive measures. Treatment should be adopted as a means of prevention, even if there may not be actual disease. In short, treatment is insurance against disease; but it must be remembered that the results, both preventive and remedial, depend in a very great degree upon the time and manner of application, as well as the nature, preparation, and distribution of the compositions.

Compositions.

The most commonly adopted composition consists of 20 lb. of sulphate of copper, 10 lb. of lime, and 100 gallons of water.

This has been found strong enough for all purposes, and does not injure the foliage if it is properly and evenly distributed, and not applied to very young plants.

A weaker composition is sometimes used, made of 15 lb. of sulphate of copper, 7½ lb. of lime, and 100 gallons of water.

This is preferred by some experimenters, especially for Potato-plants whose leaves are young and tender. In experiments in Ireland last year, it was found that this composition was not so effective for treating Champion Potatos, whose leafage is coarse, as that made with 2 per cent. of sulphate of copper.

Another composition is advocated by M. Girard, consisting of 20 lb. of sulphate of copper, 20 lb. of lime, 20 lb. of molasses, and 100 gallons of water.

The superior advantages of this composition have not been seen in this country, but in wet seasons the molasses would probably make the sulphate of copper adhere better to the leaves.

Preparation of the Compositions.

The sulphate of copper should be pure. Ordinary commercial sulphate of copper contains a large percentage of sulphate of iron, which diminishes the action of the sulphate of copper, and makes the composition of a dirty-green colour.

The lime must be of the best quality, well burnt and unslaked.

The sulphate of copper, roughly pounded, should be dissolved in cold water in a wooden or copper vessel. A good plan is to put it in a coarse canvas or sacking bag, and let this hang over the side of the vessel in the water.

The lime must be slaked with cold water in a separate vessel, and the mixture, when cold, poured into the vessel containing the sulphate of copper, and passed through a fine sieve to keep back grit and other particles. The whole should then be well stirred. A bright blue liquid is the result if properly made.

The tubs, pails, and other vessels in which sulphate of copper compositions, which are poisonous, have been put must not be used for feeding animals.

Distribution.

On small areas, distribution may be effected by knapsack machines holding about 3 gallons. There are several kinds of these obtainable at moderate prices. A man can spray from one-third to half an acre per day with a machine of this kind.

Upon large acreages of Potatos a horse-machine would be required. With this from 8 to 12 acres can be sprayed per day.

The quantity of dressing applied usually varies between 110 and 150 gallons per acre.

Care must be observed to ensure regular distribution by means of fine spray-nozzles attached to the machines, which can be easily adjusted in different directions to cover evenly the upper and under surfaces of the leaves. Though opinion is sharply divided as to the necessity of spraying the under-surfaces of the leaves, it is certain that the disease is first generated there, and it would seem to be even more important to apply preventive measures to the under-surface of the foliage than to the upper-surface.

Distribution will be materially assisted by strainers fitted into the machines, and by keeping the compositions constantly stirred.

If the dressing has been regularly and properly distributed, the leaves above and below should when dry be covered with bright blue spots.

It may be necessary to spray the plants again if heavy rains should fall and wash off the dressing.

If the disease still spreads after the treatment, it will be desirable to repeat the spraying.

Cost of Treatment.

It has been stated that the cost of treatment usually varies from 8*s.* 6*d.* to 11*s.* per acre for each application of the 2 per cent. of sulphate of copper composition. The composition with the molasses costs from 10*s.* 6*d.* to 13*s.* per acre.

4, Whitehall Place, London, S.W., July, 1894.

CALOCHORTUS PLUMMERÆ.

The illustration at fig. 21, shows one of the lovely forms of Calochortus exhibited by Messrs. Wallace & Co., Colchester, at the last meeting of the Royal Horticultural Society under the name of C. Plummeræ. We may revert to its botanical history on another occasion; in the meantime, we may commend it to the notice of growers of these plants as one of the most robust and beautiful of its class. The colour is of a delicate shade of lilac.

Fig. 21.—CALOCHORTUS PLUMMERÆ [HORT. WALLACE]: LILAC.

KEW NOTES.

Isoplexis canariensis, formerly called Digitalis, or the Canary Island Foxglove, is a greenhouse shrub of some interest. There is a plant of it in flower in the Temperate-house at Kew, where it is planted in a peat-bed along with Acacias and other Australian plants. It is a shrub 3 feet high, with stout branches clothed near the top with lanceolate leaves, suggestive of the leaves of the Canary Island Echiums. The flowers are borne on erect spikes 1 foot long; they are tubular, 1 inch long, and coloured orange-yellow, and they differ from the flowers of Digitalis in having an upper and lower lobe of equal length. There is one other species, viz., I. sceptrum, a native of Madeira, but I do not know that this is in cultivation.

Trichocladus grandiflorus.

A specimen of this is now in flower in the Temperate-house. It was raised from seed sent to Kew from the Transvaal by Mr. E. Galpin in 1890, who described it as a handsome tree, 15 to 20 feet high, with white flowers produced in September, the fruit ripening in May. It grows at an altitude of 4000 feet in the wooded ravines of Moodies, near Barberton. The Kew plant is 10 feet high, freely branched, with ovate-lanceolate alternate leaves, 3 to 6 inches long, brown when young, green when mature. The flowers are borne in short terminal clusters on the branchlets, are composed of a short brown tubular calyx, and six wavy strap-shaped petals an inch long. They are similar in general characters to those of Hamamelis arborea, to which genus Trichocladus is closely allied. A figure has been prepared from the Kew plant for the *Botanical Magazine*. This species is a likely little tree for subtropical latitudes.

Mutisia ilicifolia.

Under tab. 6009 of the *Botanical Magazine*, this species is described as a very variable plant, the stem being winged and spinous-toothed or wingless, the leaves glabrous or tomentose, variously lobed, and the number and breadth of the ray-florets varying. The variety represented in the *Botanical Magazine* differs markedly from one figured in *Paxton's Magazine of Botany*, and also from a third one figured in the *Garden* some years ago. Still another form is now in flower in a cool greenhouse at Kew. It has stems at least 15 feet long, striated, the leaves not at all decurrent, spinous only near the apex, the peduncle 3 inches long, and the flower-head 3 inches across, with nine ray-florets each 1½ inch long, ⅜ inch broad, and coloured pale rose; the stigmas are dark brown. This is said to be the M. truncata of some authors. It has been in its present quarters about six years, and although it has always grown as rampantly as a Sweet Pea, it has never flowered before this year. It is a native of Chili. A plant of the gorgeous M. decurrens is now flowering freely against the wall of the Museum, facing the Palm-house.

Hæmanthus candidus.

This is a new species, first described by Mr. Bull in his *Catalogue of New Plants for* 1894, and now flowering at Kew for the first time from bulbs imported direct from Natal. It is a handsome plant, of robust growth, with large heads of pure white flowers, the golden-yellow of the anthers being an additional charm. It belongs to Baker's subgenus Diacles, in which the bulbs have thick bifarious tunics, the leaves thick and fleshy, and the spathe-valves and perianth segments permanently ascending. The Kew plant has leaves 5 inches wide, rounded at the apex, glabrous above, covered beneath and on the margin with short white hairs; peduncle erect, stout, 10 inches long, clothed with white hairs, and surmounted by a dense head over 4 inches wide of white flowers, surrounded by reddish membraneous spathe-valves an inch long; the flower-pedicles are half-an-inch long, the tube a quarter of an inch, the linear segments five-eighths of an inch, and the stamens an inch long. It is as striking as H. coccineus, and likely to prove as useful.

Crinum Schimperi.

The plant noted by me a fortnight ago (p. 63) under the name of C. abyssinicum proves to be C. Schimperi, Vatke, figured in *Gartenflora* in 1889, p. 561, t. 1309, from plants cultivated in the Berlin Botanical Garden, whence bulbs were obtained for Kew in 1889, which are now flowering for the first time at Kew. Both species are natives of Abyssinia, and C. Schimperi has proved sufficiently hardy to be grown in an unheated frame, where it has made fine leaves and pushed up stout scapes bearing white flowers as large as those of C. capense. The bulbs supposed to be C. abyssinicum were received from Herr Max Leichtlin, Baden-Baden, and on the correctness of this name being questioned I wrote to him for the history of his bulbs. His letter is of sufficient interest to be printed, as it records the history of the introduction of C. Schimperi, and also tells an interesting story of Schimper himself:—

"Crinum abyssinicum = C. Schimperi.

"Schimper was a native of Heidelberg, and went to Abyssinia as a naturalist. He was kept a captive by King Theodore, and was liberated by the English when they stormed Magdala. His wife was related to the Negus Johannes, and Schimper became somehow a sort of councillor to the Negus. He had not ceased to be a 'loyal subject,' as they say in England, of the Grand Duke of Baden, and, having a family, he asked the Grand Duke to do something for his son. The Grand Duke paid for his education, and during several years he studied at the Polytechnic School at Karlsruhe. He gave me one morning Acidanthera bicolor, hitherto never known in Europe. Old Schimper, to show his gratitude to the Grand Duke, collected a large quantity of roots in Abyssinia, and sent them on to Karlsruhe. It was a large cask, full of rotten material on arrival at Karlsruhe, but the Grand Duke's Court gardener, M. Meyer, a very intelligent man, tried to save whatever he could. Kniphofia comosa, K. Leichtlini, and Crinum abyssinicum, were among the saved. As both Meyers, father and son, are dead, I cannot ascertain if a label of Schimper with the respective indication was found in this sending, or whether Professor Seubert, the then Director of the garden, had given it a provisional name! In fact, I got the plant as Hypoxis abyssinica from there, but it was obvious that it could not be a Hypoxis. This is all I know about the plant sent you as C. abyssinicum." *W. W., Kew.*

BURFORD, DORKING.

Sir Trevor Lawrence's pretty gardens never, perhaps, looked better than at the present time, the recent rains having caused an unusual luxuriance of growth and profusion of flowers on the many beautiful plants here cultivated in the open ground. Most remarkable are the great masses of Crinum Powelli and C. Moorei, which are furnished with scores of stately heads of large pink-and-white flowers. Then we come to a large bed of Crozy's flowering Cannas, with superb colours in yellow, red, crimson selfs, and in spotted varieties of the same colours. Lemoine's Gladioli, too, are extremely beautiful; and the large beds of Montbretias, left undisturbed all the winter, masses of bloom. Roses and other favourite flowers are in profusion; and among the most cherished plants in the alpine garden are some pretty little species of Dianthus, brought home by Sir Trevor from the Tyrol; and a pretty dwarf and bushy rose-coloured Epilobium, collected at the base of the glacier on the Stelvio Pass. But in this small estate, nestling beneath Box Hill, is a feature which would please many, as much as the showy and interesting flower-garden, viz., the long winding walks in the dense wood, stretching to the foot of the hill, and which, for solitude and natural sylvan scenery untampered with, is on a level with any spot of similar extent in this country.

In the greenhouses, the tuberous Begonias are making a great show; the orange-red coloured Streptosolen Jamesoni is covering a wall with its richly-coloured blooms; Nemesia strumosa is brighter and better than in the beds outdoors; the fine blue Exacum macranthum, and the delightfully fragrant E. affine are covered with flowers, and with them a flower of a similar class with lavender-blue flowers with white and purple eye. Eustoma exaltata is proving itself well worthy of cultivation; the pretty violet Saintpaulia ionantha and the pink Cienkowskia Kirkii are also among the most striking of the many pretty and uncommon things here to be found.

It is too commonly supposed that these are allowed to over-ride all other subjects at Burford. Such is not the case, for in the gardens, under the care of Mr. W. Bain, the gardener, all good new things find a place, and get quite as much care bestowed on them as the Orchids at the hands of Mr. W. H. White, the custodian of the latter.

The Orchids.

Taking a comprehensive view of the collection of Orchids at Burford, several salient features present themselves. The first is the extraordinary number of species included in it, and the consequently large number of plants to be met with there, which are not seen in other gardens. The second is the remarkably good condition of this great and varied collection of plants, and the number of things there found, which are usually deemed mere botanical curiosities, but which, when well-grown, and in a manner suitable to displaying their charms, are here redeemed from that reproach, if reproach it be. Beyond these peculiarities the visitor will not fail to note some things which are what is commonly called "growing like weeds," but which are to be found nowhere else in tolerable condition for any length of time. Among these a fine example is the great quantity of Habenaria militaris in the Phalænopsis-house, which have been propagated at Burford from a small stock, and which are now about to produce a grand display of carmine-vermilion flowers above their beautifully painted foliage, scarcely a plant among them failing to bloom. Doing equally well are the plants of that still more difficult subject, H. carnea, and H. Susannæ, and another fine species are also thoroughly at home, and about to flower. In the same house are some fine specimens of Cattleya crocata, Rchb. f., with several spikes of pure white flowers, with orange throat, the spikes bearing three flowers. Also a beautiful example of C. crocata rosea, with pink and orange flowers. Probably a better descriptive name for this fine plant would be C. eldorado crocata, but in the larger growth of the plant, the larger flowers and the greater number in an inflorescence, there was reasonable excuse for separating it. Compared with ordinary C. eldorado and its white variety, Wallisii, this strain is immeasurably superior. Other beautiful plants in bloom were the fine blue Aganisia cœrulea, the pretty A. ionoptera, Luisia Amesiana and L. volucris, two of the most extraordinary of the singular genus, illustrated in the *Gardeners' Chronicle*, July 8, 1893.

Another instance of unchecked success is to be found in the Masdevallia-house, which we have never yet visited without finding it more or less gay with flowers borne on vigorous plants. Besides the showy species in flower, are always a number of singular plants. Among the most curious at the present time is Masdevallia muscosa, with its slender mossy flower-stem, and sensitive lip, which closes like a trap on being touched. Other neat-habited and beautiful species in bloom were M. × Gelengiana, M. astuta, M. peristeria, M. Roezlii, M. calura, M. Reichenbachiana, M. Rolfeana, M. platyglossa, M. campyloglossa, M. demissa, M. tridactylites, M. Wagneri, Pleurothallis macroblepharis, P. picta, and P. rhombipetalum, a curious species with Restrepia-like flowers.

In the large warm-house, a very large and valuable collection of Cirrhopetalums and Bulbophyllums are suspended overhead, the curious B. barbigerum, with feather-like motile lip, being one of the most singular; B. exaltatum is also a curious species, with spotted and fringed flowers. In this house, Eucharis grandiflora thrives and flowers well, planted beside the walk; and at one end, the collection of Cypripediums of the C. bellatulum section is in remarkable health. Also in flower were Dendrobium Bensoniæ, D. × rhodostoma, Cycnoches chlorochilon, C. Egertonianum, Thunia alba, and other species.

In the next intermediate-house, a fine pure white Cattleya Gaskelliana alba, good C. Dowiana, the rare Miltonia Schroderiana, Trichopilia Galeottiana, Lælia Digbyana, L. × Amanda, Trichocentrons, Stanhopeas, and other species are in flower or bud; and in this house the beautiful scarlet Epiphronitis × Veitchii and Sophro-Cattleya × Batemaniana are thriving and being propagated as quickly as their slow growth will permit.

The next large house contains a fine collection of Sobralias; and with them a rare

Elleanthus, which is much like a Sobralia in growth. The giant Sobralia Cattleyæ which none succeeds in flowering, is turned into the open garden to see what can be effected by that treatment. In flower are Sobralia xantholeuca, S. macrantha, S. Warscewiczii, and a species allied to it, but with carmine-crimson flowers; and other species are well advanced in bud. In one corner, Epidendrum × O'Brienianum is sending forth its beautiful heads of reddish-crimson flowers, and the singular Cœlogyne sulphurea and Oncidium varicosum are blooming strongly.

In the large Cattleya-house, the show of the varieties of C. labiata being almost over, there remain in bloom but some C. Mendeli and C. Gaskelliana; with them are a very fine variety of the pretty C. Rex, a good specimen of the wholly yellow Lælia xanthina agraphis; some Vandas, among which one very fine example of V. tricolor planilabris bears a seed-vessel full-grown, obtained by crossing with V. (Arachnanthe) Cathcarti, which should produce something extraordinary. Cœlogyne Sanderiana and other Cœlogynes have here been flowering profusely. In this house the large plants are placed on revolving iron stands, for which the idea was taken from those in the late Mr. Hardy's collection, and which have been improved on by Sir Trevor Lawrence, who succeeded in getting Messrs. Stone & Turner of Dorking to make them at a reasonable rate. Their use would save the life of many a large specimen, which would otherwise perish, in whole or in part, from being grown under the shade of other plants, without its position being changed, as it can be daily with ease by using the revolving stand.

The Aërides, &c., in the East-Indian House are in capital condition, and the Calanthes in them putting on very stout growths. Many species of Aërides, Angræcum, and Saccolabium are sending out flowers, and in bloom are Aërides suavissimum, Angræcum Scottianum, many Oncidium Krameri, &c.

In the stove-house the gigantic Grammatophyllum speciosum assumes larger proportions every year, but as yet has not flowered. In the various small houses the work of raising plants by strange crosses which promise some remarkable novelties is being actively carried out. One of the finest now in flower is the Burford Cypripedium × Lawrebel, and in the same house the rare Pachystoma Thompsonii is in bloom.

In the cool-houses are many Odontoglossum, Oncidium macranthum, the rich orange-lipped O. Loxense, Disa grandiflora, some large white Maxillaria venusta, M. grandiflora, the pretty M. Hubschii, M. Amesiana, Nanodes Medusæ, Epidendrum prismatocarpum, and other species, Lycastes, &c., in bloom.

In the little lobby, where the species of Lissochilus and Eulophias are grown, the pretty rose-lipped Polystachya Lawrenceana, a new species from Eastern Africa, has many flowers; and other Polystachyas are sending up spikes, and in every part of these gardens new objects of interest are continually appearing. *J. O'B.*

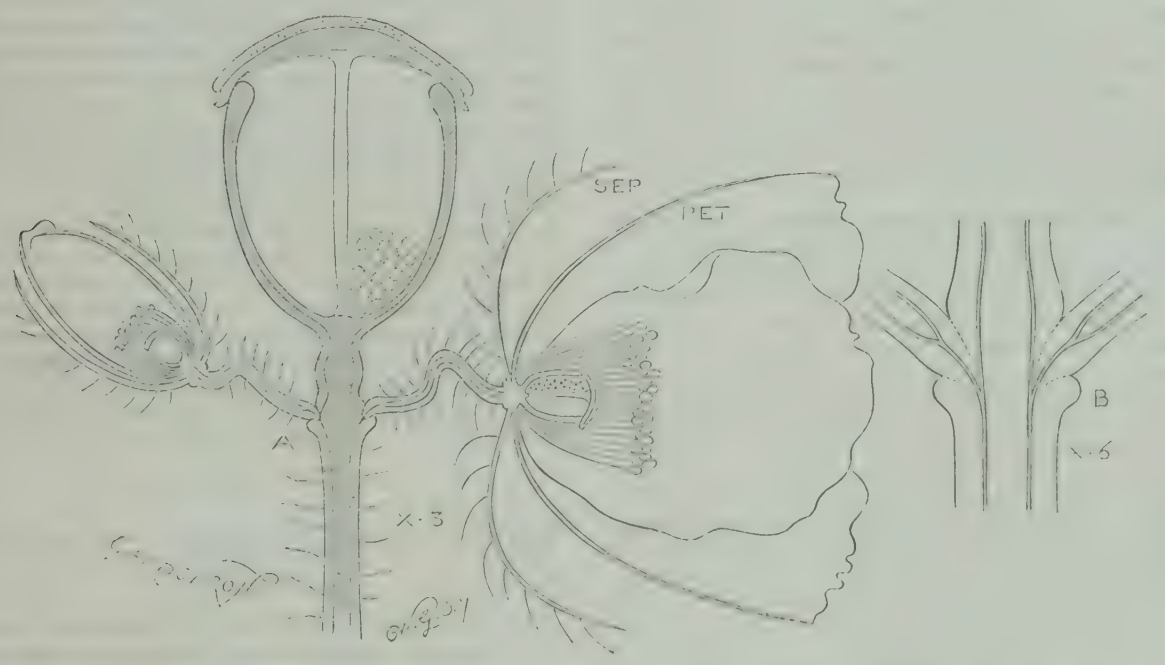

Fig. 22.—section through a flower of a monstrous poppy, showing axillary prolification.

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

July 24.—Present: Dr. M. T. Masters, in the chair; Dr. Morris, Mr. Blandford, and Rev. G. Henslow, Hon. Sec.

Photographs.—Dr. Masters, on behalf of Mr. Nicholson, exhibited photos of the "Lily pond" at Trelissick, Truro, on the property of C. D. Gilbert, Esq., showing great quantities of Richardia æthiopica bordering a pond, together with Nuphar. Large clumps of Gunnera manicata and a fringe of tall-growing Primula japonica occur on the higher ground. Another view illustrated fine masses of Benthamia fragifera in flower.

Carnation Sports.—He also showed several varieties of colours in Carnations (flaked, self, &c.), the flowers having been all gathered from one and the same seedling plant.

Poppy, Monstrous.—He also showed a drawing by Mr. G. W. Smith, of a field Poppy (fig. 22), in which two normal flowers-buds had issued from the axils of opposite petals (axillary prolification).

Vine Diseased.—He also showed a fragment of a bunch on which the whole of the flowers were aggregated into minute woolly balls. The petals remain closed, but without having any stamens or pistil within them. The hairs (ribbon-like and twisted, resembling cotton-hair) grow mainly from the margins of the petals. It is known to be caused by a Phytoptus; but as the insect or fungus is not always present, Mr. Henslow observed that it may be the result of atrophy of the essential organs, accompanied by an excess of hair as a compensatory process, according to a theory of M. Mer.

Gentiana acaulis, Diseased.—Dr. Morris exhibited a specimen, and observed that if it be sprayed with Condy's fluid at an early period, the fungus may be kept in check; but large masses must be burnt if they be badly attacked, as the disease is due to Puccinia Gentianæ, and if the plant be not destroyed, the resting spores will get into the soil and reproduce the disease in the following year.

Products of the Banana.—Dr. Morris also exhibited a collection of various products obtained from the Banana, exhibited by the "Stanley Syndicate," at the Universal Exhibition at Antwerp, 1894. Mr. Stanley had called attention to the great value of this fruit in his *In Darkest Africa*, and the investigation was carried out by Mr. Hartogh, engineer at Amsterdam, to discover for what uses the Banana was available. Its chief value lies in the great quantity of starch (80 per cent. of the dried pulp), hence it proved to be a very good source of spirit, as "the quality of the alcohol may be considered good." It was also found to be especially available for the manufacture of glucose, while the meal mixed with one-third ordinary Wheat-flour makes a very nourishing material for bread, cakes, &c. Among other uses, gruel, puddings, marmalade, syrup, &c., may be mentioned; while the dried peel, and flour of the peel, would be useful for fattening pigs. Lastly, the fibre can be used for paper and string. Persons desiring to have more ample information, or who would like to take part in the proceedings of the Stanley Syndicate, can address themselves to the latter, Avenue Copes, 24, The Hague.

HOME CORRESPONDENCE.

PUCCINIA RIBIS, D.C.—The Rev. Dr. Keith of Forres has met with this fungus in the north of Scotland. It occurred upon the foliage of Currant bushes in the garden of the Manse, at Dallas, where its presence had been noticed for several years, although its true affinities were unrecognised until Dr. Keith examined it in the earlier part of July of the present year. The species is interesting as being one to which an Æcidium (*Æ. grossulariæ*) has by some writers been affiliated on the ground of host-plant affinity. This association is now known to be incorrect, in the same way as the association of Æcidium leucospermum and Puccinia fusca on Anemone nemorosa. This is also purely imaginative, as has recently been demonstrated by Mr. Soppitt. P. ribis is a micro-puccinia, having no uredospores, and is easily recognised by its dark brown sori being seated on distinct yellow spots on the leaves of the affected plants. It was first described by De Candolle in his *Flore Française*, vol. ii., p. 221. It never occurs on the Gooseberry foliage, nor is it connected with the Æcidium on black Currant, which the Rev. Canon Du Port first detected on the Norfolk Broads a few years ago, and which is an heterœcious species. *Charles B. Plowright, M.D., King's Lynn, July 25.*

LILIUM HORSMANNI.—I think a few remarks as to the history of naming this Lily are necessary, after Mr. Wilson's letter in your issue of July 14. It first flowered here in 1878, when the late Mr. Fred Horsman was associated with the New Plant and Bulb Co. (a very few bulbs having been imported direct from Japan), and was named after him. It is described in their Catalogue for 1879, and also named and described in Dr. Wallace's *Notes on Lilies*, p. 161, 2nd edition, published 1879. I do not know at what date Mr. Wilson received his Lilium Thunbergianum cruentum, but a plant of that name was certificated by the Royal Horticultural Society in 1882. If this be the same plant as the L. Horsmanni, shown by me on July 10 last, surely priority of name belongs to the late Mr. Horsman. It has always been a very scarce Lily with us, and until quite recently we have had no stock, only an occasional straggler appearing amongst our importations. *Robt. W. Wallace.*

PEAS FOR MARKET.—A West Middlesex market gardener informed me a few days ago, that good Peas were selling in the London markets at one shilling per bushel, and it was difficult to effect a sale at that low price. Considering that about sixpence per bushel is paid for picking, saying nothing about culture and cartage, the profit from the transaction is a microscopical one. It is the early crop which pays, as when the glut comes the market is overstocked. My informant had this season been growing Improved Sangster's No. 1 for an early crop, sown soon after Christmas; a good hardy Pea, but to use the words of the grower, not so good a stock as could be bought twenty years ago. For the future it will be discarded, and Eclipse, an early round blue variety, substituted for it. The latter is not quite so hardy as Sangster's, but when sown early in February it turns in as quickly, and is better in several respects. I do not know who introduced Eclipse, but it is undoubtedly an excellent early variety both for market and garden purposes. For a late crop, my informant grows Dr. Maclean, Prince of Wales, and Yorkshire, but the former is preferred. It is necessary to sow these in March, otherwise, if later sown, the haulm is attacked by mildew, and the crop lost. Dr. Maclean is thus the favourite variety

for a late crop. It is a melancholy fact, that while the grower can scarcely recoup himself the expense in growing Peas, the consumer in the suburbs of London has to pay a high price for them, and then not always fresh. This is the fault of our present system of distribution, but how it is to be altered is a question hard to be answered. The suburban greengrocer has to fetch his goods from London in most instances, and then be at the expense of sending them to his customers. *R. D.*

THE SPLITTING OF MELONS.—It is with the smooth and the more tender-skinned varieties of Melons that the evil of splitting is most prevalent, although sometimes netted sorts are badly split. It is unfortunately the most promising fruits just on the point of changing colour that split. What the cause is, is enshrouded in doubt. Some gardeners seem to put the whole blame on insufficient ventilation at that time, and by attending well to this important item Melons may be altogether prevented from splitting. But that this is the sole reason I am doubtful about. Other gardeners have told me dryness at the roots is a preventive; others cut the fruits when approaching ripeness, and ripen in a dry warm room. That a Melon should be ripened in a dry and warm and well-ventilated structure to induce good flavour we all know, but to cut fruit several days before they are ready for consumption, or ripen them on the plants in dust-dry soil, can never ensure the flavour being good. The worst case of splitting that has come to my notice was a house in which the plants were planted in a bed of loam 3 inches thick, tightly rammed; the plants were well cropped, and the fruits of good size; the house was well ventilated, and a small amount of air left on all night, with comfortable warmth in the pipes. These fruits split badly. For my own part I am more inclined to the belief that from some cause or other the skins get tight from a slight check, and will not expand. It may be that by chance the soil about the roots has got too dry about the time the seeds form, or the hot-water pipes have been kept too warm when the sun was shining, so as to cause a parching air in the house. Or it may be the fruits were chilled, and the skins thereby rendered inelastic. Something, indeed, more than insufficiency of ventilation; moreover, I am very sure that dryness at the roots does not prevent splitting, nor half severing the stem behind the fruit. To obtain the best results with Melons the plants should be kept duly supplied with moisture at the roots all the time, gradually reducing moisture in the bed when the fruits are about to ripen, when also the air of the house should be kept drier. *H. Markham, Mereworth Castle.*

RIPE PEACHES OUT-OF-DOORS FROM JUNE TO OCTOBER.—In the southern, western, and eastern counties of England, Wales, and Ireland, and in the southern counties of Scotland, with good cultivation and suitable walls, a regular succession of ripe Peaches of excellent quality is easily to be secured from trees growing in the open air from the beginning of the last week in June to October. [If you could always get the wood matured. Ed.] This is to be accomplished by selecting healthy trees of Alexander, Waterloo, Amsden, and Hale's Early, and planting one tree of each of the three first-mentioned varieties on walls having south, west, and east aspects, giving south and west aspects to Hale's Early. One tree in each position. The varieties indicated and thus planted, will yield a good succession of ripe Peaches in ordinary summers from the end of June to the middle of August. From this date trees of Early Grosse Mignonne, Dymond, Crawford's Early, Crimson Gallande, Bellegarde, Grosse Mignonne, Royal George, Prince of Wales, Violet Hâtive, Barrington, and Sea Eagle, will continue the supply as far into the autumn as good Peaches can be obtained out-of-doors in ordinarily good summer and autumn weather. Salway is a still later variety than Sea Eagle, and in some seasons—as was the case last year—it ripens its fruit satisfactorily enough; the fruit, when well ripened, being large and suffused with a rich golden colour. This year we commenced picking ripe fruits of Alexander from a tree on a south wall on June 23, being a few days earlier than Waterloo on the same wall, trees of Alexander from a tree on a west wall continuing the out-door supply, and we are now, July 23, gathering good-sized highly-coloured fine-flavoured fruit of Amsden from a tree on a south wall. The above supplies were and are being obtained concurrently with supplies yielded by trees under glass of some of the varieties named above. To be rewarded with success it is important that, to begin with, good healthy young trees be obtained, these should be planted in properly-prepared holes, i.e., made of a good size, given ample drainage, and good sound loamy soil to grow in, and they should be kept well supplied with moisture at the roots during the growing season and the foliage kept clean. In addition to these cultural injunctions the fruit should be thinned out to about nine inches from one another every way on the trees when a good set is obtained. *H. W. Ward.*

VERBASCUM AND SHIRLEY POPPIES.—Excellent effect is obtained in the recesses in the front of a shrubbery, on banks and other places, by growing together Verbascum thapsus and Shirley Poppies. The former, planted somewhat thinly in the autumn or early spring, the seeds of the latter sown in all space between them during the months of February and March. Verbascum Chaixii would show as good effect, though it is not so tall and stately a species as our native Shepherd's Club; but for fine effect, Verbascum olympicum would prove more showy in such associations. Needless to say, the distinct white woolly leaves, bold spikes, with yellow flowers of the Mulleins, not only give contrast in the matter of colour—they also break the monotonous evenness of beds of these Poppies, and prove excellent supports for them when full grown and heavy-headed. These Verbascums are biennials, and need to be sown a year before they are fit for the above-named purposes. *William Earley.*

VINE-LEAVES CLUBBING.—It may interest your readers to hear of the use of sulphate of iron in the cure of clubbing of Vine-foliage being corroborated. Last year one of my Vines had it to a great extent, along with the characteristic spots on the bark. I shortened it down in the autumn, washed the stem with a solution of the sulphate, 1 oz. to the pint of water, and this year it shows no trace of the disease. *B. Piffard.* [Browning, "Brunure," due to a slime fungus, Myxomycete. Ed.]

TRANSPLANTED DWARF KIDNEY BEANS FOR EARLY CROPPING.—Such a decided advantage is obtained from plants of Dwarf Kidney or French Beans, sown in boxes betimes, and subsequently transplanted out-of-doors, over seeds sown in the open ground, that the wonder is the practice is not universal; any way, it is worth making a note of. Seeds so sown about April 10, and when well up and the plants are strong, duly hardened and transplanted on to sheltered borders, give excellent crops a fortnight or three weeks before ordinary outdoor sowings. Taking this particular season as an illustration: I sowed the seeds in the bed of my Tomato-house, beside the Tomato plants, at the above date, transplanted them thence direct to the open ground on May 4. Protected them (happily with shrub branches) on the night of May 21, and as a result, had a good gathering on July 15. Whereas, such as were earliest sown in the open ground are only now flowering, July 23. Properly treated, being planted out more thinly than when sown in rows, these Dwarf Beans succeed best when so transplanted. *William Earley.*

DO LEAVES ABSORB MOISTURE?—Noting in the "Answers to Correspondents," in your issue of the 21st ult., the foregoing interesting physiological matter, I have been induced to test it in a simple way—by immersing a large Cabbage, which, having been cut for use four or five days previously, had assumed a wilted and a yellowish colour in the exterior leaves (all but its base and stem), in a bucket of water, for about twelve hours, when it resumed a vitality and crispness almost equal to that at the time of its severance from the roots, thus conclusively proving that such structural leaves as the Brassica family do absorb moisture through their stomata. I have not as yet tested Holly leaves in a similar manner, but apprehend it would prove a much more difficult problem to solve, at least, so far as time and observation would be involved. *W. G., Birmingham.* [The point is, do leaves in the natural state absorb water? We all know that they do so under circumstances such as our correspondent mentions. Ed.]

YOUNG STANDARD FRUIT TREES.—Although at this season work is very pressing in the fruit-garden, if time will admit of its being done, it repays the labour of the gardener to regulate the growths on the above, which, if hard pruned in the winter, make large quantities of young wood sometimes, many of which are useless in building up a crown, and must be removed next winter. If these shoots are now spurred back to within a few buds at the base, those remaining intact to form the leading shoots, will grow strong and mature thoroughly. A young tree with four stout shoots left at the winter's pruning should have two new ones left on each, making eight from which to select next winter. Again, it will occur that a shoot or shoots will take the lead, and weaken the others; and each strong shoot must be stopped by having the tips cut off, thus allowing the weaker shoots to make faster progress. The fastenings of young trees should be examined about this date, loosening them if likely to cut into the rind. Artificial watering will not be needed by these young trees this season, nor will mulching, except on the lighest class of soils. *H. Markham, Mereworth Castle.*

THE POTATO DISEASE AND LIGHTNING.—I have watched very closely the Potato crops hereabouts for the first appearance of the disease. On Saturday morning, July 28, there was no trace whatever of the disease to be found, and on inquiry I could find that no disease had been detected hereabout; but on Sunday morning, between three and four, a very heavy thunderstorm broke over the district, and, later in the day, on passing my Potatos I detected unmistakeable signs of the disease, this being the first appearance (July 29). On Monday morning I again visited my Potato-field, and found that the disease had spread with alarming rapidity, there being a stretch right across the piece, as though a wave of great heat had passed across, the leaf and haulm being covered with black spots, and the whole already beginning to smell very disagreeably. In going over the crop, I found nearly all the plants to be affected more or less. It is, however, very interesting to note that the disease is most discernible amongst Beauty of Hebrons and Early Puritans, a few stray roots of Magnum Bonum standing quite erect and green, and not in the least affected. Immediately on noticing this quick change in the prospects of the crop, I visited, and made enquiries of other growers, with the same results. They had only just discovered the disease in their crops. In one instance, Magnum Bonums are badly affected, and one grower had already commenced to lift his Puritans, &c, having discovered that the disease had just commenced. Probably, some of your numerous readers can give us some further information. For my own part, I am quite convinced that the Potato disease is caused by lightning. *E. C., Somerset.* [The condition of the weather at such times favours the growth of the fungus. Ed.]

THE FLOWER-BEDS IN HYDE PARK.

I.—What charming well-selected varieties of bedding-plants are employed in filling the beds that are situated between Stanhope Gate and Grosvenor Gate, in Hyde Park! Each year the method of planting undergoes a change. It is a critical public whose tastes and fancies Mr. Brown, the superintendent, has to study to please, and well he does it.

Having viewed the beds quite recently, I am of opinion that for the time of year, the condition of the plants was everything that could be desired in that direction. A bed of oblong form, near Stanhope Gate, filled with the large flowering variety of the white Marguerite, and edged with a pale blue, white-eyed Lobelia Earl of Beaconsfield, is a bold-looking one, and is good as a colour arrangement. Another bed of like shape, having a ground-work of Alternanthera major, with dot plants of Dracæna lineata in the centre, D. rubra, Palms, Farfugium grande, Centaurea candidissima, Lobelia Blue King, Begonia Emperor, and Chlorophytum elatum variegatum; the whole being edged with a broad band of Antennaria tomentosa, has a very pretty effect. Another oblong bed is planted there, an outer edging of Alternanthera paronychoides aurea, then a line of Lobelia Earl of Beaconsfield, set 1 foot apart, followed by a band of Iresine Wallacei, and the central space inside of these bands carpeted with Lysimachia Nummularia folio-aurea, and in which plants of seedling tuberous-rooted Begonias and Grevillea robusta are thinly planted, the effect of the whole being pleasing. A circular bed, hard by Grosvenor Gate, is planted with plants about 2 feet high, of Araucaria excelsa, Begonias, Chlorophytum elatum variegatum, on a ground-work of Herniaria glabra, edged with Alternanthera major

aurea, forming a striking contrast to the neighbouring beds. Some of the beds are filled with Pansies, and others with standards of Heliotrope, Roi de Noirs, Fuchsias, Nicotiana affinis, the plants being set on a carpet of Duchess of Fife Pansy, &c., and edged with suitable plants. Only one bed of the "carpet pattern" was observed, and that was an excellent example of the kind, the design well conceived, and admirably planted. *H. W. W.*

II.—Two beds of Ivy-leaved Pelargoniums, carpeted with Viola Mrs. Turner, are doing remarkably well. The usual beds of Roses have been doing well, but have been cleared out to make room for Erythrina Crista-galli, which promise to make a good show. A bed of pink Begonias having some dwarf standards of Heliotrope Swanley Giant springing out of them looks like being a feature later on. Two beds of Sweet Peas have done remarkably well this summer, and are now coming on with a second batch of blooms, the dull wet weather seeming to have suited them. Near them is a large circular bed filled with Plumbago capensis, having some plants of Ivy-leaved Pelargonium Abel Carrière between them carpeted with Cineraria maritima, a new, distinct, and pretty feature. On either side are two beds planted with pink Pelargoniums, tuberous-rooted Begonias, Centaurea candidissima, blue Lobelia, and Amaranthus cordata. Two beds comprised of Acacia lophantha, and the Golden Privet, with Begonias semperflorens rosea and alba make a very pleasing combination.

An attractive pair of beds is planted with crimson Pelargoniums and Phalangium variegatum, carpeted with the pale lavender-coloured Viola Bessie Clark; Begonia Charles Baltet, in a groundwork of Harrison's Musk edged with blue Lobelia, is also a very good combination, as is that one consisting of Fuchsia Empress of Germany carpeted with Viola lilacina and dots of Lilium longiflorum. A bed of French Cannas and Nicotiana affinis is on a fair way to make a good show. We now come to what is a very pretty bed, planted thus: The old Pelargonium denticulatum, with its dark green foliage, contrasts well with the variegated Phalangium, having a ground-work of a cardinal-coloured Mimulus. Fuchsia Mrs. Marshall, having a ground-work of the Mauve Viola William Neil, is a very telling bed Next is a very pretty bed of pink Pelargonium Titiens, with Begonia semperflorens, Princess Beatrice, having a carpet of Viola Holyrood.

A bed of Fuchsia Scarcity, carpeted with Viola Ardwell Gem, a pale yellow, makes a happy combination; Lady Stanhope Begonia, with a ground-work of the lavender-coloured Viola, Mrs. Turner, looked well.

Two circular beds near Grosvenor Gate, the one with Begonia semperflorens rubra, the other with B. s. After Glow, both of them having a ground-work of Harrison's Musk, edged with the old Erica carnea, make two very pretty beds. Taking a turn back and viewing the beds on our left under the boundary fence, we have a very pretty run of beds. The centre one having a dark Canna Adrian Robini and Fuchsia Earl of Beaconsfield, with a groundwork of the Crimson Mimulus, make a pretty combination. It is flanked on either side with beds of Heliotrope President Garfield, which are raised at each end by the surface being mounded up, therefore somewhat breaking up the stiff line so often seen. On each side of these we have two more beds treated in a somewhat similar way by having their surface mounded up in the centre. They are planted with various sorts of Bamboos, having some standard Fuchsias between them, with Begonias and Petunias planted under them, with a groundwork of Alternanthera paronychioides major. It may hardly be said that these buds are quite an attraction. Another bed with Begonia heracleifolia and Fuchsia Mrs. Randall, looks very well.

On either side of the entrance-gate at Mount Street are two circular beds of Begonia Emperor, with a carpet of Mesembryanthemum cordifolium variegatum, which will soon present an attractive appearance. *J. B.*

JAPANESE GARDENS.

"Oh, to be back in Nikko, plucking the heavy-odoured blossoms of the wild scarlet Azalea, almost as big as Arum flowers, on the high bank over the path which leads to Dai Nichi Do, or tufts of pure white Azalea, from trees 40 feet high, in the woods between the Lake of Chiusengi and the great mountain Nantaisan. Dai Nichi Do! The gardens of Dai Nichi Do and the Mangwanji monastery are the nearest approach to a child's fairyland I ever saw.

"They are so-called Chinese gardens—Japan used to borrow as freely from China and Corea as she borrows from the West now—and they bear exactly the same relation to the stately pleasure-gardens of the Howquas at Canton, or the peerless mandarin gardens at Shanghai, as the enchanted places of Hans Andersen do to the earthly paradises of William Morris.

"These Chinese gardens, toy-gardens, all have a strong family likeness—a little artificial lake of pellucid brightness, a little artificial waterfall fit for a naiad's fountain, both fed by a little sandy-bottomed brook or conduit of clear spring-water, bubbling like champagne; a cluster of little islands (one of them perhaps shaped like a tortoise), affording opportunities for impossibly quaint little stone bridges), circle-backed, horse-shoe backed, or flat slabs of portentous size, and every member of the cluster with its little stone pagoda, its quaint daimio-lantern, its toy-shrine, or the fantastic bits of rock for which the Japanese pay such extravagant prices.

"On little artificial promontories will stand Maples—plain Maples, copper Maples, variegated Maples, all with the fine splintery leaf of Japanese Maples, trained into whimsical shapes, though not so whimsical as the Fir trees (Matsuji), which rival the Box-edge peacocks and other armorial bearings in old English baronial gardens, such as Haddon Hall. In the garden of "The Golden Pavilion" (Kinkakuji) at Kyoto I saw a Fir tree tortured into the similitude of a junk in full sail. Where the stream runs into the lake there will be a bed of stately purple Irises, and built out into it on piles, or spaning a narrow arm as a covered bridge, a Wistaria-arbour with blossoms 3 or 4 feet long.

"The wild Wistaria itself grows profusely at Nikko, but its blossom is much smaller. A terrible obstacle to get through is a Wistaria thicket, with its tough lianas and intricate web of branches, as we learned to our cost in striking a bee line from the red lacquer bridge to the top of Toyama. Wild Wistaria, wild Azalea, wild Camellia, wild Iris, wild Lilium auratum, wild Cherry, wild Plum, wild luridly-scarlet Japonica, make the woods and gorges of Japan a blaze in spring; especially the burning scarlet of the Camellias and Azaleas. On a slight eminence commanding this fairy scene will stand the pasteboard monastery for which it was created. I say pasteboard, because Japanese monasteries are, for the most part, made of light wood-work and paper. And behind will be the temple, great or small, and on different points of vantage a pavilion, a kind of temple and belvedere combined; and a cha-no-ma, a sort of summer-house for the solemn tea ceremony, which has a semi-religious significance in Dai Nippon." *From "The Japs at Home," by Douglas Sladen, pp. 274, 275.*

BEARWOOD, WOKINGHAM, THE SEAT OF JOHN WALTER, ESQ.

Mr. Walter, with his usual kindness, gave permission for visitors to look through his pleasure-grounds during the month of June, when the magnificent masses of Rhododendrons and Kalmias were at their best. It is at places like Bearwood that the visitor realises something of the splendid decorative service the hardy Rhododendron renders in ornamental grounds, especially when seen as they are in such large masses; and it is possible to realise the profound truth of the statement that "Rhododendrons are now more emphatically than ever the pride of European gardens," It may be added that they never fail to "elicit the highest admiration of all who have any appreciation of the symmetrical in form or the beautiful in colour." And then the grand bushes of the Mountain Laurel (Kalmia latifolia) were also in the height of their beauty, and being of unusually large size they were most attractive from their masses of bloom. The visitor detected differences in the foliage and in the flowers; the leaves vary in form and size, the flowers in depth of tint, and particularly so in the buds, as some of them approach scarlet in their brilliancy. Unhappily, they did not escape the scathing influence of the May frost, which was severely felt at Bearwood; and near the ground-line, many of the tips of the young growths were sadly injured. Kalmias do so well at Bearwood because the position is high and dry, and like the Rhododendron they do well in the natural soil of the place. It is sometimes said that the best situation for the Kalmia is one fully exposed to the sun, but at Bearwood many of the finest examples are in partial and even considerable shade, and yet they flower plentifully. Whoever devised and planted the kept grounds of Bearwood in the first instance, no doubt knew something of the requirements of American plants, and particularly of the Rhododendron, Kalmia and American Azalea. They were planted with forethought, and therein lies one main cause of their highly successful appearance. The American Azaleas were over, and they had afforded a great floral spectacle during the past weeks. Many of the fine hybrid Rhododendrons which have been so judiciously planted on the verges of the immense clumps of R. ponticum and its varieties, had yet to expand some of their trusses, though some were in full bloom, and they supplied charming and most attractive patches of colour, and were very effective.

The specimen Coniferæ are so fine—tall, spreading, and in the most robust health, that one contemplates these giant exotics with something like awe. It seems difficult to realise that these gigantic ornamental Conifers could do better in their native habitats. The American Oaks, with their ample leafage, which in different varieties affords so much diversity of character, are superb; stupendous Beech, the giants of the arboreal fraternity, stand up tall and strong against the everlasting sky, and probably stood there when the domain of Bearwood formed a part of Windsor Great Forest.

Mr. Tegg deserves the highest credit for the admirable manner in which the grounds are kept. The visitor can walk along miles of pathway and not see a single weed; and the sward is so well kept, that scarcely a leaf could be seen lying upon its surface. The absence of weeds in the paths is due to the fact that if one puts in appearance, it is at once pulled up; salt or other weed-killers are never employed.

In addition to the kept grounds, huge bushes of Rhododendrons a-glow with colour in the season are seen in some wild places, but they also are kept with scrupulous care. One charm attaching to Bearwood is, that the kept grounds fall away almost imperceptibly into semi-wildness; and this again to Pine plantation and woodland, until the whole mingles with rich pasture and waving cornfields.

The Fruit and Plant-houses and the kitchen garden reflect the order, neatness, and excellent condition found elsewhere. Perhaps never before did Peach and Nectarine on walls at Bearwood show finer crops or better growth than were seen this season. Pears, Plums, and Cherries were equally good. Standard and bush trees in the open, and bush fruits were carrying excellent crops generally. The Strawberry plantations suffered severely from the May frost at the cost of a considerable loss of crop. Before such visitations the most painstaking and intelligent gardener is powerless.

It is worth a journey of miles to see the trees of Royal George Peach and Elruge Nectarine, each of which fills a spacious house. The condition of the trees is perfect, the crops of fruit large, and the individuals very fine.

Mention should also be made of the drive from Bearwood through the village of Arborfield to the elevated ridges from which one looks down upon the open valley stretching away almost to Aldershot and Farnham, and through leafy lanes until the descent is made through the lengthened avenue of Sequoia gigantea which opens on to the grounds of Wellington College. The probability entertained by Mr. Douglas, the discoverer and describer of this gigantic Conifer, that it would prove hardy enough for our climate, is

amply proved on the sandy soil which abounds in this portion of Berkshire. Every specimen seems perfect, symmetrical, and healthy. In years to come arboriculturists will visit this avenue, and they will rightly appreciate the public spirit of Mr. John Walter, who planted these long lines of stately plants—"living columns built by the hand of Nature," destined in the years to come to work "silently it may be through centuries of time, and dwarfing by their prodigious bulk and altitude the grandest pillar ever raised by man." *R. D.*

Obituary.

William Hugh Gower.—We greatly regret to hear of the death, on July 30, of this gentleman, in his fifty-ninth year. Mr. Gower has been long known and respected in the horticultural trade, and of late years in the horticultural press also. We await further particulars of his career.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

0, Scotland, N. *Principal Wheat-producing Districts*—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. *Principal Grazing, &c., Districts*—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; *Channel Islands.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending July 28, is furnished from the Meteorological Office:—

"The *weather* was generally fair and warm over Scotland and the extreme northern parts of England and Ireland, but continued rainy and unsettled elsewhere until the closing part of the week, when it gradually improved. Thunder and lightning were experienced from time to time in nearly all districts.

"The *temperature* was above the mean in 'Scotland and England, N. and N.E.,' and in 'Ireland, N.,' but either just equalled, or was a trifle below the normal elsewhere. The highest of the maxima were recorded on the 28th, when they ranged from 79° in 'Scotland, N. and the Midland Counties,' to 71° in 'Ireland, S. and the Channel Islands.' The lowest of the minima were recorded on rather irregular dates, and ranged from 41° in 'Scotland, W. and Ireland, N.,' to 51° in 'England, N.E.,' and to 53° in the 'Channel Islands.'

"The *rainfall* was considerably less than the mean in 'Scotland.' and rather less in 'England, N.E. and Ireland, N.;' in all other districts there was an excess, that in the extreme south and south-west being very large. The fall experienced at some of the south-western stations on the 24th was exceedingly heavy; at Stoke Bishop, near Bristol, 3·22 inches fell between noon and midnight.

"The *bright sunshine* was more prevalent than during the preceding week, and exceeded the mean in 'Scotland, N. and W.' and over Ireland. In most other districts, however, there was again a considerable deficit. The percentage of the possible duration ranged from 59 in 'Scotland, N.,' and 52 in 'Ireland, N.,' to 24 in the 'Midland Counties and the Channel Islands,' and to 22 in 'England, S.W.'"

MARKETS.

COVENT GARDEN, August 2.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. Ed.]

Potatos.

Potato market firm. Prices vary from 3*s.* to 6*s.* per cwt. Old Potatos finished.

SEEDS.

London: *August* 1.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that to-day's market was again scantily attended, with but little business passing. For new French and English Trifolium there is more enquiry at the low prices now prevailing. Samples of this season's home-grown Rape and Rye are now showing at moderate prices. In Mustard there is no alteration. Birdseeds show no quotable variation. Other articles at this quiet season offer no subject for comment.

FRUITS AND VEGETABLES.

Borough and Spitalfields: *July* 31.—Quotations:—Cabbages, 1*s.* 8*d.* to 2*s.* per tally; Carrots, 1*s.* 6*d.* to 2*s.* 8*d.*; Turnips, 1*s.* 6*d.* to 2*s.*; Parsley, 1*s.* 8*d.* to 2*s.* per dozen bunches; Onions, Egyptian, 3*s.* 6*d.* to 4*s.* 6*d.* per cwt.

Stratford: *July* 31.—The supply to this market during the past week has been good, and, with a large attendance of buyers, a brisk trade has been done at the undermentioned quotations:—Cabbages, 1*s.* to 3*s.* per tally; Cauliflowers, 1*s.* 6*d.* to 3*s.* per dozen; Cherries, 3*s.* to 5*s.* per half-sieve; black Currants, 3*s.* to 4*s.* do.; red Currants, 2*s.* 6*d.* to 3*s.* 6*d.* do.; Plums, 2*s.* to 3*s.* do.; Green Peas, 3*s.* to 4*s.* 6*d* per bag; Broad Beans, 2*s.* 6*d.* to 5*s.* do; Carrots, 1*s.* 9*d.* to 2*s.* 3*d.* per dozen bunches; Turnips, 1*s.* to 2*s.* do.; do., 40*s.* to 60*s.* per ton; Carrots, household, 45*s.* to 50*s.* do.; Mangels, 22*s.* to 25*s.* do.; Onions, Egyptian, 80*s.* to 110*s.*; Apples, English, 4*s.* per bushel; Pears, English, 2*s.* 6*d.* to 5*s.* do.

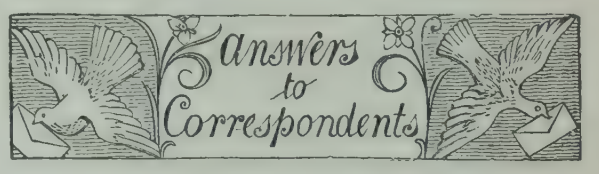
Farringdon: *August* 1.—Quotations:—Marrows, 5*s.* to 6*s.* per tally; Peas, 2*s.* to 2*s.* 6*d.* per bushel; do., 3*s.* 6*d.* to 5*s.* per sack; Cabbages, best, 4*s.* to 5*s.*; seconds, 2*s.* to 3*s.* per tally; Broad Beans, 2*s.* to 3*s.* per bag; Carrots, 1*s.* 6*d.* to 2*s.* do.; Turnips, 1*s.* 6*d.* to 2*s.* 6*d.* per dozen bunches; Spring Onions (Lisbon), 2*s.* to 2*s.* 6*d.* do; Apples, Lord Suffield, 3*s.* to 3*s.* 3*d.* per half-sieve; Plums, Rivers' Early, 4*s.*, to 4*s.* 6*d.* do.; Currants, Black, 3*s.* to 3*s.* 6*d.* do.; Red, do., 2*s.* to 3*s.* do.; Gooseberries, 2*s.* to 3*s.* do.

POTATOS.

Borough and Spitalfields: *July* 31.—Quotations ranged from 85*s.* to 100*s.* per ton.

Stratford: *July* 31.—Quotations:—Early Rose, 60*s.* to 70*s.*; Myatts, 60*s.* to 80*s.*; Snowdrops, 80*s* to 90*s.*; White Hebrons, 70*s.* to 80*s.*; Sutton's Early Regents, 70*s.* to 80*s.*; per ton.

Farringdon: *August* 2.—Quotations:—Essex Regents (Sutton's), 70*s.* to 75*s.*; do., Kidneys, £4 to £4 10*s.*; Hebrons, 70*s.* to 75*s.*; Snowdrops, 70*s.* to 80*s.* per ton.



London Averages: *August* 1.—English Kidneys, 80*s.* to 100*s.*; Hebrons, 70*s.* to 90*s.*; Snowdrops, 80*s.* to 100*s.*; Rounds, 60*s.* to 80*s.* per ton.

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 110*s.* to 138*s.*; do., inferior, 80*s.* to 120*s.*; do., new, 75*s.* to 98*s.*; hay, best, 100*s.* to 130*s.*; do., specially picked, 138*s.*; inferior, 60*s.* to 100*s.*; new, 70*s.* to 90*s.*; Mixture, 90*s.* to 127*s.* 6*d.*; and Straw, 43*s.* to 63*s.* per load.

CORN.

Averages.—Official statement of the average prices of British Corn, imperial measure (qr.), for the week ending July 28, and for the corresponding period last year:—1894: Wheat, 24*s.* 8*d.*; Barley, 22*s.* 5*d.*; Oats, 20*s.* 5*d.* 1893: Wheat, 26*s.* 5*d.*; Barley, 23*s.* 1*d.*; Oats, 21*s.* 7*d.*

*** *Owing to the large increase in our circulation, we are reluctantly under the necessity of going to press some hours earlier. Our contributors, who well know what this implies, will kindly aid us by sending their communications as early in the week as possible. Communications should reach us not later than Wednesday.*

Botanical Questions: *L. r. d. B.* Statice profusa is stated to be a hybrid between S. puberula and S. Halfordi, the latter being a form of S. macrophylla. Malouetia asiatica of Siebold and Zuccarini is a synonym of Trachelospermum jasminoides, Benth. et Hook. Other synonyms are Nerium divaricatum of Thunberg; Parechites Thunbergii, Gray; Acmena ovata is unknown to us.

Chrysanthemum: *Cello.* A fungus, about which we will tell you more another time; meanwhile, burn the affected plants.

Dipladenia Seedling: *F. H.* A pretty variety of D. amabile, worth perpetuating.

Disqualification of a Tray of Vegetables: *W. J.* The judges in our opinion were right in their decision under the circumstances.

Grape Appley Towers: *W. Gray.* It has a medium-sized bunch, tapering, and slightly shouldered. It is an excellent variety, setting freely, and possessing a good constitution. It is a tough, thick-skinned Grape, with a rich, strong flavour.

Insects: *G. A.* Aphis Loniceræ and A. xylostei (Honeysuckle), Aphis aceris (Sycamore), and Chermes fagi (Beech).

Names of Plants: *D. & M.* No leaves and flowers; shrivelled beyond recognition.—*E. M.* Lathyrus cyaneus.—*W. J. D.* Argemone mexicana, common weed, belonging to the Poppy family.—*H. M. E.* 1, Stachys betonica; 2, Hypericum hirsutum; 3, Campanula Trachelium.—*G. W.* 1, Zenobia speciosa; 2, Spiræa media; 3, Clematis viticella; 4, Linaria vulgaris; 5, Photinia serrulata; 6, Dictamnus Fraxinella.—*C. J. G.* sends more than we undertake to name. 1, Erigeron canadense, naturalised; 2. Galinsoga parviflora, naturalised near Kew; 3, Crepis biennis; 4, Carduus acanthoides; 5, Carduus arvensis; 6, Chenopodium album; 7, Polygonum lapathifolium; 8, Cerastium vulgatum.—*S. P. D.* 1, Begonia Marshalli, one of the first of the Rex class; 2, Campanula isophylla; 3, Lilium bulbiferum; 4, Hoya carnosa; 5, Francoa sonchifolia; 6, Veronica spicata.—*A. B., Hants.* 1. Geranium ibericum; 2, Geranium silvaticum; 3, Thalictrum flexuosum.—*C. H.* 1, Spiræa ariæfolia; 2, S. Lindleyana; 3, S. callosa; 4, Rubus odoratus; 5, Hippophae rhamnoides; 6, Cornus sanguinea fol. var.—*J. Gibbs.* The leaf is that of Bryophyllum calycinum. If you peg one down on to the surface of the soil in your greenhouse, and keep it moist, by covering it with a bell-glass, you will shortly see little buds sprouting from the margins.—*E. O. W.* Lythrum Salicaria. —*A. A.* Bromus secalinus. A weed introduced with imported seed.—*L. M. B.* Sends one shilling for the Gardeners' Orphan Fund, for which we thank him. *L. M. B.* is evidently a man of well-regulated mind. He thinks of the orphans, and he sends his specimens properly packed and labelled so as to give as little trouble and facilitate our labours as much as possible. 1, Fern Pteris argyrea; 2, Campanula persicifolia, double white variety; 3, Cheiranthus ochroleucus; 4, not recognised; 5, Achillea Ptarmica double fl.—*A. S., Sydenham.* Calceolaria pinnata.—*T. D.* 1. is probably Anemia collina, we cannot be sure by only seeing the barren frond. If it sends up a fertile portion like Osmunda, it is, as we have stated, Anemia; 2, Nothochlæna trichomanoides; 3, Cheilanthes viscosa. Five or six flowers is the most we have seen on one inflorescence of Cattleya Rex. The others you mention are very fine examples.—*T. L. B.* Epidendrum Candollei.—*P. C. H.* 1, Jasminum revolutum; 2, Spiræa callosa; 3, Campanula Portenschlagiana; 4, Veronica spicata (variegated form); 5, Escallonia macrantha; 6 Cotoneaster Simonsi; 7, Campanula sp.—*E. G. Chapple.* Hypericum calycinum.—*W. H. D.* Sobolewskia clavata.

New Tomato: *W. C.* The fruits are handsome in shape and colour, and of nice flavour; but whether they are better than others we have no means of judging.

Rosa laxa (?): *J. W. Wilson.* Please send shoot with good ripe fruit. Specimens sent insufficient.

Royal Horticultural Society's Examinations in Horticulture: *W. H. A.* You should write to the Secretary of the Society, 117, Victoria Street, Westminster, who will furnish you with the date of the next examination (1895). You will then be better able to judge what are the books you are likely to need the most. We admire your determination to stick to the business. Write again.

Solanum losing their Blooms: *J. F.* As your plants are in a cool-house, we should premise that they stand a good distance from the glass, and that the temperature has hitherto been too low for them to do well; or you may have afforded them too much water, causing a loss of roots, or at any rate, of vigour. In a warm sunny summer, like that of last year, berried Solanums succeed out-of-doors, but in the present one the plants should have a little artificial warmth and as much sunlight as can be afforded them; in fact, treating them like Tomatos or Capsicums, and not forgetting a proper amount of ventilation.

Strawberries: *G. M.* No. 3, Dr. Hogg; 1 and 2 unrecognisable.

St. Stephen's Green, Dublin.—Messrs. Pulham & Son, 50, Finsbury Square, write that the rock-work waterfall, rocks to island and lake, &c., were all executed by them for the present Lord Ardilaun.

Sulphate of Iron: *C. B.* This is another name for green vitriol, copperas, &c., and is a compound of sulphuric acid and protoxide of iron; consisting of 26·10 of protoxide, 29·90 of acid, and 44·00 of water in 100 parts. Commercial sulphate of iron is made in a cheaper way. You may buy the finished product at an oilman's at a cheap rate.

Tomatos Diseased: *W. C. & S.* The leaves are infested with a fungus, a Peronospora allied to and similar to the Potato fungus, against which you might use with good effect a mild form of the Bordeaux Mixture, a formula for making which was given in a recent issue of the *Gardeners' Chronicle.* Cut off and burn at once affected foliage, and keep the house warmer and dryer, using also sulphur on the hot-water pipes.

Tomato Fly: *W. C. & S.*—The white fly, Aleyrodes vaporarium, it is almost impossible to get rid of. Some of the fumigation or vaporising materials now sold might destroy it.

White (Auvergne) Frontignan Grape: *C. W. H.* The cracking may be avoided by not shutting up the vinery when the fruit is full grown with too much humidity in the air, and by not affording large quantities of water at the root whilst the crop hangs on the Vine. Some varieties, like Madresfield Court Muscat, will not keep long on the Vines after being ripe from this cause, and must be consumed, or cut and put into bottles.

Winter Dressing for Vines Infested with Mealy-Bug: *An Ignoramus.* The surest remedy for this evil is to root out the Vines, and paint walls and every part of the house twice over with petroleum, and afterwards with white lead paint, to clear out the old borders and make new ones, planting them with young clean Vines. But when it is not desirable to do the work thus radically, the cleaning of the Vines from mealy-bug will be a work of several years. In the first place, the Vines should have the older bark peeled closely, afterwards thoroughly brushing them over twice with soft-soap and water, with a small quantity of carbolic soap and petroleum added, and finally painting the Vines with the following mixture:—To 3 gallons of water add half a pint of gas-tar, 6 lb. of flowers-of-sulphur, with some clay to give it body, brushing this into every part of the stems with a stiff brush. The upper crust of the soil of the inside border should be shovelled out of the vinery, and new soil put in its place; moreover, every bit of the structure should be washed with petroleum. Thrips may be kept in check by fumigation, practised early in the season two or three times, with four-day intervals, and fumigating the vinery twice before starting the Vines. *Bailey Wadds.*

CONTINUED INCREASE in the CIRCULATION OF THE "GARDENERS' CHRONICLE."

Important to Advertisers.—*The Publisher has the satisfaction of announcing that the circulation of the "Gardeners Chronicle" has, since the reduction in the price of the paper,*

Increased to the extent of 80 per cent., and is increasing weekly.

Advertisers are reminded that the "Chronicle" circulates among country gentlemen, and all classes of gardeners and garden-lovers *at home, that it has a specially large* foreign and colonial circulation, *and that it is preserved for reference in all the principal Libraries.*

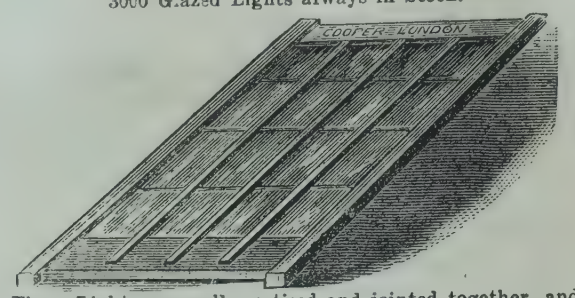
SPECIAL OFFER.

MARÉCHAL NIELS and GRAPE VINES, any variety, in 5-in. pots, from 2 ft. to 3 ft. long, before potting into very large pots, to complete this season's growth, will make 9 ft. to 12 ft. canes in either hot or cold houses during the season, and will bear flower and fruit respectively next year. 1*s.* 3*d.* each; 3 for 3*s.* 6*d.*; 6 for 6*s.* 6*d.*; 12 for 12*s.* Extra large plants from 4 to 5 ft. long, in large pots, 2*s.* 3*d.* each; 3 for 6*s.* 3*d.*

IMPORTANT NOTICE.

If Cooper's Greenhouses are not the Cheapest and Best, how is it they sell more houses in one month than all the other makers put together sell in one year?



Do not be misled by other people advertising houses at the same price as ours, as it is impossible for them to give such good value. Call at works and see the houses being made and the materials we use. We have only one establishment in the Old Kent Road, 747 to 755, on the left-hand side from City. Do not be misled by little ladder-makers and small house-decorators, styling themselves Horticultural Providers, and in some cases have no name up. Competition courted. Imposition hatred.

NOTICE TO OUR CUSTOMERS.

In answer to numerous inquiries, we regret to say no ordinary shares were offered to the public, the Directors taking the whole of them. A limited number of Preference Shares, which carry interest at £3 per cent., and are preferred as to capital, are available for issue. For terms of issue, apply to the Directors.

GARDEN LIGHTS.

3000 Glazed Lights always in Stock.

These Lights are well mortised and jointed together, and made in a good workmanlike manner, and are well worthy of inspection. Framework made of 2 in. by 2 in. styles, and properly rabbetted for the glass, with good 2 in. sashbars. The Glazed Lights are nailed and bedded in good oiled putty.

RICHARDSON'S
PATENT
HOODED TUBULAR BOILERS

Awarded **Silver Medal** for Boilers and Heating Apparatus at the International Horticultural Exhibition, London.

Have combined in one the advantages of the two best forms of Boilers hitherto made—the plain Saddle and Tubular Saddle.

They Heat more than Twice the Quantity of Piping that can be heated by the ordinary Saddle with an equal amount of fuel. They are durable, quick-heating, easily set, and easy to manage. PRICE LIST from the patentees,

W. RICHARDSON & CO.,
Horticultural Builders and Hot-water Engineers,
DARLINGTON.

ROBERT WARNER & CO.'S
WINDMILLS.

Saves Coal, Pumps Water, Grinds Corn, Cuts Chaff, &c.

Supports can be made in Teak, Iron, or Steel, for Hot Climates.

Two of Robert Warner & Co.'s Improved Windmills were erected at the Royal Agricultural Show, Cambridge.

Prices from £16 16s., including Pump and Timber Supports.

May 27, 1893, The Dell, Englefield Green, Surrey.

ROBERT WARNER & Co., Engineers, 27, Jewin Crescent, E.C.

Dear Sirs,—It affords me much pleasure to inform you the 25 ft. Annular Sail Windmill, on 40 feet timbers, working a set of 3 in. × 9 in. stroke treble pumps, that you fixed here for Baron Schröder, is giving very great satisfaction, pumping the water through 4,224 feet of pipe, to a vertical height of about 80 feet. I must also express my thorough appreciation of the manner in which the whole of the work has been so successfully carried out.—Yours faithfully,

H. BALLANTINE, Head Gardener to Baron Schröder.

We have just made and erected a similar Mill and set of Pumps for Lord Northbourne.

ESTATE SALES.

The Best County Medium for Advertising Sales of Estates is

THE "WORCESTER HERALD,"

ESTABLISHED 1794,

The Leading County Paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to forward for reference and distribution plans and particulars of Estates, Catalogues of Machinery, Furniture, Books, and other property advertised in the columns of the "HERALD."

Sales of Stock and Agricultural Effects.

The "WORCESTER HERALD" is the most effective organ for giving publicity to announcements of this class. It is the leading Agricultural Paper in the County, and Circulates most extensively among Agriculturists in and around Worcestershire.

Farms to Let.

Land Agents, Estate Managers, and all having Farms to Let, would do well to advertise in the "WORCESTER HERALD," the leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large circulation. Moderate charge.

Situations Vacant and Wanted.

For producing results the "WORCESTER HERALD" is recognised as a specially good medium. Cheap Rates.

A., 30, Throgmorton Street, E.C.

THE GOOD DIE YOUNG. — Unlike most popular sayings, this has very little truth in it. Experience every day proves that some at least of the good are spared to make the world brighter and better, and a more pleasant place to live in. In fact, our experience is that good people, and good things generally, live the longest. For example, consider the thousands of articles which have been widely advertised and are now forgotten. Why? Because they were bad. On the other hand, we have HOLLOWAY'S PILLS and OINTMENT, which have proved the faithful friend of poor humanity for fifty years and more. Why? Because they are good. Of a truth, that which is good does not die, but lives for all time.

All carriage free. Each variety separately named.

DOBBIE AND CO., Florists to the Queen, Rothesay.

SOLANUM CAPSICASTRUM

"CLOTH OF GOLD."

The entire Stock, from a start of one plant, which originated from seed at HARTLAND'S, Ard Cairn, Cork, is offered for Sale to the highest bidder. The leaves are the colour of GOLDEN ELDER, and the berries bright orange-scarlet.

The plant, in habit, GUARANTEED equal to the finest form seen in Covent Garden, but with this difference, that the foliage as stated is golden. It also comes more golden from seed. This I have only tested this season. At night the plants are scarlet and gold.

I, THE undersigned, CHARLES EASTWOOD, of Bloomer Gate, Mytholmroyd, in the parish of Halifax, Nurseryman and Landscape Gardener, HEREBY GIVE NOTICE that the business of a Nurseryman and Florist, lately carried on by me at Lane House, Luddenden, in the said parish, has been taken over by my son, THOMAS EASTWOOD, of Lane House aforesaid, who will carry on the said business of a Nurseryman and Florist, in his own name, and on his own account from the date hereof. All debts due and owing up to the date hereof will be paid and received by me. The business of a Nurseryman, Florist and Landscape Gardener will still be carried on by me at Bloomer Gate, Mytholmroyd, aforesaid.
Dated this 1st day of August, 1894. CHAS. EASTWOOD.
Witness, John Wormald, Riding Head, Luddenden.

FOR ORCHIDS and GARDENERS to Grow them, apply to SANDER'S, St. Albans. The finest stock of Orchids in the World.—30 minutes from St. Pancras.

HUGH LOW AND CO., Clapton Nursery, N.E.

LATE STRAWBERRIES.
Let us sing to the praises of three late Strawberries.

FROGMORE LATE PINE, which is absolutely the flavour of Ripley Queen Pineapple, sturdy in growth, large in size, and an abundant cropper. 7*s.* 6*d.* per 100.

OXONIAN, true, not Eleanor, which it is generally supplied for. It is simply an enormous cropper, rather sharp in taste, and the latest Strawberry on record. 5*s.* per 100.

Now comes lastly, but not leastly, that good old public servant, ELTON LATE PINE, warranted true; no other Strawberry like it for preserving.

All the New Strawberries supplied, all warranted true, and the best plants in the trade.
R. GILBERT, Burghley, Stamford.

To the Trade.

MESSENGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus,

Will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses. Illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kinds of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. **Price, 2s. post-free.**

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country; an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made, and gentlemen waited on in any part of the country. Plans and Estimates free on application.

WORDSLEY, STOURBRIDGE.

CHRYSANTHEMUMS.

All Gardeners who hope to have really fine blooms this autumn will now be beginning to feed their plants. The best of all Manures for this purpose is "PEARSON'S CHEMICAL," as it is a perfect plant food, has no offensive odour, and is always perfectly identical in composition, so that its use once learned there is no further risk or trouble in applying. Some of the finest exhibition blooms shown in the Midlands have been grown by its aid alone, without any other fertiliser. In wet weather a teaspoonful to each plant may be sprinkled on the surface of the soil, but we ourselves prefer to use it as a liquid, our method being to dissolve a 6-inch potful in a 36-gal. tub, this being afterwards used at the rate of 2 gals. in each water-barrow (25 gals.). Gardeners are cordially invited to call and see our plants, and judge of the effect for themselves. Price and all information free on application.

STRAWBERRIES

LAXTON'S "ROYAL SOVEREIGN."

An earlier higher quality and Improved Sir J. Paxton

Three Medals and Five First-class Certificates awarded.

All must have the finest early Strawberry yet introduced. Fruit of the largest size, brighest glossy scarlet colour, flavour rich (quite equal to British Queen), ripens with Noble; a splendid cropper and grower, and we consider it to be the long-sought EARLY HIGH-FLAVOURED AND IMPROVED SIR J. PAXTON, a splendid forcer, and in every way worthy of its name. Handsome coloured plate, now ready, 6d. (gratis to customers).

12s. per doz., £3 per 100; in pots, 18s. per doz., £4 per 100.

LAXTON'S SENSATION.

First-class Certificate Gardening and Forestry Exhibition, May 10, 1893.

An enormous second early variety of good flavour, and probably the largest Strawberry ever introduced. A remarkably strong grower, and producing fruit in wonderful clusters. Will prove a welcome addition to the list of good sorts. Forces splendidly.

20s. per 100, 4s. per doz.; in pots, 30s. per 100, 6s. per doz.

LAXTON'S SCARLET QUEEN.

(First-class Certificate.)

The best first early—very early. Fine colour and shape, and the richest flavour. Habit strong, a very prolific variety, a splendid early table and market fruit.

10s per 100, 3s. per doz.; in pots, 18s. per 100, 4s per doz.

LAXTON'S LATEST OF ALL.

The best late Strawberry, and the largest and best late variety. A seedling from British Queen, but much later. Flavour grand.

8s. per 100, 2s. per doz.; in pots, 16s. per 100, 3s. per doz.

The following best varieties for forcing or early planting can be supplied STRONG in pots at once:—

	Per 100.		Per 100.
A. F. Barron	15s.	King of Earlies	15s.
Nicaise	15s.	Grosse Sucrée	16s.
British Queen	15s.	Latest of All	16s.
Dr. Hogg	16s.	Noble	16s.
Jas. Veitch	15s.	President...	15s.
Ruskin	16s.	Napier	15s.
Commander	16s.	Paxton	15s.
Competitor	16s.	Viscountess	15s.
Keen's Seedling	15s.	Waterloo...	16s.

Also, strong Open Ground Runners can now be supplied at usual prices, of—

Nicaise, Sucrée, Vicomtesse, British Queen, Paxton, President, Albert, Captain, King of Earlies, Marguerite, Dr. Morère, Dr. Hogg, Stirling Castle, Sharpless, A. F. Barron, Waterloo, Countess, Jas. Veitch, Unser Fritz, Eltou Pine, Lucas, Filbert Pine, and all other best sorts. English and Foreign (about 200 varieties in stock). Full LIST on application to—

LAXTON BROTHERS, BEDFORD.

THE

Gardeners' Chronicle.

SATURDAY, AUGUST 11, 1894.

THE FRUIT CROPS.

IN our last issue we gave a synopsis of the very numerous reports as to the condition of the fruit crops we had received from all parts of Great Britain and Ireland. The results in the main were singularly uniform. The hot dry summer of last year had ripened the wood, and there was every promise of a most abundant crop of all kinds, when those hopes were dashed by the severe frost of May 20. The tabular matter already published does not allow of much detail being given, and the great degree of uniformity in the fuller reports we have received from the kindness of our correspondents relieves us of the necessity of publishing more than a small selection from them.

0. SCOTLAND, N.

MORAYSHIRE.—Fruit crops of all sorts in this neighbourhood are looking most promising, with the exception of Strawberries, which got badly frosted on the 21st of May. Apricots, Peaches, and Pears set almost every blossom, and have had to be severely thinned. Plums and Apples, although they looked well when in blossom, have only an average set. With the heavy rains we have experienced recently, the fruits are swelling fast, and the foliage is clean and healthy. *C. Webster, Gordon Castle.*

—— It is doubtful if the Pears and Apples will have the same size and finish as last year. There has been plenty of moisture, both for root and foliage; but last year showed that sun-heat was of more importance, in this part, for fine fruit-growing than root-moisture. *Wm. Ogg, The Gardens, Duffus House, Elgin, N.B.*

NAIRN.—Apples have but a sprinkling of fruit, and even Denyer's Victoria Plum, so prolific generally, is almost a failure; Gooseberries are an extra fine crop and larger than usual; Raspberries very good; Strawberries small, the frost on the 20th of May having nipped the leaves; and Currants are but half a crop, the black varieties plentiful. Pears on walls have had to be thinned. *James Maitland, Cawdor Castle.*

SUTHERLANDSHIRE.—Fruit crops are generally hereabouts over the average, and Apples and Gooseberries especially bear unusually heavy crops. The gardens at Dunrobin Castle being near the sea coast suffered little damage from spring frosts—although the outlook during the period of frost and the cold winds at the beginning and middle of May was by no means bright. The temperature was not below 32° during May in the screen thermometer stand, and crops have turned out altogether much better than we expected. *D. Melville, Dunrobin Castle Gardens.*

1. SCOTLAND, E.

ABERDEEN.—Plums, Pears, and Cherries blossomed early, and were set and swelling their fruit before the frosts we had in the end of May set in, and escaped with but little injury, also Gooseberries; on the contrary, the Apples, which, were in full blossom, suffered severely, and the crop is almost a failure; Black and Red Currants also suffered from frost and are a very poor crop; Strawberries were not in flower, so they escaped harm. *John Forrest, Haddo House Gardens.*

Banffshire.—The fruit crop is not up to my expectations, although the early spring months were favourable and there was a grand appearance of blossoms, but the late frost that we had greatly reduced the Apple crop. Pears on walls being earlier than usual were set and so far escaped the frosts; Standard Bergamots and Hessle are also good. Plums to a great extent are a failure. Peaches set most abundantly, also Apricots, but set rather irregularly; we have a fair crop of Figs on trees on the open wall. Small fruits in general are a good average crop; early Strawberries suffered a little by the frost, as did also Black Currants; Strawberries are now suffering very much by the wet weather. *J. Fraser Smith, Cullen House Gardens.*

Berwickshire.—The winter-like weather we had here from May 20th to 24th inclusive, when we had an aggregate of 31° of frost in all, destroyed the blooms of Strawberries, Gooseberries, and Currants. The Apple-blossom was abundant and strong, yet the result will be the poorest on record. The Pears being earlier in bloom suffered less, and the crop is a good one. *John Cairns, The Hirsel Gardens, Coldstream, N.B.*

—— Apple-trees were a mass of blossom, but scarcely a fruit is now to be seen, except a few on the walls. Pears are an average crop. Plums, of the Victoria variety, a heavy crop, most of the other kinds a failure. Cherries are a fair crop, but many of the fruits are split and deformed. Peaches, Nectarines, and Apricots are still a heavy crop, although two-thirds of the crop was taken off, and the quality promises to be good. Small fruits vary a good deal, but all are very good in quality. Raspberries are a poor crop, and of bad quality. Strawberries under the average, except Garibaldi. The two last-named fruits usually do very well here. Nuts never do well, and this year are a complete failure. *J. Ironside, Blackadder Gardens, Edrom.*

East Lothian.—The frosts at the end of May did a great amount of damage, Apples and Strawberries suffering most, Gooseberries and other small fruits being badly hit. Apricots, Pears and Peaches may be said to be *the* fruit of the year. The foliage and general appearance of trees is all that can be desired. *R. P. Brotherston, Tyninghame.*

—— After one of the most promising prospects I ever saw, the frost we had in the last week in May did great damage to nearly all kinds, and to Apples more especially. Pears have still a good crop, both on wall trees and standards. Plums are very scarce. Peaches, Nectarines and Apricots are excellent crops, and will be fine if we only get a favourable ripening season. All our first blossoms of Strawberries were killed, consequently we have a poorer crop. All the other small fruits suffered too, except Raspberries, which were not in flower, and we have a good crop of these. *Z. Dow, Newbyth Gardens.*

—— Although everything is about a month later as compared with last year, our crops are quite as good, with the exception of Apples, which suffered severely from the sharp frosts in May. Some of our young Apple trees are carrying a few nice fruits in sheltered places. *Wm. McKelvie, Broxmouth Park, Dunbar.*

Fifeshire.—The blossom on all fruit trees was unusually good, and those of the wall fruits set well, but dropping has resulted in the majority of stone-fruits just at the stoning period, while Apples and Pears dropped immediately after setting. Gooseberries promised an extraordinary crop, but the late frost ruined them, and now they are only average. The same applies to Red Currants and Raspberries; Black Currants are almost nil. Strawberries while in blossom (which was after the frost of May 21st), promised an enormous yield, but evidently the check from the frost of above date was too much for them, as they eventually mildewed, and are scarce. *John Proctor, Donibristle Gardens, Inverkeithing.*

—— Three nights in succession of 4°, 5°, 6°, played havoc with the Apple blossom, rendering the crop almost nil on standard and bush-trees, while Gooseberries and Currants were reduced to less than half a crop. The wall-fruit that was set received a check only, and is now healthy and growing freely. Except a few early patches that were in bloom, the Strawberry crop suffered very little, and is plentiful and good. *Wm. Williamson, Tarvit, Cupar.*

Forfarshire.—The severe frost we had on 20th May, and for several days after, made havoc, even the foliage and many of the fruiting spurs being killed outright. Plums and Cherries were set some time before the frost, and these trees being all on walls have good crops. Gooseberries, Black and Red Currants, although set and swelling, shed a good deal of fruit, especially the first two. Early Strawberries just coming into flower here at that time had the first and best blooms destroyed, and now the fruit is rotting with the continued rain. We gathered the first a fortnight later than last year. *W. McDowall, Brechin Castle.*

Kincardineshire.—Our standard Apple trees had an immense quantity of bloom, but the continuous wet weather rotted nearly the whole of it, hence the crop is poor. Black Currants were nearly all destroyed by the 7° frost experienced on May 22nd. *J. M. Gairns, Arbuthnot Gardens, Fordoun.*

Mid-Lothian.—Here we had 7° of frost on May 21st, and 6° on the two following mornings, followed by bright sunshine, which caused great damage to the newly set apples, and killed all the early flowers on the Strawberries. Still, the effects were very partial, places suffering badly adjoining others in which very little harm was done; and, excepting the Apples and small fruits generally, the crop of fruit is fully an average in quantity, and decidedly above average in quality. Among Apples, the Codlin section has suffered the worst—Lord Suffield, Keswick Codlin, Manx Codlin, and such like, being almost fruitless, Lord Grosvenor proving an exception with a fine crop. Most of the other standard varieties, especially on dwarf trees, are bearing moderate crops; and many of the newer varieties are also bearing well, especially Worcester Pearmain, Lane's Prince Albert, The Queen, Bismarck, Sandringham, Maltster, Baumann's Red Reinette, and many others, including Lady Sudeley, which for the first time is bearing well. Pears are the crop of the season, and are generally a heavy crop of very fine fruit. All the standard varieties are bearing well,—Louise Bonne of Jersey, Marie Louise, Doyenné du Comice, Beurré d'Aremberg, Hacon's Incomparable, Jargonelle, Williams' Bon Chrétien, Easter Beurré, and Catillac, being most conspicuous. Plums are a good average, and the same may be said of Cherries. Peaches and Nectarines on open walls are finer than they have been since the "Seventies." Apricots are also a splendid crop, quite equal in quantity and superior in quality to last season's crop, one of the best on record in this locality. Gooseberries and Currants suffered last year from the heat and insects, and in many places the May frost pinched them; still the crop is fair and generally free from insects. Strawberries, as already mentioned, were nipped in May by the frost; but the later flowers have set well, and are giving a good average crop. Nuts of all kinds are thin, but they are not much grown, either in gardens or for market. The season is still late, a month behind last year, which was exceptionally early; and heat with sunshine is required to bring crops to full maturity. Fruit trees of all kinds are making a fine growth, and the foliage is clean and healthy, the dripping weather having kept insects in check, and with a fine autumn the prospects are good for another year. *Malcolm Dunn, Dalkeith Gardens.*

—— On the 20th and 21st of May we registered 7° and 9° of frost, which blighted all hopes, especially the Apples on standards, also Gooseberries and Black Currants which had no shelter, but where sheltered on borders behind north walls they are an average crop yet. Sweet Cherries on north and east walls are heavily cropped, also Morello varieties, May Duke, Governor Wood, Belle Agathe, Bigarreau, Napoleon, Archduke, Black Eagle. Plums on walls, viz., Victoria, Jefferson, Kirke's, Pond's Seedling, Washington, Magnum Bonum, Greengage, also Bradley's Greengage, Coe's Golden Drop, average. Pears, varieties on walls, Brown Beurré, Easter Beurré, La Fortune,* Ambrosia, Louise Bonne of Jersey, Napoleon,* Beurré de Capiaumont,* Saint Germain, Doyenné du Comice, Bon Chrétien, average. Many others. *Niel McDougall, Riccarton Gardens, Currie.*

Perthshire.—The disastrous low temperatures in May have given very opposite results. Pears, such as Jargonelle, Beurré Diel, and a few other hardy varieties, are carrying good average crops, Apples being nearly a failure in most cases. The flowers of small fruits—Strawberries—were just opening during the last week in May, and by being so far retarded in growth are giving fair average crops. Plums on walls a total failure, but standard Victorias as a rule have a full crop. Strawberries are both abundant and of good quality. *George Croucher, Ochtertyre, Crieff.*

Roxburghshire.—The frost of May 20, 21, and 22, completely spoilt what would otherwise have been the most prolific year for all kinds of fruit in the Jedburgh district of Roxburghshire. May Dukes and Morellos promise well. Apricots a very heavy crop, but not swelling, and still dropping off. *J. Page, Monteviot, Jedburgh.*

Selkirk.—The sharp frost we had in May did a lot of damage to Apples on standards, Black Currants, and Strawberries in the early parts of the county. Pears, Plums, Cherries, Apricots, and Peaches being mostly grown on walls, and escaped where protected. *W. G. Pirie, Sunderland Hall Gardens.*

6. SCOTLAND, W.

Ayrshire.—Fruit crops are now anything but satisfactory, Apples and Strawberries being reduced to less than a third of an ordinary crop, although up till the 20th of May a better show of all kinds of outdoor fruits could scarcely have been desired; a succession of five frosty nights with a scorching sun during day played sad havoc at that time. Pears and Apricots are the only two kinds of fruit showing satisfactory crops at the present date. *D. Buchanan, Bargany Gardens, Girvan, N.B.*

—— I find the fruit crops in this district are very variable; some much, and others little damaged by the severe frost we had on the 21st and 22nd of May; very exposed places suffering a good deal more than others that are well sheltered. On the whole the crops are light, but promise to be good. All trees and bushes are very clean and free from aphis, owing, I think, to the very showery weather we have had during the last two months. *A. Wilson, Auchencruive.*

Stirlingshire.—Never were fruit crops of every kind more promising than during the early days of May; but the last week of that month brought severe frost. Several nights the thermometer indicated 4° to 7° below the freezing point. The sun was very powerful early in the morning, and all fruits with exposure to south and east were completely destroyed. Apples such as Seaton House, Stirling Castle, Lord Suffield, and Golden Spire, which have never failed to fruit abundantly for ten years past, have not one-fourth of a crop upon them; although Currants (red and white) suffered somewhat, they are very heavily cropped, whilst Black ditto were severely thinned. Cherries, which promised remarkably, are greatly reduced. President Strawberry is a good crop and first rate in quality. *M. Temple, Carron.*

Wigtonshire.—The Apple crop in this district is the worst known for some years, many of the trees being quite fruitless; whereas Peaches, Nectarines Figs, and Pears have remarkably good crops. Strawberries lost much of the earlier bloom by the frosts in May. Currants, Raspberries, and Gooseberries have abundant crops, and the fruits are of good quality. Fruit trees in general are very healthy. *James Day, Galloway House, Garliestown.*

* Those marked (*) were heavy crops.

2. ENGLAND, N.E.

Wylam-on-Tyne.—Owing to frost in May, fruit crops are very partial in this district. Some gardens near here have excellent crops of Gooseberries and other small fruit, and others none. Pears and Apples are an entire failure. *Jas. Moore, Castle Hill Gardens.*

Hexham.—The show of bloom and the promise of crops in this district of small fruits such as Gooseberries and Currants, also Pears and Apples, was very good, and remained so until Monday, 21st May, when we registered 6° frost; on 22nd 9° frost, and on 23rd 5° frost, blighting all these prospects. It is considered in the northern districts to be one of the most severe late spring frosts experienced during fifty years. *Wm. Fell & Co., Seed Merchants and Nurserymen.*

Northumberland.—Apples promised a full crop up to the frost of May 20th, when it was almost destroyed. There is a crop on many Apple-trees, and on others merely a sprinkling of fruit, but the bulk is gone. Strawberries were much injured by the autumn gale in November, and severe frost during the winter; the frost in May destroyed all the early bloom, still some good fruits are being gathered in late places. Black Currants may be half crop; Raspberries rather more here. Gooseberries are heavily cropped in some places, and in others a failure. *George Harris, Castle Gardens, Alnwick.*

—— Apples are very much under what was expected, but still we have good crops of some varieties, such as Domino, Pott's Seedling, Cellini, Peck's Pleasant, Ecklinville, Warner's King, and The Queen. Pears are but a moderate crop, the cold east winds having destroyed the blossoms. Raspberry Superlative is by far the best variety I have ever grown. *David Inglis, Howick Hall, Lesbury.*

Yorkshire.—In low lying situations all fruits are very scarce, but on more elevated ground there is a good average crop. The following varieties of Apples, viz. King of Pippins, Early Margaret, Lane's Prince Albert, Stirling Castle, Mannington, Adams' and Worcester Pearmain, are carrying heavy crops; and of Pears, Jargonelle, Marie Louise, Beurré de Capiaumont, Louise Bonne of Jersey, and all wall trees are carrying abundant crops. This has been the worst year I can remember for insect pests on fruit trees, both outside and under glass. *J. Riddell, The Gardens, Castle Howard.*

—— The present season's crop of fruit taken all round is one of the worst on record. Apples very few; Pears, a nice crop on walls and on old standard Hessles; none on espaliers. Plums are scarce and the trees much blighted; Dessert Cherries scarce, having suffered from frost, but we have some fruit on standard May Dukes and on Morellos on the north wall; Peaches and Nectarines are looking well, having had during the period of severe frost the protection of doubled fish-nets. Strawberries suffered much from frost, especially Noble, Black Prince, British Queen, Sir J. Paxton; President and Pauline half a crop; good crop on John Ruskin, a variety which here is without flavour and the foliage subject to mildew. *Bailey Wadds, Birdsall Gardens.*

—— The fruit crops in this district were never more promising than this season, up to the frosts of the 20th, 21st, 22nd, 23rd, and 25th of May, when we registered from 3° to 4° of frost. This degree of cold almost destroyed the Apple and Pear crops. Apple King of the Pippins, and Pear Napoleon, have the best crops. Plums on walls where protected are good crops, otherwise they are very poor. Morello Cherries on north walls very good, while those on pyramids are a failure. *W. Higgins, Stanwick Gardens, Darlington.*

—— There was an abundant blossom on all fruit trees the past spring, especially so on Apples, while the severe frosts on and about the 20th of May had much to do with destroying the embryo fruits. I am of opinion that, owing to the long continued drought of last year, the fruit buds so plentifully formed were not so fully developed as they might have been, hence this had something to do with the light crops of fruits—especially Apples: Hawthornden, Beauty of Kent, Cockpit, Yellow Ingestre, and Early Harvest are the only kinds we have that have anything like a crop on them. Of Pears, Citron des Carmes, Doyenne d'Été, Williams' Bon Chrétien, Louise Bonne of Jersey, have fair crops on them. Victoria Plum is the best; Strawberries are the lightest crop we have had for twenty-one years. Red Currants and Gooseberries are plentiful; Raspberries fairly good; Black Currants are almost a complete failure. Insect pests were very troublesome; as soon almost as the trees came into leaf they were infested with both green and black fly. The late rains having well soaked the soil down to the roots the trees are making a good growth now, betokening a fine fruit crop next year. *Henry J. Clayton, Grimston Park Gardens, Tadcaster.*

Hull.—Apples showed good bloom, but suffered from the frost; and the Plum-trees were affected by the dry season of 1893. Cherries: Morellos were cut by the cold weather experienced during May and the early part of June this year. Old plantations of Strawberries suffered from drought during 1893, and the stronger plants from frost and cold weather during May and June of this year. Small fruits showed well, but suffered to some extent from frost. *J. P. Leadbetter, Tranby Croft.*

(To be continued.)

The Rosary.

THE NORTHERN SHOW OF THE NATIONAL ROSE SOCIETY, HALIFAX.

In one respect the National Rose Society has this year been peculiarly fortunate, its three exhibitions have all been held on fine days, which is much to be able to say in so fitful and changeable a time as we have been lately experiencing. The days though fine have not had that blazingly hot character associated with the dog-days, and consequently the Roses have maintained their freshness to a much greater extent than is usual at our exhibitions. The Northern show, which was held at Halifax on the 19th ult., could not have been held under more favourable circumstances, and was decidedly a great success. It was held in the beautiful grounds of Mr. Alderman Booth, the President of the Salterhebble and Halifax Rose Society, and the Roses were arranged under a spacious light tent; while the exhibits for the local Society, whose show took place at the same time, were arranged in other tents.

It was an exhibition in which many unexpected events took place. It was fondly anticipated by some that the northern growers' time had come, and that, as they had been out of the running in the two previous shows of the society, they would make up for it by a successful sweep of the board at the Northern show. We were encouraged to hope for the appearance of Messrs. Alex. Dickson & Sons of Newtownards in the north of Ireland, and of that of Messrs. Harkness & Sons of Bedale, but the former did not put in any appearance, not only not having recovered from the severe frosts of May, but having also suffered from storms a day or two previous to the exhibition, and the hopes expressed by some that the Challenge Trophy would find its way to Ireland were thus disappointed; while the Yorkshire champions were not up to their usual form, and in all the principal leading classes, the south again asserted its superiority. Taking the exhibition as a whole, there was, as at the previous shows, a general lack of superior blooms such as has characterised the two previous exhibitions. There were good flowers, and some fine flowers, but there was also a general level of mediocrity. At the Crystal Palace Show the Teas were certainly in advance of the H. P.'s, but in colour and freshness the order was reversed at Halifax. This was especially the case amongst nurserymen, and the fine stands exhibited by such growers as Messrs. B. R. Cant and Harkness & Sons, Prior & Son, and Paul & Son, contained some flowers of excellent merit. There was, perhaps, a general want of size, and, notwithstanding the statement of some, that this quality is less regarded than it used to be (a statement from which I entirely differ), there can be little doubt, I think, that when it is combined with brightness of colour and good form, most persons prefer a good-sized Rose. The dark-coloured Roses were more, I think in character, as far as colour is concerned, than they were in the earlier southern shows, cool weather having probably contributed to this result. The forward movement of Messrs. Prior & Son of Colchester to the forefront, and the successful appearance of the new firm (new, at least, as far as exhibiting at the National is concerned) of Messrs. Townsend & Son of Worcester, were noticeable features, and will cause, perhaps, some of our veteran exhibitors to "look out for squalls." One has to be careful of one's expressions upon such subjects, for I find that what I said upon the subject of Mr. George Mount's exhibits has been interpreted in a way which the words did not justify. I never said that he was going to displace our veteran exhibitors, but simply that they would have to look to their laurels, and that in some cases he might probably step in before them. In the amateurs' classes another surprise awaited us. Mr. E. B. Lindsell had been so severely hit by the frost that he had been unable to put in an appearance at the two previous shows, so we were hardly prepared to find him exhibiting at Halifax; this, however, he did, and with a box of blooms which I think was not only the best in its class, but also the best in the exhibition, the flowers being of that fine finish that generally characterises this amateur's exhibits. Two jubilee trophies were secured in the professional class by Mr. B. R. Cant, and in the amateurs' by Mr. Lindsell; it will thus be seen, as bearing upon a controversy which seems about to be initiated on the number of blooms to be shown, that even where, as in the jubilee class, the moderate number of twenty-four is fixed, in nine cases out of ten it is the master of big battalions who carries off the much-coveted prize. The Prize Medal Rose was in the Hybrid Perpetual Class, won by Messrs. Paul & Son with a grand bloom of an old and now-a-days rather too much neglected Rose, Duchesse de Morny. There was a time when this fine flower was seen in almost every stand, but it is now comparatively rarely exhibited. A grand bloom of The Bride obtained for Mr. Geo. Prince the like honour among the Teas and Noisettes. In the amateurs' division a grand bloom of another old Rose, Xavier Olibo, secured for Mr. Lindsell the Silver Medal for the best hybrid perpetual; its colour was magnificent, and in fact, when in best condition, there are few dark Roses that can excel it—unfortunately, it is one of those Roses whose constitution is feeble, and therefore, I suppose, small amateurs do not venture upon it. The Medal for the best Tea and Noisette was gained by Mr. Parker, of Headington, with a beautiful bloom of Catherine Mermet.

New Roses.

These were but very sparsely shown, and as on previous occasions the box exhibited by Messrs. Paul & Son contained a considerable number of home-raised flowers. Charles Gater (Paul & Son) was much brighter and less shaded than on some former occasions; Marchioness of Londonderry; Duke of Fife, a sport; Margaret Dickson, shown in fine form; Mrs. Paul, which fully kept up its character as a good and useful Rose; Bridesmaid Violet Queen (Paul & Son), which has a remarkable likeness to a somewhat light-coloured bloom of Sir Rowland Hill and Duchess of Fife. It will be thus seen that only three out of twelve came to us from France; this was the only box exhibited in this class. In the class for new seedlings there was but one exhibit, Clara Watson, shown by Mr. Geo. Prince of Oxford, but which, as on previous occasions, the judges did not consider a Gold Medal Rose, but gave it a Card of Commendation.

Garden Roses

Were not so largely contributed as at the Southern shows, there being fewer exhibits, and the classes smaller, but those exhibited were quite up to the mark. Messrs. Paul & Son again held the leading place amongst professionals, some of their blooms, such as L'Idéale, Gustave Regis, Camoens, and Marquis of Salisbury, were especially conspicuous. Mr. H. V. Machin, of Gateford Hill, Worksop, showed a very beautiful box, conspicuous amongst which were Village Maid, Celestial, and some of the smaller Polyantha Roses. It is a curious circumstance that while the National Rose Society had borrowed from that of Halifax the notion of offering a prize for Roses staged for effect in a given space, there was not one exhibit of the kind at this show; the storms of wind and rain had probably contributed in some degree to this, as we were all looking out to see in what way the Northern folk managed their display, and were of course proportionately disappointed at finding nothing of the kind.

It has been my privilege to have attended all the provincial shows held by our Society, and to have witnessed the various ways in which local societies have discharged their duties. I need hardly say that this varies considerably, but in none that I have attended have things gone more smoothly than in this show at Halifax; while all connected with the local society seem to have worked well, especial praise must be given to its excellent and indefatigable Secretary, Mr. John E. Brooks. I felt convinced that it would be so, for in my previous correspondence with him he had shown an anxiety to master all the details, so as to be prepared for every contingency. The proverbial hospitality of Yorkshire was not wanting on the occasion; and when it is added that upwards of 10,000 persons attended the show, we may conclude that the Northern Show of 1894 will be long remembered as one of the most successful shows that the Society has ever held. *Wild Rose.*

KEW NOTES.

Gladiolus platyphyllus.—This new species of Gladiolus was described by Mr. Baker in the *Gardeners' Chronicle* last year (see vol. xiv., p. 456), from a specimen received from Herr Max Leichtlin, who imported it from Kaffraria along with Gladiolus oppositiflorus. There are plants of it in flower in the bulb frame at Kew, and these also were mixed with G. oppositiflorus received from Professor MacOwan in 1892 (see *Gardeners' Chronicle*, vol. xii., p. 552). Except in the width of the leaves and the colour of the pollen, there is no difference between G. platyphyllus and G. dracocephalus. The Kew plants are 4½ feet high, including the spike, and the leaves are 3 inches wide, and 1½ feet long; the pollen is purple — it is yellow in G. dracocephalus, and there are a few purple spots on the lower part of the small lower segments. There was a plant of it in flower at Kew in September last year, but it was then supposed to be G. dracocephalus simply. G. oppositiflorus is also in flower in the bulb frame at Kew.

Gladiolus aurantiacus rubrotinctus.

This is a distinct and brightly-coloured Gladiolus, remarkable in having orange-yellow flowers dotted all over with red. The type is described as having bright orange-yellow flowers on a lax secund spike. The variety now flowering at Kew was received in the spring from Mr. Medley Wood, of the Durban Botanic Gardens. It has uniform leaves a foot long, and a stem, including the spike, 2 feet high. The flowers are nearly as large as those of G. dracocephalus, not unlike them in shape, and arranged loosely on the spike. There is, however, a well-marked difference between these two species in the size of the three lower segments of the corolla, which in the plant under notice are small and almost of uniform size, whereas in G. dracocephalus they are unequal, the central one being much the largest. There is a large bed of G. dracocephalus now flowering finely near the entrance to the Orchid house.

Hedychium Elwesii.

Mr. Baker described this species from material collected in the Khasia Hills by Mr. Elwes, and now Messrs. F. Sander & Co. have it in cultivation. It has stems as stout as those of H. Gardnerianum, leaves 16 inches long by 4 inches wide, glaucous and hairy beneath, glossy dark green above. The terminal spikes are 6 inches long, formed of about a dozen large dark green bracts, fully 2 inches wide when opened out, and less closely imbricating than those of H. coronarium. Flowers with a tube 2 inches long, a lip 1½ inch wide, petals spatulate, three outer segments linear, stamen as long as the segments; colour, rich yellow, deepening to orange at the base of the segments. The species ranks next to H. coronarium, but is quite distinct from it and all its varieties, and is at the same time a good garden plant. Plants of it are now in flower at the St. Albans Nurseries.

Momordica mixta.

This is one of the most striking of the collection of tropical gourds grown in the Water-lily house at Kew. It has long quick-growing angular climbing stems, large, palmately-lobed, dark green smooth shining leaves, and one-flowered axillary peduncles, bearing each a pair of large green bracts just below the black-purple five-lobed calyx, and a spreading campanulate corolla 4 inches across, formed of five overlapping petals, which are hairy and soft, like flannel, creamy-yellow, with a blotch of purple at the base of the three inner petals. The plant flowers freely, and it is an attractive climber, well worth growing for the sake of its handsome flowers. Both male and female plants are in flower, and the latter is ripening its "large oval-rotundate, red, muricated fruits." M. mixta is synonymous with M. cochinchinensis, and is a native of China, Cochinchina, and India. It first flowered at Kew in 1859, when a figure of it appeared in the *Botanical Magazine*. *W. W., Kew.*

ORCHID NOTES AND GLEANINGS.

ODONTOGLOSSUM CRISPUM VAR. APIATUM.

According to M. Godefroy in *Le Jardin*, July 20, p. 163, this variety is the same as that previously figured in the *Orchidophile* as O. Alexandræ var. Duvali. M. Godefroy goes on to say that the name apiatum was given in the auction-room "devenu en passant sous le marteau du commissaire-priseur, etc." This is an error. The plant was shown in flower by Mr. Ballantine at the meeting of the Royal Horticultural Society, 27 April, 1886, without a name. It is the rule of that society, that a name should be given to a plant before the plant can be formally recognised by the committee. Possibly this was the reason why the present writer was requested to suggest a name for it. In any case he did so, at the request of the exhibitors, being unaware of its history or that it had been already named. *M. T. M.*

Cypripedium Mendeli.

From the collection of Major-General Hutchinson, Bowthorpe, near Bournemouth, comes a flower of this form with three sepals, three equal petals, arranged in a spiral, and each one of a lip-like character (peloria). The column, as is usual in such cases, is straight. *M. T. M.*

A MARKET GARDEN IN EAST ANGLIA.

In many counties old-fashioned agriculture has given place to horticulture, where ordinary garden produce is cultivated for the market in quantities that, until a decade ago, were unknown, and to such a change of circumstances there are many economical aspects well worth consideration. It is fortunate that at a time when agriculture has reached so low an ebb, when it has almost, and in many cases totally, ceased to be profitable, the people's taste for fruit and flowers has so far developed, that the land can be profitably cropped with these wherever soil and climate are such that their culture can be carried out.

A further matter for congratulation is that the new fruit farming employs much more labour per acre than agricultural crops do, and in this way solves in some degree the difficulty that has arisen through the labourers, who have been driven from the land owing to the diminished area devoted to corn-growing, flocking to the already too thickly-populated towns.

East Anglia furnishes abundant examples of farms that have been subjected to such change, and one that we had the opportunity of visiting at Wisbech a week or so ago is about a typical one. At this place Mr. R. H. Bath has an extensive and prosperous farm, which has been planted during the last few years. The principal part consists of the Osborne Farm, but there are other portions at Leverton and Walton, both close to Osborne Farm besides another piece of land at Long Sutton, a few miles eastwards. Altogether, there are nearly 1000 acres of land, and they are on the borders of Lincolnshire, Norfolk, and Cambridgeshire.

Pansies.

In the spring of this year particulars were stated in these columns respecting the amount of Pansies that had been sent from the farm, and doubts were entertained by some as to the accuracy of the figures, so astonishingly large were they, but subsequently confirmatory information was quoted from the report of a committee that was inquiring into the state of labour in the district. There appears to be no reason to doubt that the quantities reported to be despatched were those actually sent, and we know of no place where ordinary fancy Pansies and Violas are cultivated on so large a scale. Of course, at this time in the year there is but little to be seen in this way, as the plants in stock now consist almost wholly of those that were left from selling during spring, and in addition to the plants the immense beds running through the fields where the seedlings are just beginning to make themselves seen. These will be transplanted during August and September, and in spring will be ready for distribution. The long beds that contain these seedlings give one some idea of the amount of labour transplanting will involve, and the immense piece of land they will cover. During one exceptional day in the spring we were informed that 120,000 of such plants had been despatched from this farm.

Until this year almost the whole of the trade in Pansies has been for the market, and of course, they have been seedling varieties selected with care according to colour and quality, and the strain has become good, though no doubt the flowers excel in size at the expense of points that would be required by the florist. Now, however, Mr. Bath has determined to work up a florist's business also, and to propagate by cuttings the very finest varieties that can be got from Scotch and English growers. Amongst stock plants now in flower was a mass of the lovely Peacock sent out by Messrs. Watkins and Simpson, one of the most distinct of Pansies, from its curious blending of blue and crimson shades. Other well-known varieties exist in quantity, and it is expected there will be about 400,000 Scotch seedlings from seed obtained from nearly all the best growers on the opposite side of the Tweed; and the soil being nice and light, yet good withal, the success attending the raising, propagation, and distribution of florists' varieties will be equal to that experienced when catering for the market only.

Carnations

are also grown considerably, and in these, too, it is intended to develop a florist's business. About 2 acres are devoted to seedlings, and nearly all of the latest and best varieties have been added for the purpose of propagation by layers and cuttings. In all there are catalogued in the book 280 varieties, and these include the best of Mr. Martin R. Smith's and of Mr. Douglas's seedlings. Uriah Pike, planted

out in the open, was especially robust, its "grass" being as broad and vigorous as the strongest of the old Cloves. Delphiniums, Digitalis, Scabiosa caucasica, and gold-leaved and other Polyanthus, are also included amongst the plants cultivated; Polyanthus especially being grown in very large numbers.

Fruits.

The fruits, however, were the most interesting at the time of our visit, and we may mention the Raspberries first, as at this time they were so heavily laden with fruit of good quality that they certainly merit the first notice. Of these, then, there are 55 acres at Osborne Farm, 35 at Walton, 36 at Overton, and 48 at Long Sutton, making in all 194 acres. Although, as we have said, the soil is rather light than heavy, and very easily drains itself of moisture, the Raspberries are unquestionably at home, and they have made fine strong canes that would do credit to any garden-culture, their yield and appearance being quite equal to the very best results we have seen in the Raspberry fields in Kent. Some of the best varieties here are Fastolf, Carter's Prolific, Norwich Wonder, and Baumforth's Seedling. The last-named variety has a dwarf spreading habit, and the fruit is very much sweeter than many. Norwich Wonder grows tall, is a splendid bearer, and is prized much by the growers at Wisbech; but Fastolf, as we saw it, commended itself most to our favour. It grows from 3 feet to 4 feet high, is a prolific bearer, and the fruits have, as is well known, a good flavour. A very large breadth of land covered with this variety presented a sight that repaid us well for the journey to Wisbech.

Strawberries, etc.

Strawberries are planted in very large quantities, and with Raspberries are the most important of the fruit crops grown by Mr. Bath. Nearly all are Sir Joseph Paxton, a variety considered the best of any for cropping and flavour. It may be interesting to remark that Laxton's Noble has been discarded altogether as being of no use for market work. Royal Sovereign, however, will better take the place of an early cropper than "Noble" as soon as the price will allow of sufficient plants being obtained, but to be any use as a market kind it must be grown in sufficient quantity to supply a good and marketable lot. At the four places there are 251 acres covered with Strawberries, and the plants look capital, though on the whole this year there has not been more than three parts of a crop. The plantations are not renewed until the plants are four, or even five, years old.

Red Currants had a capital crop on breadths of good bushes about five or six years old. The crop is estimated at about 40 tons. Apples and Pears have not been planted very largely, and they are but young trees. There is plenty of the variety so popular with nearly all market growers—Yellow Ingestre.

Plums on young trees are carrying an abundant crop, and this after casting a great quantity of fruit. The varieties are Prince of Wales, La Delicieuse, and the inevitable Denyer's Victoria. If the crop here is a sample of Plums generally in East Anglia, then a rich harvest of them will be obtained. Along the hedges are planted Damsons of the very best varieties, and here again the crop is as heavy as could be wished.

Several fields were covered with crops of Veitch's Autumn Giant Cauliflower, and these again bore a first-class appearance. Young plants of Strawberries were coming on between the rows, and would make a respectable show when the land was cleared of the Cauliflowers. Now, as regards the markets to which the supplies from this district are forwarded, it may be said that but little of the fruit is sent to Covent Garden, by far the greater bulk going to Newcastle, Manchester, and other northern centres. On the other hand, the Pansies and such like plants are in the main disposed of in London.

A satisfactory and interesting feature connected with the fruit industry here has been left until last. During the fruit gathering season no fewer than 280 people from the crowded parts of London find healthy employment in the country in gathering Strawberries, Raspberries and Currants. Anyone who knows the conditions of life amongst the poor in London is well aware of the immense advantage to such people that such an opportunity presents, and seeing that reports of certain places that have appeared in the daily press have presented an unfavourable statement of the treatment the "Londoners" have received from certain fruit-growers, we may state that under this firm they are treated with fairness. No unpleasantness has arisen under Mr. Bath, except a slight hitch at Long Sutton, a hitch which was very soon put right, and arose only from a misunderstanding. The majority of the hands are the same as went last year, and a good percentage of them have been employed for several years. We were allowed to look through the pay books, and to examine the system of cheques, &c. The week's work brought 26*s.* to some of the best pickers; others earned 20*s.*, others 15*s.*, and some only 10*s.*; of course, those that have gone down year after year are able to gather a larger bulk in a given time than are the new hands. All are paid according to what they gather, and during a rainy time they have to spend an idle time; but a vacation of six weeks at a country place a hundred miles from their grimy homes, their only occupation that of fruit gathering, and afterwards a journey further south into Kent to "hop-pick," is a splendid preparation for winter, especially as they return with a valuable little "pile," an article always "wanted" in the homes of our London poor. With such industries as this there are no regrettable features, and we can wish the culture of fruits and flowers, on a scale such as agriculture has only enjoyed hitherto, the most abundant success.

Fig. 23.—A pot vine grown by Mr. Higgs.

POT VINE.

Our illustration (fig. 23) shows a plant of Foster's Seedling, three years old from the eye, and bearing eight large bunches. It was grown by Mr. Higgs, The Gardens, Fetcham Park, Leatherhead, and is a good illustration of successful culture and of decorative effect.

FLORISTS' FLOWERS.

THE CARNATION AND PICOTEE.

The Carnation season will soon be over, the hot dry weather we had about the 28th and 29th of July causing the blooms to collapse rapidly in the south. We commenced layering on the 25th, and shall con-

tinue to do so less or more until the third week in August; by that time all this work should be completed. Those intending to save seed should see that the best flowers are fertilised and marked with the names of both the seed and pollen-bearers. The amateur cultivator of Carnations loses a great deal of the pleasure that may be obtained from the cultivation of these flowers if he neglects to fertilise them for the purpose of raising new varieties. Not only do we derive pleasure from anticipating the flowering of seedlings, but the consummation of the florist's work is to obtain a higher standard of excellence than any previous cultivator has yet reached; but no one can reach this point unless his heart is in the work. The decorative value of the Carnation was never so much appreciated as it is at the present moment, and the object of the seedling raiser should be to obtain varieties that would be valued for cutting to place on the tables and side-boards in the rooms where they can be seen to the best advantage, as also for ladies and gentlemen's personal adornment. The Carnation Society has introduced classes into their schedule, especially to encourage exhibitors to show their skill in arranging Carnation blooms to the best advantage, and because of this I was glad to see a few critical remarks made at p. 104; but to make such remarks useful the critic should be a little more explicit. In the class for six button-hole flowers, the remark is made, that there were few in the 1st and 2nd prize exhibits that "a gentleman would care to put into his coat." They were all medium-sized blooms of the finest quality, and neatly set up with Carnation foliage. What is your reporter's idea of a "button-hole" flower? They are sold much larger in Covent Garden Market in the Centre Avenue. Indeed, I saw one worn by a gentleman, for which he told me he had paid a shilling, so large that I could not believe it was a single flower; and when I examined the "button-hole," I found three Carnations had been tied together, the petals crushed up to form one flower. These are what gentlemen wear in their button-hole! and it is to show what a Carnation for a button-hole ought to be that the Carnation Society give prizes. The exhibitors in this instance were Mr. Blick and myself, and I thought we both knew what such ought to be. Were they too large or too small, or what?

I do not complain of any kind of criticism; it is the duty of reporters to take note of anything, and to pass an opinion upon it; but it ought to be in such a way that both exhibitors and readers of the report may be benefited. Suggestions for improvement in exhibiting the Carnation and Picotee will be highly valued and carefully considered.

We have often been soundly rated by the Editor for showing the blooms on cards, and this year a new departure was made by showing them without, and merely with a spray of their own foliage. I thought they looked very pretty, but all the notice we get is that they "scarcely showed the blooms to advantage." But these are matters of detail, which others might consider differently. One thing was patent to all growers who know anything of Carnations, and that was the great improvement made during the last few years in the self-coloured or border varieties. Several Awards of Merit and Certificates were made to new varieties, but as these have already been reported upon, it is not for me to add more, except to say that there is still room for improvement, as some of even the best varieties have a tendency to droop. The foot-stalks of the flowers are not strong enough to support the blooms erect, and their excellence is not to be appreciated until the flowers are handled. This was a point the President of the Society (Martin R. Smith, Esq.) alluded to at the luncheon after the Awards were made. Mrs. Reynolds Hole, for instance, has flowers which hang down so much that nothing but the calyx and outer rows of petals are seen when they are growing in the flower borders. Pride of Penshurst has this fault also, while Germania is free from it. Most of the new varieties to which Awards were made had not this fault. In future I will not save seedlings that do not carry the flowers bravely in an upright position, nor will Mr. Martin Smith do so.

The yellow-ground Picotees all carry their heads well up, and in an erect position. Most of them have been raised by myself, and this is a point I have paid strict attention to. The yellow-ground Picotee is being brought to the same standard of excellence as the white-ground varieties, and in the process it is interesting to note the way in which the seedlings revert to the earlier and less perfect varieties, and how very difficult it is to obtain better varieties. I have raised hundreds of seedlings from Mrs. Robert Sydenham, but none equal, much less superior, to it. The only thing we can do is to work away patiently in the hope that the best varieties now in cultivation may be improved upon in time. This can only be done by careful cross-fertilisation with the best flowers, and I may add here that an amateur should not try to do everything in one season. Select one or two classes in which improvement is most needed, and follow them up until the object in view has been accomplished. *J. Douglas.*

ROBERT JOHN THORNTON, M.D.

(*Continued from p.* 90.)

Now, a few words with regard to the estimated and market value of these coloured engravings. I have before me a priced catalogue of them, issued in 1893, in which the prices for single plates, with the accompanying letterpress, ranges from £7 7*s.* to £25! No fewer than nineteen are priced at £20 and upwards each! Within the last twelve months I have seen a set of eighteen of the same plates offered in the catalogue of a provincial bookseller, without any indication of their origin, for the sum of 30*s.* I have also received officially various offers at about the same rate, and I have actually purchased for myself sixteen of them for the sum of £1! The latest development in this connection, is that the members of the Kew Bee Literary Society were to have the opportunity of bidding against each other for the possession of "the grand copy of Thornton's *Temple of Flora and Sexual System of Linnæus.*"

Thornton's own estimate of the value of these plates and other works published by him was probably based, to some extent, on the outlay, which must have been very great. In 1811 he obtained an act of parliament to enable him to dispose of his collection of paintings, drawings, engravings, &c., by way of chance, that is, by way of lottery. In the copy of the *Temple of Flora* in the library of the Botanical Department of the British Museum there is an original of the Act, and the prospectus issued therewith by Thornton. This document would occupy a page of the *Gardeners' Chronicle*, therefore I can only give a few of the more important particulars contained therein. It was designated the "Royal Botanical Lottery, under the patronage of His Royal Highness the Prince Regent." There were 20,000 tickets, at two guineas each, and 10,000 prizes of the total represented value of £77,000. The first prize was stated to be worth £5080, and included, among other things, the original full-length portrait of Linnæus, in his Lapland dress, by Hoffman. As Mr. Carruthers mentioned, in his presidential address to the Linnean Society in 1889, it is uncertain what became of this portrait, which he believed was a replica of one painted for Gronovius in Holland, and now in the possession of A. H. Cliffort, the descendant of Count Cliffort. Linnæus's great work, the *Hortus Cliffortianus*, will be remembered in this connection.

I have already stated that I have not seen two copies of the *Temple of Flora* exactly alike; and the description of the work in the prospectus of the lottery does not help in the least. Indeed, it would appear that the *Philosophy of Botany*, and a *New Illustration of the Sexual System*, in small folio only at Kew, with numerous beautifully executed plates, formed part of *The Temple of Flora*; for the second class of prizes is described as being "composed of that elegant and national work called *The Temple of Flora*, which consists of five folio volumes, containing several hundred beautifully-coloured plates, engraved by Bartolozzi, Earlom, Landseer, and other distinguished artists, valued at £15,920." Yet this is not borne out by available evidence. In the Kew copies of the books bearing the titles first cited, several of the plates in the above enumeration are repeated on a smaller scale. Possibly *The Temple of Flora* was the general title of the work, and the others secondary ones. From the fact that Thornton died an impoverished man, the lottery was doubtless a failure.

This article is already long, but before concluding I should like to say a few words about the portraits of botanists and other scientific men which are given in one of the volumes, entitled *The Philosophy of Botany*. They are mostly exquisite engravings, each with some appropriate adjunct, such as the plant named after the person, the scene of his labours, or the nature of his work. Here, as in the case of the plants, the names of the persons whose portraits are given, together with painter and engraver, will perhaps best answer the purpose intended.

In the list preceding these portraits, the names of a dozen other celebrities are given; but their portraits were probably never published by Thornton, in consequence of the expensive nature of the undertaking.

With regard to Thornton's other works, I may mention that his *New Family Herbal* is illustrated with woodcuts by Bewick; but certainly not of such a quality as to have given the artist fame. *The Greenhouse Companion* was published in 1824; and the last work of our author, of which I have found any record, was the *Introduction to the Science of Botany*, which appeared in 1833.

Perhaps the foregoing particulars respecting Robert John Thornton and his works may elicit some more precise information on this subject. *W. Botting Hemsley.*

ON THE USE OF MINERAL MANURES.

Whilst in agriculture mineral manures are held in the highest estimation, in gardening they are still comparatively little used. For several years past I have been using them, and I may say, speaking, generally, that I have never had such strong, healthy, free-blooming plants as I have had during that time. Here and there I have had some failures, it is true, and many a plant, valuable to me, was killed by the manure; but that will occur always where experiments are made in a totally new field. It will be best to give first a brief account of these failures. I used five or six manures, hereinafter mentioned by number only, viz.:—

1. Nitrate of potash.
2. Phosphate of potash.
3. Phosphate of potash with nitrate of potash.
4. Wagner's flower and garden manure (containing 13 per cent. phosphoric acid, 11 per cent. potash, and 13 per cent. nitrogen).
5. Albert's garden manure (containing 16 per cent. phosphoric acid, 20 per cent. potash, and 13 per cent. nitrogen).
6. Albert's Hop manure (containing 13 per cent. phosphoric acid, 25 per cent. potash, and 13 per cent. nitrogen).

I manured Chorizema ilicifolium and C. Lawrenceanum. The plants almost all died within a

few days, with the exception of those manured with No. 2; but even those became so weakly that I have but little hope of saving them.

Heliotropium peruvianum manured with No. 2 in powder: one plant died within a few days; the leaves on another turned brown and fell off, but buds formed, and now the plant is bushy, strong, and healthy. Azalea indica received No. 2 also in a powdered form: the old leaves turned brown and fell off, but the plants made a very healthy second shoot, and look now very well. They are dark green, and covered with buds. Gloxinia, manured with powdered No. 3: after some hours the plant was weak, and hung down. Inspection showed that some of the powder was left upon the stalk, where it had, as it is very hygroscopic, absorbed from the plant the water, which was now in thick drops upon the stalks. I removed this and washed the plant. It became healthy. Humulus Lupulus manured with No. 6 in a powdered form: the old leaves became brown within a few days, but the plant made an immense number of new healthy shoots; almost every shoot bore a new bud. A dwarf Fuchsia and also a delicate pretty Fuchsia, with little flowers and long stamens (calyx purple, petals dark blue; not the gracillima), manured with powdered No. 2, became sickly. Callistemon rigidus, Kunzea corifolia, Leptospermum lanigerum var. pubescens and scoparium, Melaleuca acuminata, armillaris, Baxteri, coronata, cuticularis, diosmifolia, imbricata, lateritia, microphylla, parviflora, Preissiana var. leiostachya, pulchella, thymifolia, thymoides and viminea var. Lehmann; all manured with No. 2, thrive well, but the leaves are yellowish-green, compared with those of the same species manured with other fertilisers.

These are the failures, now for the successes: Primula sinensis, different forms, which I received at the beginning of November last year, are manured regularly with No. 5, and now and then with No. 1. Until now, that is, the end of July, the plants have flowered continuously, and so freely that often nothing else was to be seen of them but their flowers. The flower-stalks remained relatively short, so that the flowers were immediately above the leaves; the flowers became very large, and only during the last four weeks have smaller blooms appeared. Fuchsia hybrida, different varieties, young cuttings made this year, manured with No. 2: in a short time in the axil of every leaf literally there appeared two, sometimes three flower-buds, one above the other. The flowers grew very well and opened, no bud fell off. Pelargonium zonale, manured also with No. 2, formed many inflorescences, composed of many flower-buds, which all opened. The same species, manured with No. 3, formed larger leaves and flowers. Humulus japonicus fol. var., a very good climber, manured with No. 6, grows very quickly; the foliage is strong and healthy, the contrast of the colours, dark green, greenish-white and pure white, is superb. Ampelopsis hederacea, manured with the same, grows well, but it is not easy to prove that it grows better than when unmanured, whilst the same species, manured with No. 1, grows very quickly and forms strong shoots and dark-green leaves. Dahlia variabilis, a dwarf yellowish flowering form, manured with No. 1 at first, afterwards with No. 2: the leaves are as thick and strong as those of Eryngium, flower-heads appeared very early, at the end of May, and are still blossoming. The plant is about a foot high. Pteris serrulata manured with No. 1: this plant, a little one, threw up at once some five or six fronds of a bluish-green colour, and four times as long as the old ones. The same result was obtained with a Nephrodium. Palms, such as Phœnix canariensis, reclinata, and rupicola; Kentia Fosteriana and Blackburniana; Areca Baueri, rubra, Chamædorea desmoncoides, Ernesti Augusti, geonomiformis, manured with No. 1 are growing vigorously; also Corypha australis. Myrtus communis, the small-leaved form, manured with the same, becomes the large-leaved form, and grows immensely. It was then manured with No. 2, and numerous buds appeared. The above-named Callistemon, Kunzea, Leptospermum and Melaleuca, manured with Nos. 3, 4, 5, and 6, are growing very vigorously. The leaves of some species become three times as long as the old foliage. The colour of the leaves becomes bluish-green.

Now I must add a few words about the method of application of these manures. As above shown, the powdered form, laid on the top of the pot, cannot be recommended. The same manure given to the plants in solution, or mixed with the earth before planting, gave better results. I give the manure mostly in solution, 1—2 : 1000. Once accustomed to manuring, you can give this solution daily during active growth. It is a good plan also to mix the manure with the earth before planting (2 : 1000), but the mixing must be done very thoroughly. It is still better to make a solution of the manure and to spray this over the earth before planting. But in this case, do this some days before planting, so that the earth becomes again somewhat dryer. The prices of the manures are small. 10 kilogrammes (= 22 lb.) cost 3·8—4·2 Marks (1 Mark about 1*s.*), and suffice (in solution) to make 5—10,000 litres of liquid manure (1 litre = 0·220 gallons). But there is still another point which makes manuring very economical: manured plants may remain in the same pots, whilst unmanured plants have to be transplanted twice into larger pots. So you spare time, and pots, and earth, and also, as I showed, some years ago, a manure heap. *U. D., Berlin.*

Fig. 24.—COLUTEA MELANOCALYX.

COLUTEA MELANOCALYX.

Boissier in his *Diagnoses*, 1—9, p 35, and afterwards in his *Flora Orientalis*, ii. (1872), p. 194, maintained this form as distinct from the common Bladder Senna, C. arborescens, the principal distinction consisting in the calyx, which in the original form is said to be thinly covered with white (? brown) hairs, and of which the triangular teeth are five to six times shorter than the tube. In C. melanocalyx the calyx is densely covered with dark brown (fuliginous) hairs, and the calyx teeth are only one-third shorter than the tube. The young fruit is also described as hairy and not glabrous—dis-

tinctions which are minute at the best, and scarcely seem likely to be constant. That, however, is a matter of experience. C. melanocalyx is a native of Lycia and Pamphylia. For the specimen from which our figure was taken we are indebted to W. E. Gumbleton, Esq.

FORESTRY.

TIMBER PRICES IN WILTS.

So far, 1894 has not been a satisfactory year to the seller of home-grown timber, and indications do not point to early improvements. With us in the south-western counties there has been for some seasons past a ready market for all descriptions of Elm. Owing chiefly to the extreme depression of the Welsh tin-plate trade, for which a large quantity was every year consumed in boxes, the demand has greatly slackened, and figures have drooped in sympathy. Just now, of course, we are between the seasons, at a time when there is never much changing hands; but with many of the spring purchases standing over, there is very little chance of an early autumn inquiry. Taken all round, Elm has not been so little sought after since the gales of twelve or thirteen years ago. Oak, too, meets a very slow sale; in fact, except for special dimensions, it is worth little more than the price of Elm twenty years ago. A shilling per foot for fair-sized Oak is not at all an unusual figure. Ash, when good, is always in steady demand; but, unfortunately, in the way it is generally grown, from a third to half the bulk of the tree is practically only fit for the commonest uses. Amongst the Fir tribe, Larch is about the only kind bringing a fair return, as there is no regular outlet for Scotch and Spruce. There is not, however, much of either sort growing in the immediate neighbourhood. Elm, Oak, and Ash, in the order given, are by far the most important.

Waste in Ash Growing.

Hedgerow timber has been the source of much controversy. Into this, as a whole, it is not my intention to enter now, but hedgerow Ash should be avoided in every possible way. The shallow and wide-spreading roots, it is well known, beggar the surrounding soil for a long distance; but what is still more unfortunate is the poor quality of the timber, compared to what is grown closely in woods. What is essential in Ash is a long, clear stem, free from knots. Such wood, except in very rare cases, is not to be found in the open. Left alone to grow in its own way, trees will develop side branches, and consequently shorter stems. To this drawback is too often added the more fatal one of lopping, which at once ruins every bit of timber above the knots so caused, and in very many instances causes decay below. It is very clear, therefore, that the chances of growing fairly saleable Ash in the open are very scarce indeed. Fortunately there is no need, as it is not an important landscape tree, like the Elm and Oak, and what is further, generally thrives well in the closest quarters. I have very recently had occasion to deal with some young Ash grown amongst thick Oak and Scotch Fir. This may, perhaps, be an extreme case, but many of the trees run from 50 to 60 feet in height, and devoid of branches, with a diameter at butt of not more than 6 to 8 inches. Although, as I have said, an extreme instance of close growth, it will serve to illustrate the wide range of conditions under which Ash may be produced. Economically, there can be no question as to which of the two systems is nearer the true one, as almost every bit of the long close-grown stems can be used for the best class of work; whereas had the same amount of cubic contents been grown in the open, and subject to natural development, and also to accidental or intentional interference, from a third to half the bulk would have been little better than firewood.
D. J. Y.

THE WEEK'S WORK.

THE KITCHEN GARDEN.

By Arthur Coombes, *Gardener, Himley Hall, Dudley.*

ONIONS.—Sowings of the varieties may now be made on ground prepared as previously advised. Before drawing drills dress the land with soot and wood ashes, hoeing and forking these into it, the latter course if weeds are appearing being the better one. It is not advisable to use salt as a dressing on the occasion, as it has a tendency to make the ground retain moisture, which is not good for the Onion plant in the winter. Having trodden the land lightly, draw drills of 1 inch deep at 6 inches apart, sow the seed, if good, thinly and cover over—a thin braird more desirable than a thick one—the plants not getting drawn and weak. The White Spanish Onion is a variety that may be sown for drawing this autumn and in the spring. Where Onions suffer much from the grub, and the plants stand well through the winter, it is advisable to sow some of the ordinary summer varieties and transplant them in the spring, the experience of many growers having proved that the grub does not attack transplanted Onions like it does those spring-sown. The seed must not be sown on ground in a pasty condition, but the gardener should wait till it is fairly dry before sowing. The remainder of the last season's crop of autumn-sown Onions, if sufficiently matured, may be laid in a dry airy place, and when dry put into store.

ENDIVE.—Sow forthwith seeds for raising plants for affording late winter and spring supplies, making the sowings where some of the plants can remain to finish their growth. The rows in the latter case may be made 12 inches apart, otherwise 6 inches will suffice, if alternate rows are taken away, and the plants left at 10 inches apart in the rows. On land manured for a previous crop no further manuring will be needed for Endive. Plant out those that are large enough to plant from previous sowings 1 foot apart, and water them, if the weather be dry, at planting time and afterwards.

MUSHROOMS.—Manure may be collected together for making the earliest beds in the Mushroom-house, or ridges out-of-doors, and if for the former, the quantity of strawy litter retained may be less than is necessary with ridges. The preparatory heating and turning over and mixing should be carried out in both cases. In making the beds or ridges the manure should be made very firm by beating with forks and treading it.

SPINACH.—Another sowing should be made of summer Spinach, Victoria, Monstreuse de Viroflay, and ordinary prickly winter varieties doing equally well. The first sowing may now need hoeing and cleaning of weeds and decaying leaves.

CORN SALAD.—A sowing may now be made on dry light soil, or, if that cannot be found in the garden, light sandy refuse soil from the potting bench put on the bed will make a suitable seed-bed. Sow in drills thinly, 8 inches apart, thinning the plants to 6 inches apart when large enough to handle.

FRUITS UNDER GLASS.

By Bailey Wadds, *Gardener, Birdsall Gardens, York.*

CUCUMBERS.—For early winter supply the plants should be planted out in beds of well-prepared soil, formed about 1 foot deep, and consisting of turfy loam, leaf-mould, and rough sea-sand. A sowing of seeds or a number of cuttings should be put in for furnishing succession-plants. Cuttings strike freely in bottom-heat of 80°, and top-warmth of 70° by night, and 85° by day. Plants for winter fruiting should be grown sturdily, the growths not allowed to get crowded, a liberal amount of air being daily afforded, and shade also during bright sunshine only. But few fruits should be taken, so as not to weaken the forces of the plants before the short days set in. Red spider and thrips must be kept destroyed, and to this end strong growth and light cropping, &c., are a great help. Plants now in full bearing should be afforded liquid manure occasionally, and dressings of rich soil whenever the roots show at the surface. Syringe the plants twice or thrice daily, cast off foliage infested with red spider, and keep the shoots thinned out, deformed fruits being removed unless seeds are required; the best seeds sometimes being obtained from fruits having a thick end. A piece of string tied tightly round the middle of a fruit will cause seed to be formed in shy seeding varieties. Maintain the proper degree of heat in hot bed frames and pits by means of linings, if the plants are to be kept growing through the autumn.

PINE-APPLES.—Those intended for fruiting early next season should be sturdily grown, with stiff shortish leaves, and in maturing them care should be taken not to incline too much to dryness at the roots. The pots should be filled with healthy roots, and the plants in a state of rest at this period. Succession plants must be kept in a growing state, and the potting should now be finished. The bottom heat for succession plants keep steady at 85°, water when afforded being of the same temperature. Plants for late fruiting, whose fruits have begun to increase rapidly in size, may have liquid-manure water liberally applied, a moist atmosphere maintained, and sun-heat made use of whenever possible. Suckers and crowns, when ready, pot in 6 and 7-inch pots, plunging them in bottom-heat of 80°, damping and shading them for a time, as previously recommended.

FORCED VINES that have become exhausted by early forcing and overcropping, or which have suffered from the ravages of insect pests, should now have attention, and where the borders are old or have not been renovated recently, or the drainage is not in order, the soil should be replaced with new material, after putting the drainage and floor in good repair. If mealy-bug has been troublesome, a new inside border will greatly aid in getting rid of the pest, and should Vines not be considered worth the cost of lifting, new ones should be planted in the new border. But when the Vines are vigorous, the inside border may be made one year and the outside one the next. In the case of Vines that are to be forced early this plan answers very well, if the work be begun early in the autumn and carefully carried out when the leaves turn yellow and begin to fall. It would not, of course, do to take up a growing Vine and re-plant it, as the result would be the same as with any other deciduous subject, but transplanting may safely be done at the fall of the leaf, or even just before the Vines start in the spring.

PLANTS UNDER GLASS.

By J. F. McLeod, *Gardener, Dover House, Roehampton, S.W.*

ERICAS.—These plants will now be assuming a bright appearance, in so far as regards those which flower in the early autumn and are now developing their flowers. The tying-out of the plants having been done in the manner advised in the spring, little is now required beyond adding a few more ties where it is noticed that such would be desirable. Great care is called for in doing this, as the twigs break off very easily. The affording water to Heaths is at all seasons a matter of some nicety, and doubly so with these varieties at this stage, and it is well to keep on the dry side, although this must not be understood to mean that an actually dry state of soil is recommended, simply that for the better preservation of the bloom no superfluous water should be afforded, or thrown about on or under the stages. All the air possible should be given, and on bright days a slight damping of the paths, walls, &c., may be afforded, avoiding all fixed shading, but making use of roller blinds during the hottest part of the day.

DIPLADENIAS.—These, from their twining habit, require a frequent regulation of the shoots, whether trained on a small trellis or as plants covering a part of the roof of a stove. The plants are liable to be infested with green and black aphides, and to keep these insects under, the plants should be syringed once a week with soapsuds, made on purpose with 1 ounce of soft soap to 1 gallon of rain-water. Dipladenia amabilis (profusa), D. Brearleyana, D. splendens Williamsii, D. insignis, and the well-known D. Boliviensis, are the best varieties.

LILIUM AURATUM.—Plants which are coming into flower may be encouraged by applications of diluted farm-yard drainings once a week. L. lancifolium album and L. rubrum, not being gross feeders should have merely a top-dressing of good loam and fresh horse-dung, the latter forming one-fourth of the entire bulk.

CAMPANULA PYRAMIDALIS. — Maintain the plants in vigour by the use of some kind of artificial or other manure, and unless the plants have to be transported some distance the stems will need no support from sticks. Young growing stock for later flowering as it seems to be needed should be given pot room, for if the plants suffer from lack of rooting-space the foliage soon begins to fall off, which at once robs the plant of decorative value.

BOUVARDIAS.—These plants will now be pushing up strong shoots from the base, which must be encouraged to extend and grow strong by affording them light and space; to this end the outer branches should be slightly tied down, so that the centre of the plant is opened out. I have found slender Bamboo canes very suitable for this kind of work, as they are very pliable, and when carefully placed, seldom noticeable at a short distance.

LILIUM HARRISII.—The bulbs now to hand should be potted-up in 48's for single bulbs, and 7-inch pots, if three in a pot are grown, in which sizes they will be very effective objects. Afford them good drainage, and a rich loamy compost, with a liberal addition of sand. Stand the pots out-of-doors on beds of coal-ashes.

THE APIARY.

By EXPERT.

CONTRACTING HIVES.—Hives may now be contracted, with the object of crowding the bees, and getting a continuance of honey stored in the supers instead of in the brood frames. For this purpose the brood-nest may be reduced to seven or eight frames, and the number will be enough for the stocks to winter on. With the object of preventing swarms too many frames are often used in the brood chambers of hives, and if the number were restricted to nine for general purposes, especially in poor honey districts, a larger surplus would be secured. Super space should also now be reduced, and all sections or extracting frames not commenced should be removed. The second crop of Clover is now in bloom in most places, and Blackberries are almost at their best, so that if the present favourable weather continue, a good deal of honey may yet be obtained, which will in a measure make up for the disappointments experienced earlier in the year. In heather districts it will soon be time to make preparations for obtaining honey from this source. If the bees are crowded below, and given worked-out combs in which to store the honey above, success will be attained, provided that the weather is fine. Hives may easily be reduced in size by using dummies; and a ready way to make these is to nail a piece of thin wood on each side of a standard frame, filling up the space between with chaff, sawdust, or other suitable material. If one frame does not give the width to fill the required space, two or more may be nailed together, the pieces of board being fastened on either side as before.

THE PREVENTION OF ROBBING.—In removing honey from hives now, the evening will be found the best time for the operation, and care should be taken not to leave any honey exposed, or robbing may quickly be started. As the honey is taken out, a good plan is to have a box at hand to put it in, which can be kept covered by a lid, or a piece of cloth thrown over the top. While the hive is open, it will be a good opportunity to examine the brood frames for eggs, so as to make sure that a queen is present, as if this necessary operation is put off till later, there will then be risk of "balling" taking place. For the same reason, any re-queening that may be necessary should be taken in hand at once, before honey ceases to come in.

THE FLOWER GARDEN.

By JOHN LAMBERT, *Gardener, Powis Castle, Welshpool.*

VERONICAS.—These beautiful (and what is more to the purpose in many places) useful class of plants, may now be propagated from cuttings, choosing as such the young firm growths of about 4 inches in length. Insert the cuttings when made in pots filled with some ordinary kind of mould, mixed with plenty of sharp sand; and afford good drainage to the pots. About ten cuttings will be a proper number for a 4½-inch pot. The cuttings should possess a heel of last year's wood, and should be made firm in the soil, and after being well watered placed in a cold frame and kept close till rooted, afterwards hardening them off gradually. They should, when well rooted, be potted off singly in small 60's. A few useful varieties are gentianoides, Chamædrys, incana, and spicata.

HOLLYHOCKS.—These plants will be benefited by a heavy mulch of rotten manure, and an occasional heavy application of water. Look carefully to all the fastenings, to see that they are not cutting into the stems.

LYCHNIS.—Cuttings of the young flower-stems, which are not become too hard, may still be made; and the double-flowered Rockets, Antirrhinums, and several other perennial plants of this class, may still be increased in the same way.

HUMEA ELEGANS.—If seed has been sown as advised, the seedlings will now be ready for potting into thumb or small 60-pots, according to strength; and a compost, consisting of fibrous loam with a small quantity of sand, lime-rubble, and finely-broken bones mixed with it, suits the plants admirably. Return them to a greenhouse temperature after potting, and in a position near the roof-glass, so that they may not get drawn; shade them till re-established, which takes but a few days.

THE ORCHID HOUSES

By W. H. WHITE, *Orchid Grower, Burford, Dorking.*

SOBRALIAS.—Most of the species of Sobralia are free growers, succeeding in an intermediate house; and they should oftener find a place in collections than is the case at present. The individual blooms having no stalk, are of little use when cut, and they last but for a short time; still the plants, when established, afford a long succession of flowers, which compensates for the blooms being short-lived; and coming into flower when there is a scarcity of Orchid blooms is a point in favour of the cultivation of the plants. An unusual and interesting spectacle was seen at Burford a few days ago, when eight distinct species and varieties of Sobralia were in bloom at the same time. These consisted of S. macrantha splendens, the yellow-flowered S. xantholeuca, S. leucoxantha, S. albo-violacea, the white S. Liliastrum, S. Warscewiczi, also a distinct species similar in some respects to S. macrantha, but the colour of whose sepals and petals bore a resemblance to those of Cattleya superba, except that they were smaller, and had a yellow throat. At present this species has not been recognised at Kew. Another was a distinct and pretty variety of S. xantholeuca, named Princess May, with white flowers and a lip frilled at the edges; the disc coloured lemon-yellow, with a faint suffusion of pink. Other varieties of sterling merit are S. virginalis, S. macrantha alba (Kienastiana), and S. Lucasiana. Sobralia Cattleya has not, I think, hitherto produced flowers under cultivation in this country, although many methods have been tried to induce it to do so. There is at Burford a strong plant with growths measuring nearly 10 feet in height, which has been grown for many years in a variety of temperatures and positions, and at present is standing in the open air in full exposure day and night. According to the description given by the late Professor Reichenbach in the *Gardeners' Chronicle* in 1877 it will, when we get it to flower, prove to be a beautiful and distinct variety. All of the above species, being very strong growers, require plenty of pot room; and any which may have become pot-bound can with safety be afforded a liberal shift so soon as the new breaks commence to show themselves. Early spring is probably the most suitable time for repotting the plants, but where a plant is suffering from want of a larger pot, it may be performed at almost any time. Unwieldy specimens may be divided at this season. Well-drained pots, and a soil consisting of lumpy, fibrous peat and rough, sandy loam, with a small quantity of sphagnum-moss, will suit the plants. The compost should be pressed down, and a space of half-an-inch left below the rim of the pot for affording water, a good deal of which is required in quantity in the growing season. It is not always necessary to repot a Sobralia immediately it has filled its pot with roots, nor is it desirable, as the plants soon become too large and unmanageable if frequently repotted. We have a large healthy specimen here, which has been in the same pot for eight or nine years, and by giving it copious supplies of water, and occasionally liquid manure, it grows well, and blooms freely every year.

THE MEXICAN-HOUSE.—This is now gay with several forms of Cattleya Eldorado, among them being the variety splendens, with the rich, dark coloured lip; also the variety Wallisii, which has white flowers with an orange-coloured disc on the lip. C. Eldorado is well worth growing in quantity: the flowers lasting a long time in perfection, and varying in their colouring—scarcely any two of them being exactly alike, which is in their favour; moreover, it is rare to find an inferior variety amongst them. The flowers have an agreeable fragrance. As soon as these plants go out of flower they should be kept rather dry for a few weeks, but not so much so as to cause shrivelling of the pseudobulbs, placing them in a light position in the same house as that in which they have been growing, and where they can obtain plenty of fresh air. The new roots will soon push from the flowering breaks, and thereby aid the plants to recover their vigour. The best time for repotting is just before the appearance of the new roots. After repotting water should be afforded, to nourish the new roots and preserve the old ones. Their so-called resting season commences when re-establishment has taken place. This species, like C. superba, should not be subjected to so low a temperature as is generally afforded the majority of Cattleyas. I have been recently informed by a competent authority who has been living in the Cattleya Eldorado district for some considerable time, that these plants are always in a more or less fairly moist condition. For the next few weeks a brisk temperature must be maintained in the warmer divisions, many of the plants being in active growth. Although no great amount of fire-heat is required by day, the hotwater-pipes should be made sufficiently warm before finishing up for the night, so as to prevent the warmth falling to too low a point. A preventive against "spot" is to slightly open the top ventilators at night, which will allow some of the humid air to escape. The night temperature for the present should be as follows:—East Indian-house, 70° to 75°; Cattleya, 65° to 70°; Mexican, a few degrees below 70°; cool houses, if the external air will permit, about 55° to 60°; the higher degree of warmth being that of the house the last thing at night, and the lower one the early morning temperature.

THE HARDY FRUIT GARDEN.

By T. TURTON, *Gardener, Maiden Erlegh, Reading.*

SUMMER PRUNING OF THE APPLE.—A beginning should be made in the pruning of such trees as have become filled with young shoots, cutting the strongest of these back to three or four leaves, also any which may unduly shade the fruits, but leaving the rest to be pruned over in about one week later. Where the trees are of large size, rather than risk giving a check to the growth of the fruits, by finishing the pruning at two operations, select only the strongest growths for cutting back at the second pruning, and in another week finish the work. In the case of young trees, all the leading branches should be left uncut. These remarks apply chiefly to trees worked on Crab stocks, and to those on the Paradise or dwarfing stock, which may be growing in heavy land and making strong shoots, but the usual run of Apple trees on the Paradise stock, which are bearing full crops of fruit, may not require any pruning till late in the autumn,—that is, after the crop is gathered. Continue to freely thin early varieties for use where the crop is a heavy one.

APRICOTS.—Should rainy weather continue, and the fruits ripen unsatisfactorily, it will much improve the flavour to gather them in shallow boxes lined with paper, and place in a warm airy vinery where Grapes are ripening, keeping them there for a few days before they are eaten or preserved. On the other hand, should wasps become troublesome, the fruits may be gathered before being quite ripe, and placed in a vinery where the Grapes are ripe, from which wasps are excluded.

ORCHARD TREES.—Take the earliest opportunity to thin out the spray from the middle of the heads of all trees, removing these small shoots entirely with a sharp knife. If this operation be done at this season, there is less risk of other shoots growing from the base of those severed than if the pruning were deferred to the winter. If American-blight be present near the wounds caused by the removal of branches in the winter, let the bark be dressed with soft-soap and petroleum emulsion.

RIPE FRUITS.—As soon as wasps, flies, &c., begin to feed on Apricots, Plums, and other ripe fruits, which they may be expected to do on the return of bright weather, means should be taken to trap them; and nothing is more efficient as a trap than one made by placing a sound hand-glass on the top of another, the bottom one being placed on four bricks, and baited with blemished fruit or sweetened beer. A small hole is made in the cover of the bottom hand-glass, to afford an entry for the insects into the upper chamber, and the space between the two lights is closed at the edges with paper covered with earth. Recourse should also be had to trapping them in moderately wide-mouthed bottles half filled with sweetened beer, and hung on the walls; put also a few yards away from the trees which are carrying ripening fruit. Large numbers of wasps and flies may be got rid of in this manner.

GENERAL HINTS.—The budding of Apples, Pears, &c., should be finished without further delay. Loosen the ties of those put in last month, and where they are disposed to grow the side shoots should be shortened. After the buds have started well into growth prune the side shoots back to the base, thereby concentrating the energies of the stock in the growth of the scion, which should make a good shoot in time to get ripened by the winter. Look over and remove all bad fruits from Bigarreau, Napoleon, and other late varieties of sweet Cherries, the season of which it is desired to prolong. In fine weather ply the hoe among bush-fruits, but weed by hand in the event of rainy weather continuing.

EDITORIAL NOTICES.

Advertisements should be sent to the PUBLISHER.

Plants, Fruits, &c., to be Named.—*Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be good ones, carefully packed and numbered, and not more than six should be sent at one time. Leaves only, or Florists' varieties cannot, as a rule, be named.*

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

TUESDAY,	AUG. 14.	Royal Horticultural Society. Lecture on Fruit Culture in France, by M. C. Baltet.

SHOWS.

TUESDAY,	AUG. 14	Claycross Horticultural. Taunton Horticultural. Blagdon Horticultural.
WEDNESDAY,	AUG. 15	Cardiff Horticultural (two days). Ancient Society of York Florists' Flower Show. Wilts Horticultural. Cuckfield Horticultural. Sevenoaks Horticultural. Bishops Stortford Horticultural.
THURSDAY,	AUG. 16	Maidenhead Horticultural. Sherborne Horticultural.
FRIDAY,	AUG. 17	Exeter Horticultural. Great National Cooperative, at the Crystal Palace.

SALE.

FRIDAY,	AUG. 17	Orchids, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—62°·5.

Orchid Literature.

IT is only a week or two ago that in announcing the appearance of no fewer than three substantial works of first-class importance from a horticultural point of view, we had occasion to comment on the extent and importance of the literature concerning Orchids. Now, we must add a fourth to the list, for Count OSWALD DE KERCHOVE, the accomplished and energetic President of the Royal Agricultural and Botanical Society of Ghent, has just published his long-expected Orchid Book.*

It forms a bulky volume of more than 600 large 8vo pages, and is illustrated by 310 woodcuts and 31 chromolithographs. To a large extent, as a matter of course, it traverses the same ground as the works previously mentioned, and it has suffered somewhat by the length of time it has been in the press. The delay is not to be wondered at by those who know the demands which political and municipal affairs make upon the time of the author. The book is written by an amateur for amateurs,—we should rather say for connoisseurs,—for those who are not content merely to admire, as all of us do, but who desire also to know; for those who take an intelligent interest in the natural history of Orchids and the many problems connected with it.

The work is divided into three parts: the first treats of the structure and organisation of Orchids, including not only the morphology of the entire plant, but also germination, hybridisation, and classification. In the second part, the economic value and the botanical geography of Orchids are given. The third part is devoted to the cultivation of Orchids, and the enumeration of their friends and foes. In addition, more than seventy pages of two columns each are devoted to a synonymic index of the principal Orchids in cultivation, including hybrids. For this list alone the Orchid-grower has cause to be thankful. In addition, there is a full general index, a table of contents, numerous woodcuts, and several coloured plates. Obviously *Le Livre des Orchidées* fulfils the conditions which ALPHONSE DE CANDOLLE laid down as necessary to constitute a book.

Having indicated the general nature of the contents, not much space is left for comment, and each reader will form his own opinion according to his own predilections and requirements. We may, however, point out that the details relating to floral structure are exceedingly full and very well done, the author having availed himself of the publications of LINDLEY, ENGLER, PFITZER, and other botanists, and having had the advantage of the assistance of MM. COGNIAUX and BERTRAND. It is not, therefore, surprising that the section relating to the morphology of Orchids is unusually well done. Of course there are numerous points which are mere matters of opinion and open to dispute; for instance, we do not think everyone would agree to the statement that a plant with isolated carpels holds higher structural rank than one in which the carpels are united. Nor do we think that many observers will agree that the ovules of Orchids are "bitégumentés." Of special interest, because in horticultural books on Orchids less attention is bestowed upon it than upon the floral details, is the organisation of the stem and leaf. Here the author has followed PFITZER, and although the details are well known to botanists, we commend them to the increased attention of thoughtful cultivators.

As to classification, M. DE KERCHOVE, after alluding to the work of LINDLEY, REICHENBACH, BENTHAM, and other systematists, has adopted the classification proposed by PFITZER, and gives an elaborate table for the determination of the genera. This will be very useful for those who have not access to the original, or who do not read German. This is not the place to criticise PFITZER'S classification; but if Apostasias and Neuwiedia especially, which has three stamens, are to be included among diandrous Orchids, surely Selenipedilum and Paphiopedilum might have been allowed to remain in Cypripedium. The adoption of Paphiopedilum (PFITZER), or as M. DE KERCHOVE writes it, Paphiopedium, for those Cypripedes with duplicate vernation, a three-celled ovary, and a thin seed-coat, is, for horticultural purposes at least, very inconvenient, for if generally adopted it involves the transfer of a very large number of species hitherto placed in Cypripediums to the new genus. Of course we must not complain if it should prove, in the end, that this course is the most consonant with the interests of science. At present we have not arrived at that point, believing that the weight of scientific evidence in favour of the change is not great enough to warrant us in upsetting the balance of convenience in favour of the retention of the old genus with possibly Selenipedilum and Paphiopedilum as sections or subgenera. While Cypripedium is thus dismembered, it is not wonderful that the genera Pescatorea and Bollea should be retained as distinct, though there is now a general feeling that they should be placed under Zygopetalum. But all this is matter of opinion.

The chapter on geographical distribution is very interesting, and gives a good idea of the distribution of Orchids over the surface of the globe, and of the causes influencing it.

The general principles regulating cultivation are laid down briefly, but with a precision and lucidity begotten of practice alike in the Orchid-houses and at the library table, but they are not worked out in detail, nor treated so fully as are the sections relating to structure, classification, and geographical distribution.

Our notice has run to such a length, that we have left ourselves no space for comment on the chapters relating to insect and fungous enemies, but as the discussion of these matters is not specially characteristic of this work, we may pass them over.

Throughout the volume care has been taken to cite the most important treatises on the structure and cultivation of Orchids, so that the book will be a very valuable book of reference for the library of the amateur, and the lover of Orchids generally.

* *Le Livre des Orchidées*, par le Comte O. de Kerchove, de Denterghem, &c., &c. Ghent: Ad. Hoste, Rue des Champs, 47. Paris: G. Masson, 120, Boulevard Saint Germain.

ROSE VISCOUNTESS FOLKESTONE IN MR. RUMSEY'S NURSERY.—The illustration in our Supplement represents some bushes of Rose Viscountess Folkestone growing in Mr. RUMSEY'S Joynings Nursery at Waltham Cross, Hertfordshire, and forming, when in full bloom this year, very charming objects. The variety belongs to the Tea-scented class, and is a hybrid Tea of the late Mr. H. BENNETT'S raising. Its flowers may be described as creamy-pink, centre salmon-pink, large, and very sweet; the foliage large and handsome, and growth vigorous.

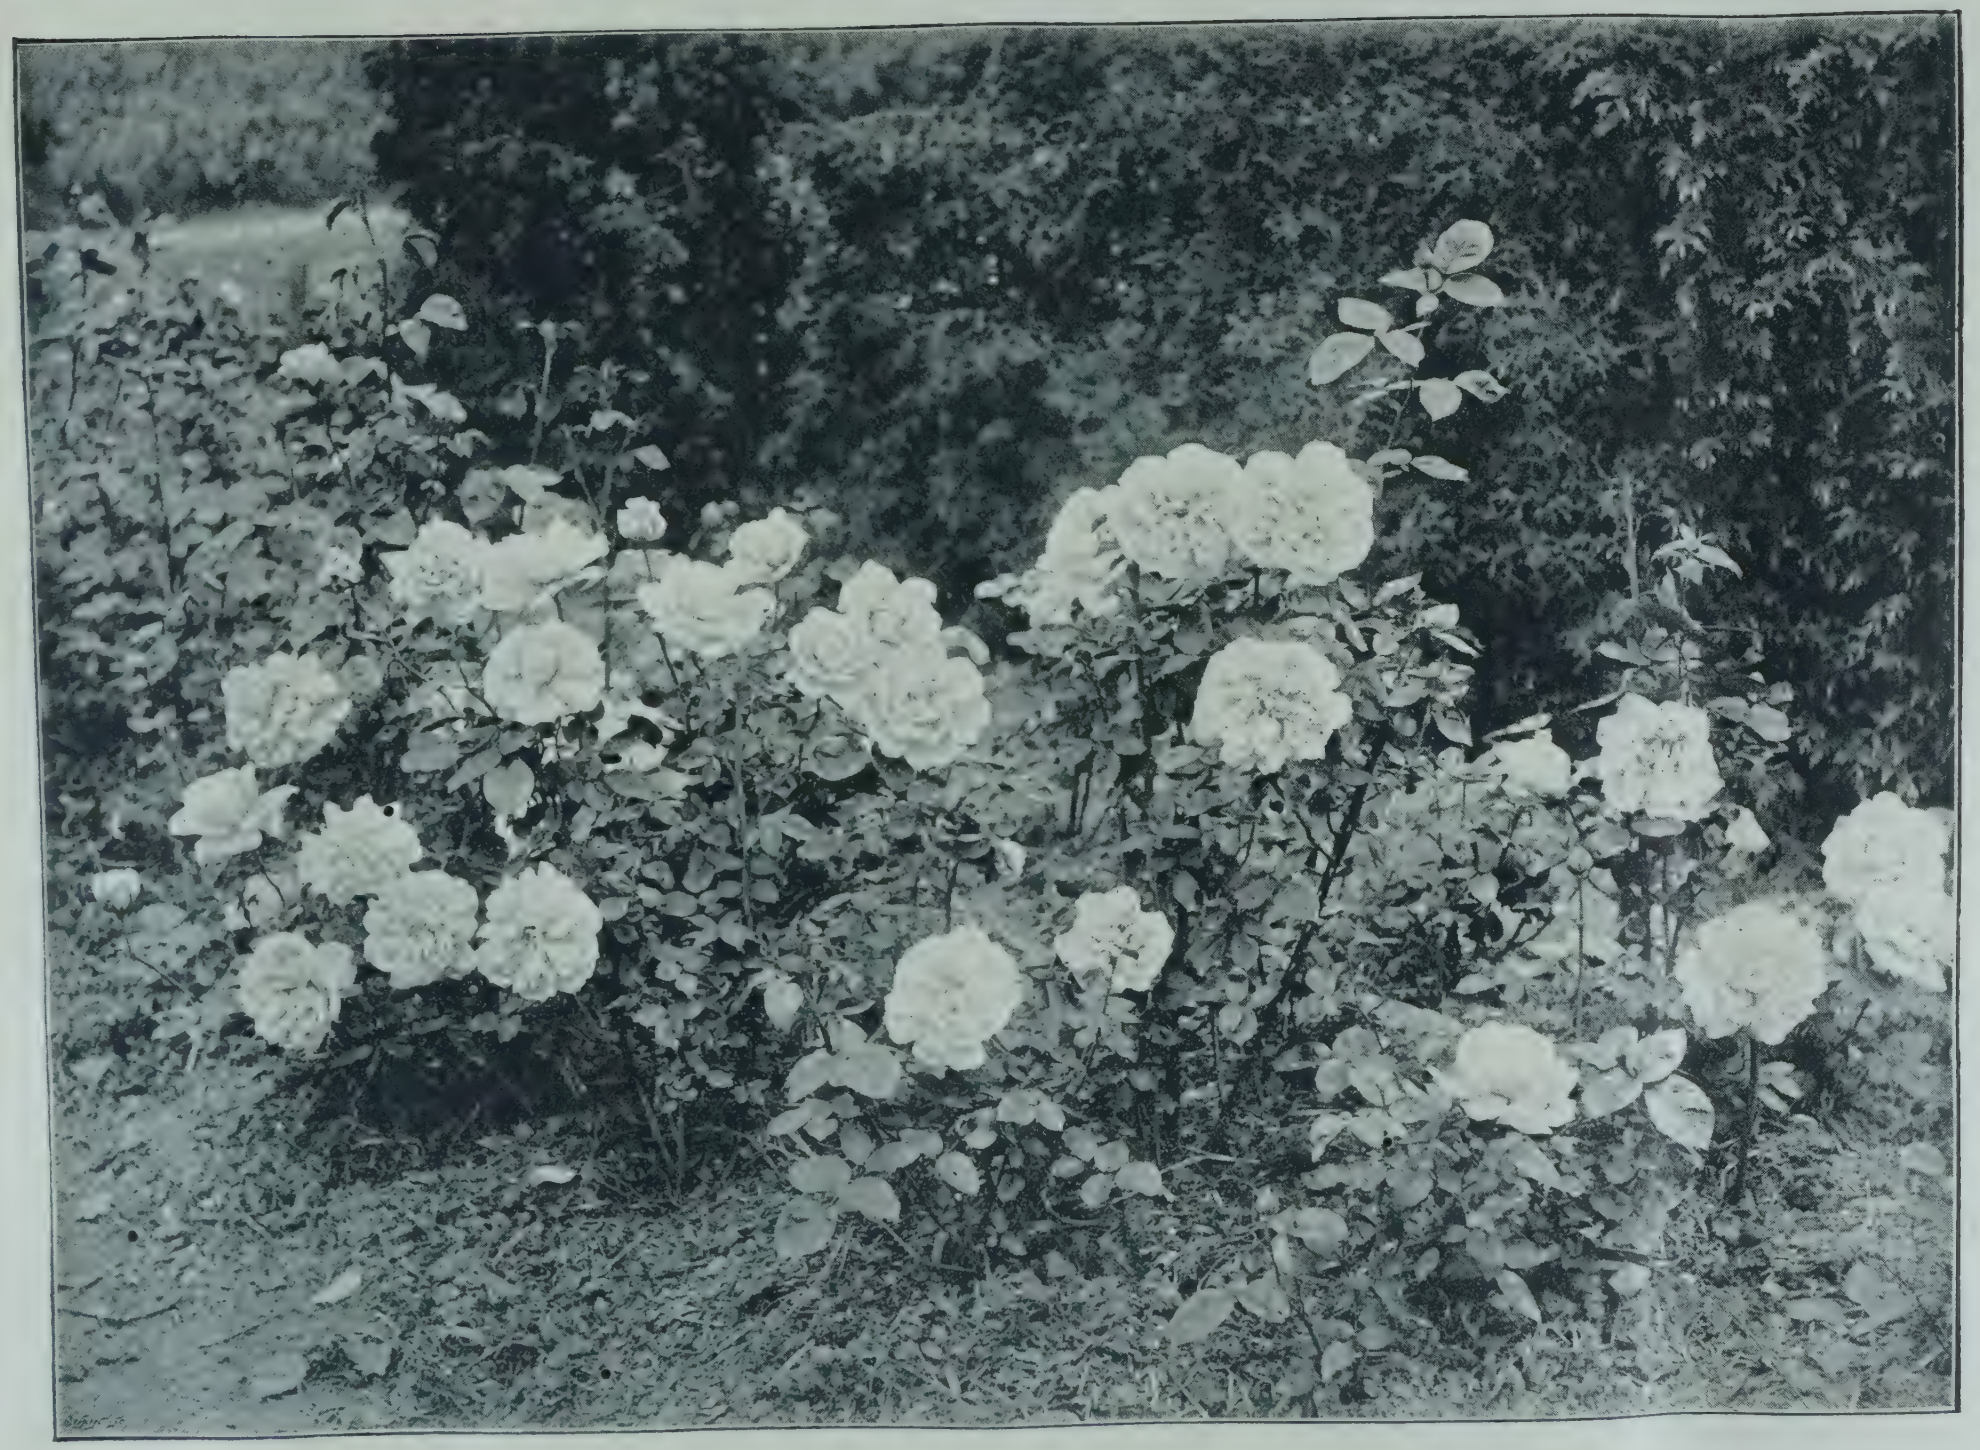
ROYAL HORTICULTURAL SOCIETY.—The next meeting of the above Society will be held in the Drill Hall, James Street, Victoria St., Westminster, on Tuesday, August 14. The Committees will assemble as usual at 12 o'clock; and at 3 P.M. M. CHAS. BALTET, of Troyes, will deliver a lecture on "Fruit Culture in France."

"KEW BULLETIN."—The July number contains articles on the Comino tree of Colombia, a Lauraceous tree called Aniba perutilis by Hemsley. The timber is much valued for constructional and decorative purposes. It can be successfully cultivated at a temperature of 18° to 20° C. Other articles have reference to the cultivation of Vanilla in Tahiti and Fiji. A description of some newly-discovered plants from the Solomon Islands is given. An extract is inserted from the *Standard* of September 16, 1893, on the cultivation of vegetables in this country, and on the importation of vegetables from abroad. In this article one side of the question is treated, but the writer has not availed himself of the very striking facts which were published on this subject in our columns last year, nor does he deal with the very difficult problems connected with markets and the means of distribution.

THE "BOTANICAL MAGAZINE."—The August number is more than usually interesting. It comprises coloured figures and descriptions of—

Leptactina Mannii, t. 7367, a Rubiaceous shrub from West Tropical Africa. Its leaves are opposite, 4 to 5 inches long, oblong acute; the flowers collected in tufts at the ends of the branches. The corolla is pure white, with a slender tube, 4 inches long, expanding into a spreading limb, the five lobes of which are about 2 to 3 inches long, lanceolate, recurved at the tip. Kew, ex Jardin des Plantes.

Neuwiedia Lindleyi, t. 7368, is a Malayan plant of much interest to botanists, as furnishing a link between Orchids and other Monocots. By some it is placed in a distinct order, Apostasiaceæ, whilst Sir JOSEPH HOOKER includes the group under Orchidaceæ. The plant has ribbed lanceolate leaves, and numerous yellow flowers, in erect racemes. Each flower is about an inch long, curved, cylindrical, and separated from the inferior ovary by a short neck or tube. There are three stamens, concrescent at the base, and connate also with the style.



Dermatobotrys Saundersii, t. 7369.—This is a Natal shrub, with opposite, rather fleshy, shortly-stalked, oblong acute denticulate leaves. The shortly-stalked flowers are borne at the ends of the stems; each has a curved trumpet-shaped corolla, about 2 inches long, with a reddish tube, expanding into a flat rotate limb, with five short deltoid yellowish lobes. There are five equal stamens, and a two-

Highclere, the Seat of Lord Carnarvon.

View in the Grounds at Highclere.

Rose Viscountess Folkestone in the Nursery of Mr. W. Rumsey, Waltham Cross, Herts.

A hybrid Tea-scented variety, flowers creamy pink, centre salmon pink, large and sweet.

celled ovary with axile placentas. It is here referred to Scrophulariaceæ, with a mark of hesitation, and might equally well be placed in Solanaceæ. In spite of some obvious differences, it also suggests an affinity with Gesnerads. In any case it is a distinct and pretty stove shrub. Kew.

Veronica amplexicaulis, t. 7370.—One of the dwarf shrubby New Zealand species, with concave oblong leaves and pale lilac flowers. It is hardy at Kew.

Dendrobium atroviolaceum, t. 7371.—A New Guinea species, the perianth segments being yellow, spotted with dull red, and the lip three-lobed, the lateral ones violet, with darker streaks of the same colour. It was described by Mr. Rolfe in our columns, 1890, vol. i., p. 512.

The Natural History of Plants.—The fourth part of Prof. F. Oliver's translation of Kerners' splendid work is before us. It deals with the form and position of leaves with reference to transpiration, the action of the sun's rays, &c. To those who have hitherto only looked on leaves and other members as affording means of distinction between this plant and that, this book will come as a revelation, whilst those who have looked at plants from the point of view of beauty only will now be fascinated by the endless evidences of purpose and adaptation.

"Printers' Ink."—We have received a copy of "Printers' Ink," a small publication also known as "The Little Schoolmaster of Advertising." The booklet is published simultaneously in London and New York (by F. W. Sears), and is, as its sub-title indicates, devoted to the uses and interests of advertising. Much useful advice is given on this subject, and a good idea may be gleaned from it of the progress made of recent years in this particular "art."

Labels.—Mr. C. T. Druery, 17, Gracechurch Street, sends us samples of a very serviceable plant-label made of metal, covered with enamel, on which the name of the plant can be inscribed, together with any remarks that may be desired. Both the label and the inscription are practically indestructible, and the cost is decidedly moderate. The labels can be made of any form or size that may be desired.

Mr. W. Divers.—Owing to the death of his employer, Mr. W. Divers, who for over forty one years has had the charge of the gardens at Wierton House, Maidstone, is now giving up the management of that establishment.

Colutea with Two Pods in a Flower.—In most Leguminosæ one carpel only is present, which ripens into the legume or pod. On theoretical grounds botanists conclude that there should be five carpels, but that four out of the five are abortive. It is not very uncommon to see two pods to one flower in French Beans, and now we have before us two Bladder-senna pods within one calyx, which has a curious effect, the more so as the two pods are bent abruptly upwards as they emerge from the calyx. A Pea or a Bean with five carpels would in some particulars be desirable. Specimens like that before us show that such productions are not impossible.

"Dictionnaire Pratique d'Horticulture."—The French translation of Nicholson's Dictionary, published by Octave Doin, 8, Place de l'Odéon, Paris, has now reached its 27th part, and brings the work to the commencement of the article Gossypium. The numerous additions to this edition render it a desirable book for garden libraries.

Isle of Wight Horticultural Improvement Association.—The monthly meeting of the Society was held at Newport on Saturday, the 4th inst., when a paper on the "Cultivation of Carnations and Picotees" was read by Mr. M. Geddes of Shanklin, who demonstrated the various operations of layering, making cuttings, taking pipings, and the dressing of flowers for exhibition. A good collection of seedling and named varieties of Carnations was staged by Mr. Geddes and Mr. J. H. Silsbury of Shanklin. A discussion ensued. The next lecture will be on the "Geology of the Isle of Wight," by Dr. Groves.

Ayrshire Gardeners' Mutual Improvement Association.—The above Association held their monthly meeting in the Carrick Street Hall, Ayr, on Thursday evening last. Mr. D. Halliday, Cuttican Gardens, presided. An excellent paper on "The Kitchen Garden" was read by Mr. W. M'Connochie, Doonside Gardens, Ayr. Mr. Maxwell, The Knowe, and Mr. M'Lelland, South Park, brought forward exhibits of fruits and flowers. We understand that the next meeting will take place on September 6, when a paper on "The Orchard House" will be read by Mr. Thomas Gordon, Ewenfield Gardens, Ayr.

The Flowers at President Carnot's Funeral.—The number of the *Revue de L'Horticulture Belge* for August 1 contains an article on the flowers used as memorial wreaths and crosses on the occasion of the funeral of President Carnot. The writer says that "From the moment that the news of President Carnot's death reached Paris, the large flower market in the Halles was discontinued. When flowers were priceless there could be no question of traffic in them. Roses vary in value according to the varieties; the most common, Jules Margottin and Le Roy, were selling, previous to June 28, for one franc (about 9d.) a dozen; they rose on Friday, 29, and Saturday, June 30, to three francs; blooms of La France and Brumaire, selling at six francs a dozen, afterwards fetched a franc each. Pansies usually cost about threepence per small box; they were then hardly to be had for sevenpence halfpenny. The principal florists,* who received many orders, went daily, twice in the morning, once in the afternoon, to the nurserymen in the suburbs of Paris. They purchased at the rate of an entire Rose-border, a bed of Marigolds, Marguerites or Pansies, or a house full of flowering Orchids; and paid, without demur, any price that was asked. If they did not decide at once, another comer some minutes after their departure would buy up what they had been bargaining for. Every kind of flower was used for the wreaths—anything that could be got was used. Thus, decorative flowers such as Hortensia or Rhododendrons, which are never used for funeral wreaths, were employed in some of the floral tributes which formed part of the *cortège*, but, naturally, herbaceous plants predominated. Among magnificent trusses of Roses were mingled Petunias, Mignonette, Verbenas, African Marigolds, Begonias, white Lilies, Corn-flowers, China Asters, Pansies, and, above all, Orchids. Most European Sovereigns, the King of the Belgians, Emperor of Russia, Emperor of Germany, &c., sent splendid wreaths of rare and beautiful flowers. We may mention, in addition to these, the wreaths of yellow, white, and red Roses from the French Société Nationale d'Agriculture; that of Pansies, Roses, and Orchids from the Prefects of the Republic; an all-white wreath from the Archbishop of Paris; a tribute of Lilies and Gardenias edged with Passion-flowers, with a central cross of white Orchids; a wreath of Marguerites and Poppies, from the town of Foix; one composed of Roses and white Lilac, across which was thrown a lovely spray of mauve Orchids, offered by the ladies of Geneva; a large flowering Palm from the French colony in Ghent, and many others. Many of these wreaths were of an unheard-of size—many yards round! †

* Our readers can judge of the numbers of orders by this fact: the Emperor of Russia ordered, through his ambassador, M. de Mohrenheim, a wreath costing 8,000 francs, from a leading florist in the Rue Royale. This firm could not undertake the order, having already received more commissions from other customers than could be satisfactorily executed. M. de Mohrenheim then applied to a florist on the Boulevard de la Madeleine, who furnished a wreath for 5,000 francs.

† That from the city of Bordeaux was of Roses and white Lilac, and included a pomegranate-velvet pillow, with an inscription upon it in gold letters. This tribute was raised by a subscription which was limited to a franc for each person. It measured no less than 10 metres (over 32 feet) in circumference, and was all made of flowers, on which were represented in white, the crescents of Bordeaux, and across which was laid a tricoloured flag draped in *crêpe*.

Horticultural Shows.—Reports have reached us of shows at Wells, Somerset, Middleton Tyas, Elsham, Arreton, and Brighstone, Isle of Wight.

Antirrhinums.—Messrs. Laing send specimens of their strain in three colours, one a particularly rich velvety crimson, another canary-yellow with an orange-coloured palate, and a third, a white flushed with a shade of yellow on the palate. The spikes are good and the flowers of moderate size and pure colour.

Bristol Amateur Horticultural Society.—At the invitation of the President (Councillor J. Walls, M.R.H.S.), the members and friends of this Society held their monthly meeting for July in the gardens at Cromwell House, Royal Fort, St. Michaels, when a lecture on Orchids was given by Mr. Wm. Tanser, of Bath, who dwelt on the different species and their habits, and gave valuable advice as to their treatment in the various stages of growth. The lecture was illustrated by some beautiful specimens grown in the gardens.

Sydenham and District.—The Gardeners' and Amateurs' Mutual Improvement Association of the above held their second annual show of flowers, fruit, and vegetables, on Tuesday and Wednesday, July 25 and 26, in a field adjoining Longton Nursery. It was a very creditable show, extensively patronised by the horticulturists of the district, and productive of some capital exhibits.

Belgium.

M. F. KEGELJAN'S GLOXINIAS.

This respected amateur, so well-known for his skilful gardening at Namur, and so highly esteemed by his English friends, has for some days past been showing his Gloxinias to his appreciative friends. It is impossible to describe the beauty, luxuriance, size, and brilliant colouring of some of his specimens. There is one new variety which has attracted much attention, and which will probably be the starting-point of a new strain; it is a large and handsome flower with well-defined longitudinal and parallel lines in the throat. The effect of these stripes is beautiful.

The Peru Heliotrope at Antwerp.

One of the features of the Antwerp Zoological Gardens is the Peru Heliotrope, which, grown from a cutting struck in 1849, has now attained a remarkable size. In height it measures about 6½ feet (2 mètres), has a bushy, conical top, and a trunk nearly 8 inches (30 c.m.) in circumference. The plant is now in full flower, and the perfume is delicious and far-reaching.

Orchids at l'Horticulture Internationale, Brussels.

There are now in bloom at the above-mentioned establishment some fine specimens of Cattleya gigas. Among the varieties is C. gigas triumphans, with a very beautiful and large lip. Beside and below the two yellow spots which are the characteristic feature of gigas, is a large cream-white blotch; this colour also appears on various parts of the amethyst-tinted lip. The general hue of the flower is a beautiful shade of lilac. One C. gigas is noticeable for a lip of unusual size, also for the fineness of the whole flower, which is nearly 10 inches (25 c.m.) across. The plant bears four large flowers on one stem. There are many specimens of C. rex in flower, a hundred in bud. One variety, C. rex var. citrina, has citron-yellow divisions; the lip is chamois-leather coloured, and as peculiar as pretty. A consignment of the rare C. aurea has lately been received. We must mention also a C. gigas with a pretty lip and unusually dark colouring. Very beautiful also are C. Eldorado Leopoldi, C. virginalis, and C. crocata. Catasetum punctatum is flowering for the second time; there is also a species of Lycaste, with greenish flowers, growing like a Cattleya citrina. There are hundreds of seedling Cypripedium, Cattleya, and other species growing well.

Treatment of Imported Orchids.

It is known that imported Orchids are treated at l'Horticulture Internationale on a different plan to that pursued in England. In Brussels they are potted as soon as unpacked, and water is given plentifully. This suits them well, and they soon begin to grow. In proof of this, it may be instanced that six weeks ago the collector, Roebelen, from l'Horticulture Internationale, helped to unpack a fine Vanda Sanderiana (V. Esmeralda Sanderiana) with three stems, one 3 feet, another 2 feet, the third 1 foot high. Twenty minutes after being unpacked the plant was potted, contrary to the advice of the collector. Since then, this Vanda has not only never lost a leaf, but two roots, one about $\frac{1}{50}$ inch (17 mills.), the other $\frac{1}{125}$ inch (8 mills.) in length, testify to the perfect healthiness of the vegetation. *Ch. De B.*

BROOK HOUSE, ISLE OF WIGHT.

The resident owner of Brook House, Charles Seeley, Esq., M.P., is a gentleman well-known for his generosity to the poor, and for his efforts for the education and amelioration of the condition of the people in the Isle of Wight, and also in parts of Nottinghamshire, where he possesses extensive collieries. Brook House is situated in large and well-kept grounds, which are managed by Mr. W. Tribbick, the gardener. The place is 9 miles from Newport, and 3 from Ringwood, the nearest station.

In most large gardens something is made a specialty of, but here everything is equally well done. The pleasure-grounds are extensive, and undulating, the beltings and beds of shrubs arranged with good taste, and contain a number of pools, the water passing from one to the other by circuitous rocky channels, the crevices of which afford places for alpine plants and creepers in variety. Among Conifers noted are Cedrus deodara, C. atlantica, C. Libani, Abies Nordmanniana, A. Pinsapo, A. Loweana, Picea pungens glauca, Cupressus macrocarpa, C. erecta viridis, Pinus excelsa, P. insignis, P. Strobus, Retinospora plumosa aurea, Cryptomeria elegans, C. Lobbii, Taxus baccata, T. b. aurea. Kalmias, Weigelas, and Syringas are found in variety; Veronica Traversi is a mass of bloom just now, and Diplopappus chrysophyllus and Olearia Haastii show an abundance of flower. The Sycamore, Beech, Chestnut, and Oak are grown in much variety.

The fruit garden, a large tract, with a S. by S.W. aspect, enclosed on two sides with a wall about 12 feet high, and on the remaining sides by the vineries, greenhouses, &c., contains hundreds of pyramids and bushes of various fruits, as well as many wall trees. The best crops of Apples are found on King of the Pippin, White Juneating, Irish Peach, Keswick Codlin, Warner's King, and Tower of Glamis. Seventy varieties are grown.

The Plum trees, which consist of thirty varieties, are carrying heavy crops, especially Kirke's, Autumn Compote, White Magnum Bonum, Coe's Golden Drop, Diamond, Prince Englebert, and Jefferson.

Out of eighty varieties of Pears, the following are bearing well, viz., Beurré Hardy, B. Diel, Doyenné d'Alençon, D. du Comice, Louise Bonne of Jersey, Thompson's, Pitmaston Duchess, Williams' Bon Chrétien, Dr. Trousseau, Gansell's Bergamotte, and Alexandre Lambre.

The Strawberries, Gooseberries, Currants, and Raspberries, are excellent, which is more than can be said of bush fruit in general in the island.

The forcing-houses bear testimony to the ability of Mr. Tribbick and his foreman, Mr. J. Rawles. Ten of the Peach trees, which have been planted about twenty years, cover a space of 3000 square feet, and are carrying about 3000 fruits, which, according to present appearances, will be large and fine. The following varieties are among those cultivated, viz., Bellegarde, Alexandra, Noblesse, Grosse Mignonne, Walburton Admirable, Barrington, Dr. Hogg, Stirling Castle, and Princess of Wales; and the Nectarines are Humboldt and Pitmaston Orange.

In the vineries are good crops of Grapes, particularly of Black Hamburgh and Muscat of Alexandria, the bunches large, and of good shape; the berries well-coloured.

In the stoves were noted plants of Allamanda, Stephanotis, Anthurium, Bougainvillea, Croton, Dracæna, Gloriosa, Sarracenia, &c. Eucharis amazonica is a fine stock, free from insects, and the leaves of a glossy green colour; they are flowered chiefly in the winter season.

Orchids are represented by Cattleya, Vanda, Lælia, Odontoglossum, and Cypripedium, the collection of the last-named being the finest in the island. Ferns and greenhouse plants are largely and well cultivated. The kitchen garden and other departments are as well-ordered and managed as the glass-houses and fruit garden. *S. Heaton.*

AN ONION DISEASE.

Examples of diseased Onions, sent to this Journal for identification, prove that we have to struggle with yet another pest, belonging to a small group of fungi that have become specially adapted for leading a parasitic life on certain groups of flowering plants. The great interest of these fungi, from a purely scientific point of view, has resulted in a very thorough knowledge of their structure and life-history; and although the scientific investigator will probably get but small thanks for his labour, nevertheless the knowledge at command will enable the Onion-grower to avoid losing his crop, by attacking the fungus at the weak point in its life-cycle.

Fig. 25.—Sclerotinia bulborum.

1, The Botrytis-stage of the fungus, growing on an Onion-leaf (magn. 100); 2, tip of branch of same, bearing conidia (magn. 400); 3, Ascophore-stage, growing from a black sclerotium, marked ×; 4, Ascus, containing eight spores of the Ascophore-stage; 5, two Ascophores (magn. 400).

The fungus belongs to the Peziza group, characterised by having a cup-shaped fruit, usually supported on a stem; its name is Sclerotinia bulborum, Wakker, and it was first observed on Hyacinths near Amsterdam. The first indications of the disease appear under the form of small yellowish blotches on the leaves in spring; these blotches gradually increase in size, become brownish, and covered with a very delicate velvety olive-brown mould. This is the Botrytis stage, fig. 25, 1, and enables the fungus to spread rapidly; the conidia, fig. 25, 2, are formed in immense numbers, and germinate at once, so that when a single plant is attacked, the disease spreads very quickly, the conidia being conveyed to neighbouring plants by wind, rain, &c.

During the formation of conidia, the mycelium or spawn of the fungus is increasing in quantity in the tissues of the Onion leaves, and gradually growing downwards into the bulb; when this point is reached the spawn forms itself into numerous compact lumps, varying in size from that of a Rape seed to that of a Pea. These bodies, called "sclerotia," are black externally, and continue to increase in numbers until, in severe cases, they form a compact crust, fig. 25, 3×, on the surface of the rotting bulb. These sclerotia or compact masses of spawn remain in the soil in a resting condition during the winter, and on the return of spring each sclerotium produces one to three of the stalked, cup-shaped structures known as the ascophore stage of the fungus, fig. 25, 3. Finally, the spores produced by the ascophore are carried on to the young Onion leaves, where they germinate at once, enter the tissues, and produce in turn the Botrytis stage.

The weak point of the disease is the Botrytis stage, developed pretty early in the season on the leaves; the fruiting stem of the mould being produced on the surface of the leaves can be readily seen if specially looked for, and on the first indication of the disease the entire crop should be sprayed with a rose-red solution of permanganate of potash, or a dilute solution of Bordeaux Mixture; the addition of 1 lb. of soft soap to 5 gallons of either of the solutions mentioned is an improvement. If the Botrytis stage is allowed to spread, there is no hope of saving the crop, and where the sclerotium stage of development has been reached, the diseased bulbs, along with the soil immediately surrounding them, should be burnt, because if allowed to rot in the ground, the sclerotia would produce fruit the following spring, and form the starting point for a new centre of disease.

The same or a very nearly related fungus has done much damage to Lilies of late years, Lilium candidum and L. longiflorum being especially subject to its attacks. The Botrytis stage attacks the leaves and also the flowers, and if allowed to proceed undisturbed the sclerotia are formed in immense numbers in the bulb, and sometimes also in the decaying stem. Syringing with the solutions mentioned above, if applied sufficiently early, will completely arrest the disease. *G. Massee.*

THE HERBACEOUS BORDER.

TROPÆOLUM POLYPHYLLUM.

This is one of the most beautiful and charming of choice herbaceous plants. It is so perfectly hardy, and so easily suited to almost any and every condition of soil, that a home should be found for it in every garden. Indeed, were its beauty and graceful bearing more generally known than is apparent by its rather rare occurrence in gardens, I am sure it would be much more frequently seen. Once planted, it will root deeply, and spring up annually in increased vigour and quantity, its long tresses of glaucous leaves being densely studded with golden-yellow blossom. So perfectly hardy and vigorous is it, that it will readily force its way through a very firm gravel path, a fact which may be doubted by a stranger on first finding its young shoots. By far the best position that can be given it is one rather high on the rockery, where its beautiful tresses of golden flowers may trail just where they please, and thus display itself to good advantage. Any interference in staking it up, even supposing it were planted in the ordinary border, means simply to spoil one of the most charming of all hardy trailing plants. The plant is tuberous-rooted, and may in season be had quite cheaply in a dry state. One of the most sumptuous displays I have ever seen was a huge bank, 50 feet long perhaps, in the Hale Farm Nurseries, some years ago. It was in full flower, and was truly a most glorious sight. *J.*

Lychnis Haageana.

Under this head we have one of the most beautiful as well as the most varied groups of choice and dwarf perennials. Though only attaining in a general way from 1 to 1½ foot in height, the plants are very freely flowered, and continue a long time in good condition. In general appearance they are widely distinct from the rest of this group, both in habit and flower. The latter frequently embrace some of the most vivid shades of scarlet, vermilion, rose, salmon-red, and crimson, together with many varying and intermediate shades. Whites are also found, though I have never seen a thoroughly good and pure white flower. In flower the plants are very showy, on account of the large size of the individual blossoms. These frequently approach 2 inches in diameter, and when seen in compact bushes, embracing the more distinct and brilliant

hues, are very striking. The plants are usually of easy culture, giving preference in point of soil to rich sandy loam of fair depth. In clayey soils the plants are not so happy as in light warm soils; indeed, it seems hardly possible to have a position either too dry or too hot, in proof of which I may mention that I planted some strong tufts immediately beneath a bay window having a south aspect, and I have rarely seen the plant attain to greater luxuriance. Not only was the position excessively hot in summer, but it was also very dry by reason of its closeness to the foundation of the dwelling. Those of your readers having similar positions, and who are at a loss how to brighten them, may do well to embrace a few of these Lychnises. They are easily raised from seeds, which are produced in plenty. The process, however, is rather a slow one, and those desiring immediate effect would do better, perhaps, to purchase a few plants of decisive colours, established in pots; good plants may be had from dealers in hardy plants at quite a cheap rate. *J.*

Geranium Endressi.

A neat and effective plant, suitable alike for the large rockery, or as a front-row plant in the border. In its flowering it is extremely free, the pretty rose-pink flowers, with which the plant is smothered throughout the livelong summer, producing a very pleasing effect. The plant usually grows about 2 feet high, and makes itself contented in any soil or position, and may be increased by division to any extent. *J.*

THE MANOR HOUSE, ASHBY-DE-LA-ZOUCH.

Our illustration (fig. 26) shows a view in the garden of W. Hemsley, Esq. In the foreground are carpet-beds. A crescent-shaped bed filled with sub-tropicals is further back. The ruined castle dates from the 15th century, and occupies the site of a castle that will be remembered by all readers of *Ivanhoe*. It is a matter of opinion whether this style of formal gardening is congruous with ruined architecture; but in any case, the effect of contrast is striking, and highly appreciated by the many visitors, and does much credit to Mr. Curtis, the gardener.

Fig. 26.—Manor House, Ashby-de-la-Zouch.

Home Correspondence.

Small nuts.—There is this year what in sporting parlance may be termed a record crop of small nuts. Not that good crops of these pleasant fruits are not common, but at least this year there will probably be one of unusual abundance. That should be good news for the vegetarians, for they hold that our molars are especially intended for the cracking of nuts and other frugivorous products, and that the more of work we give them the better for them as well as for human health. Man and monkey are very much alike in their appreciation of sweet nuts, and capital food they are also. Were our markets dependent upon the fruit of the common Hazel, possibly our fondness for nuts might be less of an enthusiastic kind; but now that we have such a wealth of Filberts and Cobs, the fruits so fine, clean, and sweet, it is not a matter for surprise that we have never found them overdone, nor is it at present probable that they will be. Our home growers have even found a capital market for their produce in America, and if the Yankee sends us Apples amongst other fruits, we can now send him small nuts in exchange. Thus both nations are benefited. That there will be an immense crop of Kentish Cobs is evidenced by the statement of one grower that he expects to gather so enormous a weight as two tons to the acre. An average good crop would be about 30 cwt., but the pecuniary return is consequent on price, hence only problematical estimates can be made. That small nuts of the finest quality will be presently much cheaper than usual there can be no doubt, and no fruit can be more safely purchased for keeping, for good nuts may be kept fresh for several months. In Kent, which is the great nut county, it by no means follows that two tons or even 30 cwt. per acre of produce represents the entire production of the land. There Apples in the form of standard trees are unusually associated with the nuts. This year the fruit of the former will be few, and therefore the lack of crop will have to be largely made up for by the great abundance of nuts. In that county too, small nut culture is, as it were, reduced to a science, The cup-shaped outline is that favoured, and that it is productive of fine crops there can be no doubt. Still further, it is a method of culture best suited for intermingling with Apples. It does not, however, follow that good Cobs and Filberts may not be grown in a less formal fashion. Few gardeners get from free-grown trees or bushes, that are all tops rather than bottoms, finer crops than does Mr. Turton at Maiden Erlegh, and he seldom has a blank season. The soil is stiff, but the nuts thrive well upon it. They are somewhat sheltered by tall trees from the east, certainly. Considering that the small nuts blooms chiefly in January and February, there can be little doubt but that the bloom is of the hardiest. That the present splendid nut crop is largely due to the thorough ripening of the shoots last year there can be no doubt. The chief failures come after cold wet summers. Still, there can be no doubt but that the average cropping capacities of nuts are as high as are those of most fruits, hence taken all round it does seem as if few hardy fruits were more profitable or better worthy of extended cultivation. *A. D.*

Tropical plants at home.—There is probably no gardener living who would not be both charmed and educated by a series of good photographs of tropical plants and scenery. Engravings and lithographic reproductions are useless; the former are not botanically correct, nor do they convey the true feeling required, and the majority of lithos are simply a libel on Nature. There are photos, and good photos, of nearly everything in creation, from that of the house in which the last murder was committed to a seascape illuminated with the sails of fishing smacks advertising Teachem's pills; but where are the photos of Nature at her best? The *Gard. Chron.* gives us pictures of things and places which most of us can see every day, but where is the enterprising soul who will give us such pictures of tropical Nature as Stoddard's reproductions of things in general, which

are now being issued wholesale at a cheap rate? Surely some of those who have the power will rise to the occasion. The lovers of gardening and Nature at her best are not so small a minority as to make such a venture a failure commercially. *Thos. Fletcher, Grappenhall, Cheshire.*

TUBEROSE PEARL.—Is it a common occurrence for the Tuberose Pearl to throw two and three flower-spikes from a single bulb, which carry from twenty to twenty-six flowers on each? I have several bulbs which are flowering to that extent this season. The bulbs were potted to the number of two in a 5-inch pot, and are very strong. *E. Preece, Brewery House, Lowestoft.*

LILIUM ELEGANS CRUENTUM OR HORSMANNI.—Mr. Wallace, at p. 135, says he does not know when I received my L. Thunbergianum (elegans) cruentum. I bought at a sale, March 27, 1882, two lots together, seventy-five bulbs. I do not remember to have seen the Lily before these flowered. The note in my garden book is "richest dark elegans." Neither L. e. cruentum nor L. e. Horsmanni are mentioned in M. Cannart d'Hamale's *Monographie des Lis*, published in 1870, nor in Mr. Elwes' *Monograph*, part v., August, 1878. There were a good many lots similar to those which I bought, so that a large number of these Lilies must have been put into circulation. Perhaps Mr. Ware, or some other large Lily buyer, can give some account of them. I see by your editorial note, p. 74, that L. Thunbergianum (elegans) cruentum was certificated July 11, 1882. Should any of your readers have correspondents in Japan, and try to get L. e. cruentum in quantity, I would recommend them to try also for L. e. atrosanguineum; this is not so dark as L. e. cruentum, but with a bright warm tinge, it is very handsome. *George F. Wilson.*

A WORD ON THE NARCISSUS GRUB.—Now that cultivators of Narcissus are lifting their bulbs for transplanting, a word on the Narcissus grub may not be amiss. Without entering into the history of the fly and grub, I may mention a simple method I have often used to rid an infested bulb. This is to steep the bulb—that has been pierced at the base and in which you are certain the enemy has taken up his winter quarters—in a weak solution of salt and water. Generally in eighteen to twenty-four hours you will find the grub has left the bulb and may be seen in the water. When I say that the grub may become at times as great a pest as basal-rot, it is well to have a simple plan of riddance. *W. Crawford, M.D., Uddingston.*

LIGHTNING AND THE POTATO DISEASE.—"E. C.'s" assurance that the Potato fungus is the product of lightning shows how very hard popular superstitions die. He might with as much wisdom have attributed the Onion-maggot or the Gooseberry-caterpillar or the spider to the same cause. What happens is that thunderstorms are almost invariably accompanied by either rain or followed by a very humid atmosphere, which saturates the Potato leafage as would a bath of vapour. The minute spores of the Phythophora infestans being then abundant in the atmosphere or on the Potato plant leafage, held there probably by the minute hairs which cover the leaves, no sooner become thus immersed in moisture than they become active, causing rapid growth in the leafage, which destroying the cellular tissue, causes the black spot seen on the leafage. It is very common experience for a breadth of Potato to seem full of rude health in the evening, and next morning after a humid hot close night to be covered with black spots. I have often found vaporous exhalations or mist to be far more productive of spore growth than is rain. I mentioned some time since seeing at Reigate so early as July 6th, in a low-lying damp locality, a breadth of Beauty of Hebron, of which the leafage was badly affected with disease. That was in the morning, and in the evening a very heavy thunderstorm visited the district. Possibly some persons would in that case have attributed the disease there to the lightning, which if it were of that disastrous character ascribed to it by "E. C." would, because it was most remarkable in its intensity, have blackened all the Potato-tops in the district. That the fungus attacks the more mature leafage first is well known, but has not been explained. *A. D.*

THE CRYSTAL PALACE FRUIT-SHOW.—There appear to be many fruit-growers in the kingdom who do not seem to be aware that the schedule of this show has been issued by the Royal Horticultural Society. From the copy before me I gather that there are over 140 classes, and all of a character to attract good competition, and bring together a wonderful body of splendid fruit. That it should eclipse all other similar efforts in the way of fruit displays is certain, if liberally supported. A few defects have already been criticised. First, that the show extends over four days, inclusive of Sunday; that may deter many private growers from exhibiting choice fruit; still, were it possible to have the whole of the choicer or softer fruit covered up during Sunday and at night, if but with papers, great good would result. Again, the temperature of the Palace is never high, and its atmosphere is pure, so that fruit will take much less harm than two days' exposure only in some other places. Then some have said the prizes are not large enough; still, they are not bad; and, best of all, owing to the great number of classes, they give chances to very many competitors, instead of to the few. There are no fewer than seventy-five single-dish classes for Apples and Pears which shows how open is the competition. A fault, too, has been found with the interleaving of advertisements with the prize-list. That is always an objectionable practice; but as the advertisements are all on separate leaves, the nuisance is soon got rid of. I am satisfied that this is an illustration of the way in which advertisers in their demand for particular places entirely overshoot the mark. Advertisements at the beginning or end of a schedule remain, those in the middle of a schedule don't. In spite of any small defects, the exhibition promises to be one of the finest fruit shows ever seen, and there can be no doubt that it will be so. I think 5*s.* per head for a gardener's luncheon is an exorbitant charge, as it is notorious the contractor would make a good profit out of 2*s.* 6*d.* per head. *A. D.*

SOCIETIES.

SMETHWICK HORTICULTURAL.

July 25.—The seventh annual exhibition of this society was held in the Victoria Park on the above date. Through the interest and energy of the Rev. George Astbury, the vicar, and a hard-working Committee, the show has flourished from the beginning, and is a source of enjoyment to thousands who dwell in the immediate neighbourhood, being close to Birmingham. The neighbourhood has some good gardeners, who exhibit plants at the show. Some fine specimens of Dipladenia amabilis, Stephanotis floribunda, Clerodendron Balfouri, and Statice profusa, Ericas and Phœnocoma prolifera Barnesii were shown by the local gardeners; also some good Cycas revoluta, Crotons, and Palms.

In the competition for the best groups there were eight exhibits, and so good were they considered that six prizes were awarded.

Cut flowers made a good feature, and although Smethwick is only a few miles from Birmingham, 104 bouquets of wild flowers were exhibited, gathered, and arranged at the various schools, in the presence of the teachers. Fruit and vegetables were good, and as many as twenty-six collections of the latter were staged by amateurs and cottagers chiefly. The society is in a good financial position.

SOUTHAMPTON ROYAL HORTICULTURAL.

August 4, 6.—The floral fête of the above society was held in Westwood Park on Saturday and Monday. The weather was very threatening in the morning, but it held up sufficiently to secure a good attendance of visitors, although rain fell smartly in the afternoon of the first day.

The floral portion of this show is held in connection with an extensive programme of sports, the latter taking place on the second day (Bank Holiday), and in both sections of the programme, especially the horticultural one, the prizes offered were more numerous and of more value than is usual. Throughout the arrangements were very satisfactory, and reflect great credit upon the secretary, Mr. C. S. Fuidge.

Special mention may be made of the plants and groups; while if cut Roses were not so numerous as usually seen at this show, the quality compared favourably with any that we have seen at exhibitions this season. Messrs. Keynes & Co. had a fine lot of flowers not for competition—dark varieties—and these flowers, as well as the premier stands of Roses from Messrs. Perkins & Son, Coventry, were very clear and bright looking.

OPEN CLASSES.

Plants—These were excellent, especially those of the stove and greenhouse section.

For ten stove or greenhouse, five to be in bloom and five foliage, distinct: 1st, Mr. J. Cypher, nurseryman, Cheltenham, with grand specimens of Erica tricolor vera, Croton Sunset, Statice profusa, Allamanda nobilis, a beautifully grown and coloured Croton Chelsonii, and three grand Palms—Kentia australis, Latania borbonica, and Kentia Fosteriana. The last three, and a Phœnocoma prolifera Barnesii were specially noteworthy. Mr. T. Wilkins, gr. to Lady Theodora Guest, Henstridge, Blandford, was 2nd, with a collection which contained the largest Latania borbonica we have seen outside of Kew Gardens; well-grown Ixora Williamsii, and Kalosanthes coccinea major, also deserved attention. 3rd, Mr. F. C. Jennings, gr. to W. Garton, Esq., Roselands, Woolston. Mr. Jennings was close up to the 1st and 2nd prizemen, but there was a great falling off in the other competitors.

For six stove and greenhouse, three in bloom and three for foliage, Mr. J. Cypher again led the way. Ixora Pilgrimii being his best. Mr. Jennings 2nd, beating Mr. Wilkins in this instance.

In a collection of six miscellaneous plants, not less than three to be in bloom: 1st, Mr. N. Blandford, gr. to Mrs. Haslefoot, Moor Hill, West End, with splendid specimens of Cycas circinalis and Croton Morti; Mr. Peel, gr. to Miss Todd, Sidford Lodge, Shirley, and Mr. T. Hall, gr. to Sir S. Montague, Bart., M.P., equal 3rd; the contest being close indeed.

Six stove or greenhouse Ferns were not particularly striking: 1st, Mr. Jennings, gr. to W. Garton, Esq.; 2nd, Mr. J. Amys, gr. to the Hon. Mrs. E. Yorke, Hamble Cliff.

For a specimen stove or greenhouse plant in bloom, Mr. Cypher led with a small but well-flowered Erica Austiniana, and Mr. Jennings, was 2nd, with Allamanda Hendersoni.

For a specimen foliage plant, Mr. Evans, gr. to Lady Louisa Ashburton, won with a good Cycas revoluta; Mr. Jennings following with a very deep-coloured Croton Williamsii.

For a specimen Palm (Latanias excluded) Mr. J. Amys, gr. to the Hon. Mrs. Eliot Yorke, Hamble Cliffe, and Mr. Jennings, gr. to W. Garton, Esq., Woolston, were 1st and 2nd.

Groups of miscellaneous plants were the best it has been our lot to see this season. All were beautifully arranged, no overcrowding, and with a light feathery effect. Much of this was attained by the free use of Francoa ramosa, Asparagus, and various Orchids, Oncidium incurvum being particularly pleasing. 1st, Mr. E. Carr, gr. to W. A. Gillett, Esq., Fair Oak Lodge, Bishopstoke, with an excellent group in the chief class, followed by Mr. E. Wills, nurseryman, Winchester Road, Shirley; and Mr. T. Wilkins, gr. to Lady Theodora Guest, Inwood House, Hunbridge, was 3rd.

For a smaller group (12 by 8 feet), well arranged collections were also put up. 1st, Mr. Peel, gr. to Miss Todd, Sidford Lodge, Shirley, with a good group, followed by Mr. Hall, gr. to Sir S. Montagu, Bart., M.P., and Messrs. Longster Bros., Nurserymen, St. Mary's Road.

Mr. E. Wills, Nurseryman, Winchester Road, Shirley, was 1st for six Begonias, Mr. J. Hughes, gr. to W. Baring, Esq, Norman Court, Dean, following. But for four double ditto, Mr. Hughes was well in front of his rival.

The contest for a collection of Orchids brought out three competitors. Mr. E. Carr, gr. to W. A. Gillett, Esq., who was 1st with some very pretty little pieces of Epidendrum vitellinum majus, Anguloa Clowesii, Cypripedium barbatum majus, C. Laurenceanum and Oncidium incurvum; and Mr. N. Blandford, gr. to Mrs. Haselfoot, Moor Hill, West-end, who was 2nd; and Miss Todd, Shirley, 3rd. Mr. Carr was likewise 1st for a specimen Orchid.

For four double-flowered Pelargoniums.—1st, Mr. G. Windebank, nurseryman, Bevois Mount; Mr. J. Stratton, nurseryman, Shirley, occupying a similar position for four Zonals.

Mr. Hall, gr. to Sir S. Montague, Bart., was well in front for six Coleus, having beautifully grown and coloured specimens, and was also 1st for six Cockscombs; and Mr. R. C. West, gr. to H. J. Wigram, Esq., Northlands, Salisbury, was 1st for six Celosias.

Six plants suitable for table decoration brought some well-grown stuff, Mr. Webster, gr. to E. J. Preston, Esq., Kelsey Park, Beckenham; Mr. Peel,

gr. to Miss Todd; and Mr. E. Wills, nurseryman, Winchester Road, Shirley, being winners in the order of their names.

Roses were good but not numerous. Messrs. Perkins & Sons, nurserymen, Coventry, were 1st for twenty-four varieties. This was one of the most perfect stands which we have observed during this season. Messrs. Keynes, Williams & Co., Salisbury made a good 2nd.

Twelve blooms (amateurs) were also good and clean: 1st, Mr. W. Neville, gr. to F. W. Flight, Esq., Cornstiles, Twyford; 2nd, Dr. D. Seaton, Rutland Lodge.

In a class for twelve bunches of hardy flowers: 1st, Mr. B. Ladhams, Nurseryman, Shirley, with a capital lot, having fine Coreopsis, Gaillardias, &c., and some blooms of a very showy new hardy Gladiolus, "La Fayette," which attracted much attention. Mr. Evans, gr. to Lady Ashburton, was 2nd. Mr. Evans was 1st for twelve bunches of cut flowers, followed by Mr. Henbest, gr. to E. B. Marshall, Esq, Crawley Court, Winchester. Mr. W. Baring, Norman Court, Dean, had the best twelve Carnations.

In the open class for twelve Show or Fancy Dahlias, and also for twelve Pompones, Messrs. Keynes, Williams & Co., Salisbury, and Mr. J. Evans, took the 1st and 2nd prize in the order of their names.

Fruit.

There were several splendid collections of fruits, and the quality was generally very good. For six dishes: 1st, Mr. H. W. Ward, gr. to the Right Hon. Earl of Radnor, Longford Castle, Salisbury; 2nd, Mr. J. Evans.

Dishes of Grapes were numerous, and of much excellence. For three bunches of black Grapes: 1st, Mr. W. Mitchell, gr. to J. W. Fleming, Esq., Chilworth Manor; Mr. J. Sanders, gr. to Miss Shelley-Bontein, Paulton's Park, was 1st for three bunches of white Grapes.

Mr. R. C. West, gr. to H. J. Wigram, Northlands, Salisbury, was 1st for two bunches of black Grapes; and 2nd, Mr. T. Wilkins, who was 1st for a like number of bunches of white Grapes.

For six dishes of fruit, outdoor growth: 1st, Mr. R. C. West; and 2nd, Mr. J. Evans. For a similar number of hardy fruit from amateurs: 1st, Mr. W. Fellows, Hill Lane; being closely followed by Mr. F. M. Vokes, Sholing.

Vegetables.—Here also there was strong competition, and first-class produce was shown. In the open class for nine distinct kinds: 1st, Mr. T. Wilkins, and Mr. Pope, gr., Highclere Castle, was 2nd.

In the class for six kinds (amateurs): Mr. A. R. Bone, Portswood, and Mr. W. Batten, Old Basing, took 1st and 2nd.

Messrs. Sutton & Sons' 1st and 2nd special prizes went to Mr. J. Hughes, gr. to W. Baring, Esq., and Mr. Pope, gr. to the Earl of Carnarvon. The 1st and 2nd, by Messrs. Webb & Son, to Mr. W. Pope and Mr. T. Wilkins, gr. to Lady T. Guest; and the two premier prizes, by Messrs. Toogood & Sons, to Mr. W. Wiltshire, jun., Westend, and Mr. Vokes, Sholing.

Non-competitive exhibits were numerous and varied, the most notable being a special tent and stand of horticultural sundries, seeds, &c., from Messrs. Toogood & Sons, Southampton. A collection of choice plants and Carnations came from Messrs. Cutbush, Highgate. Conifers, flowering shrubs and herbaceous plants were shown from Mr. E. Hillier, the Nurseries, Winchester; and Roses from Keynes, Williams & Co., of Salisbury, attracted much attention.

Mr. J. Douglass, "Edenside," Great Bookham, had a good collection of Carnations and Picotees.

THE MIDLAND CARNATION SHOW.

August 5.—This exhibition, which was held in the Edgbaston Botanical Gardens on the above date, proved, like that in London, a distinct success, flowers coming from many parts of the country, and being generally well shown. The border varieties, shown in bunches, were very numerous, though some of them were unduly large. The selfs and fancy varieties, together with the yellow grounds, were seen in their best form.

The best twelve Carnations came from Mr. R. Sydenham, Birmingham, who had Fred Phillips, Lord Salisbury (a very fine C.B.), Mrs. Rowan, Guardsman, Joseph Laken, Sarah Payne, &c.; the 2nd prize going to Messrs. Thomson & Co., Birmingham, who also had some very good blooms.

Mr. B. Simonite, Sheffield, had the best six blooms; Mr. J. Edwards, Manchester, came 2nd.

Picotees were very good, Mr. A. W. Jones, Birmingham, being 1st with Little Phil, Esther, Brunette, Ne Plus Ultra, Mrs. Burnett, Thomas William, Lady Louisa, Mrs. Sharpe, Muriel, and Favourite; Mr. R Sydenham taking the 2nd place.

With six varieties Mr. C. Chappell, Lozells, was 1st; and Mr. B. Simonite 2nd.

The best twelve yellow grounds or fancies came from Mr. Charles Turner, Slough, who had splendid blooms of The Miser, Almira, George Cruikshank, The Dey, Adela, Romulus, E. M. Wynne, and Countess of Jersey; Mr. R. Sydenham was 2nd, with some very fine blooms also. Mr. T. E. Henwood took the 1st prize with six fancies or Y.G.; Mr. T. Anstiss, Brill, was 2nd.

The selfs made a brilliant display, Mr. C. Turner being again 1st with Salamander, Louis Napoleon, King of Scarlets, Cedric, Fiery Cross, Hayes' Scarlet, &c.—a rare collection of show flowers; Messrs. Thomson & Co. were 2nd.

With six selfs, Mr. J. Walker, Thame, was 1st, and Mr. W. Kenyon, Bury, 2nd.

A class was provided requiring six Carnations and Picotees from maiden growers. Mr. J. W. Bentley, Stakehill, Castleton, took the 1st prize.

There were classes for twelve blooms, each arranged with its own foliage, the 1st prizes going to Mr. A. W. Jones, for large mop-like flowers; Messrs. Thomson & Co., who had smooth blooms of fine quality, having to be content with the 2nd place. In the class for six blooms, Mr. A. Spurling, Blackheath, was 1st, and Mr. C. F. Thurstan, Wolverhampton, 2nd.

Of single blooms there were a great number, each division being well represented, and as there were fifteen classes, the work of judging occupied some time. Germania was still the best self, and Mr. R. Sydenham the best yellow ground.

The premier bizarre Carnation was Lord Salisbury (Thomson & Co.); the best flake P.F. Mr. Douglas (Simonite); H.E.P. Red Brunette (Jones); L.E.P. Red, Mrs. Gorton; Self, Germania (Jones); Yellow Ground, Mrs. R. Sydenham (Spencer); Fancy, The Dey (C. Turner).

Bunches of Carnations and Picotees were largely represented, Messrs. Thomson & Co. taking the 1st prize with twelve bunches; Messrs. Hewett & Co. being 2nd. The class for six bunches brought a brisk competition also. Six bunches of border varieties brought a rare display, Messrs. Thomson & Co. taking the 1st prize, and Mr. S. Rogers the 2nd.

Plants in pots, well shown by Mr. R. Sydenham, shower bouquets, sprays and button-holes of Carnations, floral arrangements of various kinds in other flowers, &c., all added to the interest of the exhibition, and several special prizes were offered for Carnations, the competition being good in all.

Miscellaneous collections of various kinds greatly added to the display.

SAFFRON WALDEN HORTICULTURAL.

August 6.—The annual summer exhibition of this Society took place in the grounds of Elm Grove and Fairy Croft, two adjoining residences, with appropriate grounds, near the railway station, four good-sized tents being required to accommodate the exhibits. One of the principal exhibitors was Mr. Archer, gr. to Miss Gibson, Saffron Walden, who had fine specimen stove and greenhouse plants, large specimen Fuchsias, a group of plants, cut flowers, &c., which greatly helped the display. Among flowering plants, tuberous-rooted Begonias, Zonal Pelargoniums, and Ivy-leaved ditto; and among foliage plants a fine collection of six from Mr. Archer, Ferns, Coleus, &c.

Cut flowers were numerous and good, one exhibitor setting up a superb collection of twenty-four bunches. Zonal Pelargoniums in bunches were particularly good, and so were the African Marigolds; bunches of annuals were charming, and Mr. Archer's twelve bunches of stove and greenhouse plants very good.

Fruit was somewhat sparingly represented; Grapes, culinary Apples, and bush fruits were the most numerous kinds.

Vegetables were very good, and the baskets of not less than twelve sorts, and baskets of salads, very attractive.

Among miscellaneous exhibits, Messrs. Paul & Son, the Old Nurseries, Cheshunt, had a fine collection of cut Roses and hardy flowers in great variety; Messrs. Webb & Brand, nurserymen, Saffron Walden, cut flowers of various kinds, including some of the fine old named Hollyhocks of years past, which we had feared were quite lost, and some highly promising seedlings; Mr. J. R. Pitch, nurseryman, Saffron Walden, collections of Sweet Peas, Carnations, &c.; and Mr. C. G. Paine, "Rose and Crown," Saffron Walden, a superb bank of Begonias. The show appeared to be highly successful in every way.

THE CARNATION AND PICOTEE UNION.

July 31.—In favourable weather, the annual exhibition of the Carnation and Picotee Union took place, as usual, in the gardens of the Lodge, Stanley Road, Oxford. The exhibition was a remarkably good one, the quality of the flowers being higher than at the Drill Hall, and there was a remarkably good competition in all the classes. A tent, open at the sides, contained the competitive exhibits, and the numerous visitors were enabled to inspect them under pleasant conditions.

There were seven stands of twelve dissimilar blooms of Carnations, Mr. R. Sydenham, Birmingham, taking the 1st prize with some excellent blooms of C.B. J. D. Hextall, P.P.B. Sarah Payne, P.P.B. Charles Phillips, S.B. Robert Lord, P.F. Gordon Lewis, C.B. Master Fred, R.F. Thalia, P.F. Agricola, C.B. Lord Salisbury, S.F. Sportsman, S.B. Dr. Hogg, and S.F. Clipper; Messrs. Thomson & Son, nurserymen, Birmingham, were 2nd, having some very good blooms also, the leading flowers being S.F. Guardsman, R.F. Tom Woods, C.B. J. D. Hextall, C.B. James Merryweather, P.F. Mayor of Nottingham, and S.B. Robert Houlgrave; 3rd, Mr. C. Phillips, Reading.

There were eight exhibitors of six blooms of Carnations, Mr. F. Hooper, nurseryman, Bath, taking the 1st prize with S.B. Edward Adams, P.F. James Douglas, C.B. Seedling, P.P.B. William Skirving, P.F. Charles Henwood, and C.B. Mrs. Barlow; 2nd, Mr. Joseph Brockhurst, Moston, Manchester, who had in fine condition S.B. Edward Adams, C.B. Master Fred, S.F. Waterloo, R.F. Thalia, C.B. Thaddeus, and S.B. Robert Houlgrave; 3rd, Mr. J. Edwards, Manchester.

The class for twelve dissimilar Picotees brought eight stands, and Mr. R. Sydenham was again 1st. He had H. Red E. Mrs. Lovett, H. Ro. E. Norman Carr, L.P.E. Mrs. Kingston, H. Red E. Brunette, L. Ro. E. Rosie Sydenham, H. Ro. E. Little Phil, L.P.E. Diana, and H. Ro. E. Heroine, H.P.E. Amy Robsart, H.P.E. Miriam, L. Ro. E. Favourite, and H.P.E. William Openshaw; 2nd, Mr. A. W. Jones, Birmingham, also with a good stand of blooms, the varieties mainly as the foregoing; 3rd, Messrs. Thomson & Son, Birmingham. There were eleven stands of six Picotees, Mr. F. Hooper again taking 1st prize with H. Red E. J. B. Bryant, L. Red E. Mrs. Bower, L. Ro. E. Edith D'Ombrain, L. Ro. E. Nellie, H.P.E. Amy Robsart, and H. Red E. Brunette; Mr. W Spencer, jr., Hendon, was a very close 2nd with H. Rose E. Mrs. Sharpe, H. Ro. E. Little Phil, H. Ro. E. Harlequin, H. Red E. Brunette, H.P.E. Muriel, H. Ro. E. Mrs. Burnett, &c.; 3rd, Mr. H. Haslett, Oxford.

Single blooms were produced in large numbers, the best scarlet Bizarres were George, C. H. Herbert, and Robert Houlgrave; the best crimson bizarres, Richard Beilby, Homer, and John Harband; the best pink bizarres, J. D. Hextall, Rifleman, and Sarah Payne; the best purple flakes, James Douglas, and Mayor of Nottingham; the best scarlet flake, Sportsman; the best rose flakes, Thalia, Dodwell's 1341, and Tom Wood. The best selfs, Germania and Ruby; the best fancies, Tournament, Mr. Robert Sydenham, and Fred Hooper; and the best yellow grounds, Thomas Anstiss and Terra Cotta.

Of Picotees, the best heavy edges were Rose E., Mrs. Burnett, Red Edge, Brunette, Rose Edge, and Little Phil; the best medium edges, Rose, Little Phil, Rose, Rosie Sydenham, and P. E. Amelia; the best light edges, Rose Nellie and Rose Favourite; the awards in each case being made in the order in which the names are given.

The premier Carnation was J. D. Hextall, C. B. from Mr. R. Sydenham, who had the premier self in Ruby; the premier Carnation was Cardinal Wolsey, from Mr. J. Douglas; the premier Picotee, Mrs. Payne, rose edge, from Mr. C. Phillips; the premier yellow ground, Mrs. R. Sydenham, from Mr. W. Spencer, Jr.

Stands of twelve selfs, fancies, or yellow grounds were numerous, and the blooms very bright and effective. There were ten exhibitors of twelve blooms, Mr. R. Sydenham being 1st with Dodwell's 919 Y.G., self Ruby, self Mrs. Ford, Y.G. Queen of Buffs, self rose sport from Thalia, fancy Duchess of Portland, Uncle Tom, dark self Fanny Vandyck, Y.G. Star of Bath, scarlet self sport from H.

Cannell, Y.G. Dodwell's 957, and pink self Midas. 2nd, Mr. W. Read, The Cottage, Stanley Road, Oxford, who had Uncle Tom, Germania, and seedling selfs and fancies. 3rd, Messrs. Thomson & Son.

There were ten stands of six blooms, yellow grounds preponderating, and Mr. A. W. Jones was 1st, with very good blooms indeed of Mrs. R. Sydenham, Victory, Stadtrath Bail, Germania, Dodwell's 1143, and Dodwell's 969. 2nd, Mr. W. Spencer, jun., with Mrs. R. Sydenham, Romulus, Victory, Janira, Madame Van Houtte, and Schlieben. 3rd, Mr. J. W. Foulkes, Chester.

With six yellow grounds out of eleven stands, Mr. C. Harden, Ash, Dover, was 1st, having very fine blooms of Nellie Bath, Annie Douglas, Stadtrath Bail, Countess of Jersey, Romulus, and Dodwell's 961. 2nd, Mr. T. E. Henwood, Reading, with Agnes Chambers, Eurydice, Mrs. R. Sydenham, Lily Henwood, and seedlings. 3rd, Mr. J. Douglas, Bookham.

Certificates of Merit were awarded to Mr. J. Douglas for the following new yellow-grounds:—Mrs. Douglas, Ladas, and Mrs. Drawfield; and to the following border varieties:—Mrs. Audrey Campbell, a soft yellow self; Cardinal Wolsey, a pale ground flower, deeply edged with bright salmon-red; Duke of Orleans, a pale, soft yellow self; and Hayes, scarlet self.

BEDDINGTON, CARSHALTON, AND WALLINGTON HORTICULTURAL.

The fifth annual exhibition took place on Bank Holiday in the fine grounds surrounding Carshalton Park, and may be recorded as a great success.

Group of plants arranged for effect in a space not exceeding 80 square feet: in this class the 1st prize was well won by Mr. G. W. Cummins, gr. to A. H. Smee, Esq., the active president of the society, for a beautiful arrangement in which plants of Cattleya aurea were made much use of; 2nd, Mr. J. H. Stevens, gr. to E. G. Coles, Esq, whose Crotons were well coloured.

The best four flowering plants, distinct: 1st, Mr. J. Slater, gr. to Mrs. Hulse, with creditable examples; 2nd, Mr. J. Wright, gr. to Mrs. Bridges. Six Gloxinias in flower: 1st, Mr. J. H. Stevens; 2nd, Mr. T. A. Glover. Three specimen Coleus, good coloured examples, from Messrs. A. Etheridge and J. Wright, gained the awards in the order named.

Three Fuchsias: 1st, Mr. A. Etheridge; 2nd, Mr. J. Wright; nicely flowered examples. Six Exotic Ferns: fine specimens gained Mr. J. H. Stevens the premier award; 2nd, Mr. J. Slater. Tuberous Begonias presented a bright patch of colour, the 1st and 2nd prizes going to Messrs. J. Slater and E. Etheridge.

Cut Roses taking 1st honours were well shown by Mr. G. W. Cummins; 2nd, Mr. J. H. Stevens. In the class for hardy herbaceous flowers, the prizes for well selected and bright collections went to Messrs. J. Slater and G. W. Cummins.

Fruit.—The last-named exhibitor took the leading prizes for single dishes of Nectarines (Dryden) and Peaches (Stirling Castle). In the class for three bunches of Grapes the awards went, for fine fruit, to Messrs. H. Shorbridge and J. Slater. Green-fleshed Melon, for flavour: 1st, Mr. D. Harris; 2nd, Mr. J. Davis. Brace of Cucumbers, nice even examples, gained the prizes to Messrs. J. H. Stevens and A. G. Price.

A very keen competition resulted in the class for a collection of vegetables, nine distinct kinds, open to gardeners and cottagers in the district: 1st, Mr. J. H. Stevens; 2nd, a very creditable exhibit for a cottager, Mr. A. McCrae.

Non-competitive exhibits made an attractive display. We may mention a beautiful lot of hardy flowers, &c., from Mr. John R. Box, Croydon; Messrs. J. Peed & Sons, a nice group of hardy herbaceous flowers; Messrs. J. Laing & Son, a good miscellaneous selection of flowering and foliage plants; the Surrey Seed and Fruit Orchards Company; table decorations from Miss Cooper; and flowers of hardy herbaceous perennials from Messrs. J. Cheal & Sons, Crawley.

A remarkable display of flowers, fruit, and vegetables was made by the cottagers of the district, and in the afternoon the Right Hon. Jesse Collings, M.P., gave an interesting and instructive address on garden allotments, &c., to a crowded audience. Mr. John Wright also gave an address, with object lessons, showing the effects of right and wrong methods in the production of vegetables and fruit, which was listened to with great attention.

In the Conference tent was an excellent display of vegetables from the Continuation School Gardens, under the auspices of the Surrey County Council Technical Education Committee. This attempt—and a very successful attempt it was—is noteworthy by reason of its being the first that has been made in this country. We look to great things in this direction in the future; now that such a good start has been made the idea is capable of much expansion and an infinity of good resulting to the participators in it. It was very interesting to observe the different effects of soil on the same vegetable, this information being given with each exhibit. A deserved Award of Merit was given in each case.

The show was well managed by Mr. G. W. Cummins, the Hon. Secretary.

NURSERY NOTES.

MR. JOHN R. BOX'S, CROYDON.

Since 1876, when the tuberous-rooted Begonia may be said to have been put into commerce, the proprietor of this nursery has done much to improve this now deservedly popular flower, and a recent visit shows him to be still in the van of progress. In looking over the doubles it was observed that most of the old pendulous varieties have been discarded, those now in favour having almost an erect poised flower, very large and full, and some of them may be grown without any supports being needed, being stocky and short-jointed, invaluable therefore for the greenhouse and conservatory. A few varieties (amongst the many observed) may be noted. Beauty of Belgrove: in colour and form of flower this resembles the well-known La France Rose, beautiful silvery pink, flowers large and very fine. Mrs. Cannell is a great beauty, creamy-white, perfect in shape. Primrose Queen, light yellow, most beautifully shaped of its colour. Henshaw Russell, glowing scarlet flowers of fine form and great substance, good habit. A good acquisition is J. E. Midson, fine scarlet, free flowering. A new variety not yet introduced to commerce has just been named Prince Edward, a plant of very good habit, bearing bright scarlet rosette-shaped flowers. A superb variety is Mrs. Castle, of a beautiful salmon shade, quite distinct. Octavie is a very pretty white Camellia-like flower, remarkably free-flowering, dwarf, and for cut blooms it is invaluable. Rev. E. Lascelles is a very fine deep yellow, flowers well formed and free; splendid habit; one of the best. Mrs. Stephenson is a soft rose, delicate shade, large flowers. Hollyhock, pink, medium-sized flowers, quite upright, a favourite. Triomphe de Nancy, delicate pale yellow, broad petals, like a Tea Rose; a grand variety. Hon. Mrs. Bertie, creamy white, beautiful shape, perfectly upright; a great beauty. Another good creamy white is Mrs. French, very large imbricated flowers, vigorous habit; a fine variety. Madame Pfitzer is a rich yellow, flowers medium sized. A good collection of singles was also observed in superb colours as dark crimson, crimson, brick-red, scarlet or vermilion, blush pink, rosy pink, rose, deep rose, pure white, primrose yellow, rich yellow, golden yellow or bronze, orange scarlet, copper or apricot, and salmon or flesh.

In a week or two hence the bedded-out Begonias will be a grand sight at this Nursery, judging from present appearances. Some 100,000 are used for this purpose, and in all the popular colours, the aim which has been attained being to get dwarf stocky plants producing upright flowers on short stalks, so as to ensure the most effective results. Mr. Box is marching with the times in having a good and comprehensive collection of hardy herbaceous plants, containing all the most desirable plants amongst this popular class. *J. B.*

Obituary.

George Medland.—This patriarchal florist and hybridiser passed away at noon on Friday, August 3, 1894, in his eighty-seventh year, from sudden stoppage of the heart. Seventy-two years ago George Medland commenced a seven years' apprenticeship with the late Mr. Chas. Sclater, at the old Summerlands Nursery, Exeter, and remained in his service for over twenty years. In one of his many notes to me on gardening he refers to that far-off period, speaking of Sclater's Gardens on Southernhay, and that they grew fruit, flowers, and vegetables for market; and also of other gardens in Holloway Street, where they had a fine stretch of brick walls, on which Apricots, Nectarines, and Peaches were in full vigour, producing splendid fruit, and even at that time fetching good prices (3*d*., 4*d*., and 6*d*.). Salading was also a paying crop. One of his favourite flowers—the Carnation—was cultivated extensively, for he remarks that every year several hundreds in pots were grown for blooming, and there was a canvas screen for sheltering them when needed; also all the leading kinds of named Auriculas, Polyanthuses, and Pinks. North-country Pinks were small and thin, but beautifully laced, and were inferior to the larger and fuller flowers of the southern growers. Barrett's Conqueror, Davey's Britannia, Lady Albemarle, and Davey's Earl of Uxbridge were great favourites. Davey of Chelsea was a florist of some note. At that time Mr. Sclater visited London, and made a selection of Pelargoniums, which were then quite unknown in the Exeter district, as only some Cape scarlets and zonals, with a few tuberous-rooted kinds, were grown. These new Pelargoniums created a great sensation in Devonshire, and many of them were Davey's seedlings. Thomson, of Mile End, about the year 1828 was selling off his fine collection of Camellias, and Mr. Sclater bought many of them, including fine specimens of Double White and Chandleri. How to get them to Exeter was a difficulty, the only conveyances being waggons and stage coaches, so he went to Topping's Wharf, and arranged with the captain of an Exeter trading ship. Fortunately the wind was fair and the passage quick, and so all arrived safe and sound. With regard to gardening at Exeter, Mr. Medland states that there were amateur growers of Tulips, Auriculas, Carnations, Polyanthuses, double Primroses, Turban and Persian Ranunculus, and Hyacinths, and that in the upper part of the city lived numerous serge weavers, most of them having nicely kept gardens behind their houses. These old weavers, it seems, were regular devotees, for they had a real love for their pets. Messrs. Ford & Please had a large nursery in Okehampton Street, afterwards known as Dymond's Nursery. Mr. William Ford also had a large nursery in Longbrook Street, another at Lion's Holt, and one near the Cavalry Barracks. Lucombe, Pince & Co.'s nursery was the oldest, dating from 1720, and so long ago as 1840 that great gardener, the late Mr. Pince, had a rich and varied collection of stove and greenhouse plants and Orchids, including many splendid specimens. The other nurseries are of recent date, except Messrs. Veitch & Sons at the Mount Radford Nursery, but now of the Royal Exotic Nursery, Chelsea. When the Mount Radford Nursery closed, the present nursery in the New North Road was opened by the late Mr. Robert Veitch, and is now known as Veitch's Royal Exotic Nursery, Exeter. But of private gardens there were only a few cultivators of hothouse plants, such as Charles Booth, gardener to the late Mrs. Johnes, of Hills Court, and afterwards gardener at Downes, Crediton, who had a good knowledge of plant-growing. Mr. Johnes had a fine lot of stove and greenhouse plants, as well as ornamental trees and shrubs. The late Mr. John Milford of Coaver House, a famous banker of Exeter, was also a great enthusiast and pioneer of horticulture in those parts, and his gardener, Mr. Camble, used to do Grapes, Pine-apples, and stove plants well. It was in this garden that Mr. Medland first saw Azalea indica alba. An old lady named Miss Weston had nice gardens on Southernhay also, and used to visit her brother in London, and return with new and rare plants, obtained from Loddiges' once famous Nurseries. Dung beds, leaves, and tanner's bark, with the old smoke flues, were in those days the heating mediums, and the first hot-water apparatus known to him in the West of England was by Corbett, gardener at Pencarrow, Cornwall, which was the open trough system, flow and return, and very useful in many ways, and that Mr. John Milford aforesaid had

steam for heating his plant houses at Coaver, but eventually hot water for heating purposes soon became general.

With regard to gardeners of that period, after the Exeter Horticultural Society was formed in 1829 or 1830, Mr. Medland gradually became acquainted with many of them, and on the whole they were a respectable and intelligent lot of men, for there were few changes, and most of them remained in their situations to the last. He could only remember two who were able to retire on their means. A few of the oldest gardeners were Hall, at Powderham Castle; Lawrie and Cleall, Nutwell Court; Lowe, Bystock, Saunders, Luscombe Castle; Saunders, Kitley House; Craggs junr., Killerton Park; Craggs sen., Weare House; Nicholls, Winslade Park; Griffin and Yole, Cowley House; Kemp, Rockbeare Court; Anderson, Glendinning and Barnes, Bicton Park; and Mason, Escott Park.

Mr. Medland was born on February 18, 1808, and was employed in Sclater's Nursery over twenty years; in Russell's Nursery at Sidmouth two years; in Mr. Radford's Nursery with the late James Veitch six years; in Addiscott's Nursery at Saint Thomas seventeen years; and from 1875 to 1890 with the late Messrs. Lucombe, Pince & Co., of the great Exeter Nursery, when from infirmities of old age he gave up, and became a pensioner of the Gardeners' Royal Benevolent Institution. He was naturally a retiring and modest man, kind-hearted and a firm friend, and knew more trees, shrubs, fruits, and flowers, at sight than any man I have so far met with. His knowledge of herbaceous and border plants in particular was extraordinary. Those who can remember Messrs. Lucombe, Pince & Co.'s floral displays, during Dr. Woodman's proprietorship, at most of the more important flower shows, will recall their skilfully grown prize-winners in stove and greenhouse plants and Orchids, &c., and also their gorgeous trays of Carnations, Dahlias, Delphiniums, Gaillardias, Hollyhocks, Irises, Pansies, Pæonies, Pentstemons, Phloxes, Picotees, Pinks, Pyrethrums, Roses, &c. The whole of the latter section being under Mr. Medland's control and management. Moreover, his annual exhibition of 500 specimen Chrysanthemums at the Exeter Nursery was also noteworthy. *W. N.*

MARKETS.

COVENT GARDEN, August 9.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. ED.]

POTATOS.

Potato market firm. Prices vary from 3*s.* to 6*s.* per cwt. Old Potatos finished.

SEEDS.

LONDON: *August* 8.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that to-day's market was poorly attended, with but little business passing. New Trifolium, both French and English, is now enquired for, at the low rates prevailing. Samples of this season's new English Rape and Rye, offer at moderate figures. There is no notable alteration in Canary-seed; Hempseed dull. Other articles, at this quiet season, attract but little attention.

FRUITS AND VEGETABLES.

BOROUGH AND SPITALFIELDS: *August* 7.—Quotations:—Cabbages, 2*s.* 6*d.* to 4*s.* per tally; Carrots, 1*s.* 6*d.* to 2*s.* 6*d.*; Turnips, 1*s.* 6*d.* to 2*s.*; Parsley, 1*s.* 6*d.* to 2*s.* per dozen bunches; Onions, Egyptian, 3*s.* 6*d.* to 4*s.* 6*d.* per cwt.

STRATFORD: *August* 7.—The supply to this market during the past week has been excellent, and, with a large attendance of buyers, a brisk trade has been done as under:—Cabbages, 1*s.* 6*d.* to 3*s.* per tally; Lettuce, 6*d.* to 10*d.* per score; frame Cucumbers, 1*s.* 6*d.* to 2*s.* 6*d.* per dozen; Green Peas, 5*s.* 6*d.* to 6*s.* per bag; Plums, English, 2*s.* 6*d.* to 3*s.* 6*d.* per half-sieve; do., foreign, 1*s.* 6*d.* to 2*s.* 3*d.* per box; Green Gages, foreign, 1*s.* 3*d.* to 1*s.* 6*d.* per box; red Currants, English, 2*s.* to 2*s.* 6*d.* per half-sieve; black Currants, 3*s.* to 3*s.* 6*d.* do.; Turnips, 2*s.* to 2*s.* 6*d.* per dozen bunches; Carrots, household, 2*s.* to 3*s.* per bag; Mangels, 25*s.* to 30*s.* per ton; Onions, Egyptian, 4*s.* 6*d.* to 5*s.* per bag; Apples, English, 2*s.* 6*d.* to 3*s.* 6*d.* per half-bushel; Watercress, 6*d.* per dozen.

FARRINGDON: *August* 9.—Quotations:—Cabbages, spring-planted, 4*s.* to 5*s.* 6*d.* per tally; autumn do., 2*s.* 6*d.* to 4*s.* do.; Carrots, 2*s.* per dozen bunches; Turnips, 1*s.* 6*d.* to 2*s.* do.; Scarlet Runners, 5*s.* 6*d.* to 6*s.* per bushel; Vegetable Marrows, 3*s.* to 4*s.* per tally; Plums, green, 1*s.* 6*d.* to 1*s.* 9*d.* per half sieve; 3*s.* to 3*s.* 6*d.* per bushel; ripe Plums, 4*s.* per half bushel; Apples, Lord Suffield, 3*s.* to 3*s.* 6*d.* per half-sieve; Gooseberries, 2*s.* 6*d.* to 3*s.* per half sieve; Red Currants, 2*s.* to 3*s.*; Black do., 2*s.* to 3*s.* per half sieve; Cucumbers, 1*s.* 6*d.* per dozen; Tomatos, 6*d.* per lb. English; Melons, 11*s.* per case Grapes, 8*s.* per barrel; Greengages, 3*s.* per half sieve; Pears, 6*s.* per bushel.

POTATOS.

BOROUGH AND SPITALFIELDS: *August* 7.—Quotations ranged between 60*s.* and 80*s.* per ton.

FARRINGDON: *August* 9.—Quotations:—Essex Hebrons, 70*s.* to 80*s.*; Sutton's Abundance, 70*s.* to 80*s.*; Magnums, 60*s.* to 70*s.*; Bedfordshires: White Hebrons, 80*s.* to 90.; Puritans, 80*s.* to 90*s.*; Snowdrops, 80*s.* to 90*s.*; Reading Giants, 70*s.* to 80*s.* per ton.

LONDON AVERAGES: *August* 8.—English Kidneys, 80*s.* to 90*s.*; Hebrons, 70*s.* to 80*s.*; Snowdrops, 70*s.* to 90*s.*; Rounds, 60*s.* to 74*s.* per ton.

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 110*s.* to 138*s.*; do., inferior, 80*s.* to 120*s.*; do., new, 75*s.* to 130*s.*; hay, best, 100*s.* to 130*s.*; do., specially picked, 140*s.*; do, inferior, 60*s.* to 100*s.*; do., new, 70*s.* to 90*s.*; Mixture, 90*s.* to 130*s.*; and Straw, 43*s.* to 63*s.* per load.

CORN.

Averages.—Official statement of the average prices of British Corn, imperial measure (qr.), for the week ending August 4, and for the corresponding period last year:—1894: Wheat, 24*s.* 4*d.*; Barley, 21*s.* 4*d.*; Oats, 18*s.* 8*d.* 1893: Wheat, 20*s.* 2*d.*; Barley, 21*s.* 8*d.*; Oats, 21*s.* 5*d.*

ENQUIRY.

"He that questioneth much shall learn much."—BACON.

BERBERIS MAHONIA.—Is the fruit of the above shrub fit for domestic purposes? A gentleman calling on me lately and seeing the plants much laden with berries, told me he always made them into wine, and after keeping a short time was quite equal to port. *W. Divers.*

THE WEATHER.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

0, Scotland, N. *Principal Wheat-producing Districts*—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S.

Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; *Channel Islands.

THE PAST WEEK.

THE following summary record of the weather throughout the British Islands for the week ending August 4, is furnished from the Meteorological Office:—

"The *weather* during this week was again in an unsettled condition, with frequent rain, and occasional thunderstorms in nearly all parts of the kingdom. The rain experienced at the opening of the period was very heavy at most of the southern and south-western stations, and that of Aug. 2 and 3 was equally so in Scotland and several of the more northern parts of England.

"The *temperature* continued a few degrees above the mean over 'Scotland' and in 'Ireland, N.,' and slightly exceeded it in the 'Midland Counties' and 'England, N.W.;' in most other districts the values just equalled the normal, but in the 'Channel Islands' there was a deficit of 2°. The highest of the maxima, which were recorded during the earlier part of the week, ranged from 83° in 'Ireland, N.' (at Londonderry), to 74° in 'Scotland, E.' and 'Ireland, S.,' and to 66° in the 'Channel Islands.' The lowest of the minima were registered on somewhat irregular dates, and ranged from 43° in 'Scotland, E.,' to 50° in 'England, S.,' and 'England, N.W.,' and to 54° in the 'Channel Islands.'

"The *rainfall* was less than the mean in 'England, N.E. and E.,' as well as in 'Ireland, N.;' while in 'Scotland, N.' the normal was just equalled. In all other districts there was an excess, that in 'Scotland, E.,' 'England, N.W.,' and the 'Channel Islands' being large. The largest amounts measured at any individual stations were 1·53 in. at Eastbourne, which fell between 1 P.M. and 8 P.M. on July 29, and 1·96 in. at Braemar, 2 in. at Glenlee, and 2·22 in. at Bigrigg, Cumberland, which fell during the twenty-four hours ending on the morning of August 3.

"The *bright sunshine* was less than the normal in all districts excepting 'Scotland, N.' and 'Ireland, N.' The percentage of the possible duration ranged from 35 in 'England, E.,' to 25 in the 'Channel Islands' and 'England, E.,' and to 24 in 'Ireland, S.'"

Answers to Correspondents

*** *Owing to the large increase in our circulation, we are reluctantly under the necessity of going to press some hours earlier. Our contributors, who well know what this implies, will kindly aid us by sending their communications as early in the week as possible. Communications should reach us not later than Wednesday.*

*** FRUIT CROPS.—*We greatly regret that we were unable fully to meet the demand for last week's number, in consequence of which, we fear, some of our correspondents must have experienced delay in the receipt of their copies.*

ARTICHOKE: *C. H. J.* We fail to see anything about the head sent that would account for the long time that they take to cook, &c., unless you let them stay on the plants till the stalk gets tough, when, of course, they are scarcely fit to be eaten.

BIGENERIC HYBRIDS: *W. N.* We are not disposed to say there can be no such thing as a bigeneric hybrid, and we are quite unable to furnish any absolute distinction between species and genera. For practical purposes, such distinctions are matters of convenience only, and depend upon the degree and importance of the points of difference. Of course, if you consider the subject from the point of view of pure science it is quite another matter, but there is then less reason for dogmatic assertion than in the other case.

CARNATIONS: *A. J. S.* Send them to some large growers. We cannot undertake to name florists' flowers,—*R B. P.* The plants are infested with eelworms. Dig up and burn, and do not plant Carnations on or near the spot.

CATTLEYAS: *Dinwoodie.* Next week.

CHRYSANTHEMUM: *Cello.* See the article in present issue on Onion fungus.—*X.* The disease is caused by a fungus, Sclerotinia, like that which attacks Onions; see p. 160. Burn all the affected plants at once. It begins as a mould, and when in that state can be checked by Bordeaux Mixture. Now nothing can be done but burn the plants.

CLOVE CARNATION PRODUCING FLAKED BLOOMS ON SAME PLANT AS THE TYPE FORM: *S. H.* It simply shows of what mixed parentage the florists' Carnation is, as indeed we see in the great variety of the markings observed in the flowers of an undoubted variety which have, in a measure, become fixed by age, varying indeed on one plant, and more markedly if the flowers from several plants are compared with one another.

CONIFER SEEDS: *Constant Reader.* Abies, Picea, the rarer Pinus, Thuia, Cupressus, &c., may be sown in the late autumn in pots, boxes, or pans filled with sandy loam and peat, keeping them in a cold pit or frame, covering them with pieces of tile or slate, to exclude the light, and also mice (which are sometimes very troublesome), and to prevent the evaporation of moisture to some extent. The pots, &c., if many in number, may be piled one on top of the other, thus occupying but little space; but it will be necessary to examine them once or twice before the new year, for the purpose of ascertaining which are in need of water, and which seeds have begun to germinate, at once affording light and air to the latter. In February the pans, &c., should be placed where a frequent examination can be conveniently made, and they should be carefully watered whenever the soil approaches dryness. Another mode of proceeding is to keep the cleaned seed of Abies, Picea, and Pinus in a cool dry place over the winter, and to sow in the spring in prepared frames, or beds in the open. In this case it will be an advantage to mix a small quantity of decayed leaf-mould with the surface soil, although that would not be desirable when sowing in pans, &c., the conditions then favouring the production of mouldiness in the leaf soil, which in turn sometimes extends to the seeds. Abies excelsa and Scots Pine seeds are best raised in beds in the open air, sowing the seeds in March. It is necessary to bury the seed at various depths, according to its size, the finest in size being barely covered with the soil, whilst others, like Pinus pinea and P. edulis, should be covered with 1½ inch of soil, besides having the hard shell enclosing the seed weakened by filing it. Whether in beds, frames, or pots, &c., the soil should be made very firm before and after sowing.

CORRECTIONS.—Medea Rose (see p. 62) This was inadvertently described as of American origin, but this, we learn, is an error. It was introduced by Messrs. W. Paul & Son, of Waltham Cross. At p. 107, fig. B, for teleutospores, read Uredospores.

CUCUMBERS: *H. W. R.* The roots are attacked by eelworms. There is no known cure. Turn them out and burn them, and char the soil before using it for any kind of pot plant, or bury it deeply in your kitchen garden.

GRAPES: *An Old Grower.* The berries on the bunch you sent for our inspection are very seriously shanked, and we fear that the Vine has pushed its roots into the cold soil at the bottom of the 3-feet-deep border, or still farther afield. The malady has been aggravated this year, and perhaps in former years, by heavy cropping, and now the willing Vines have given out. The Vines having been planted in 1887, are still young, and worth the trouble of replanting, which ought to be undertaken when the leaves begin to change colour. We should advise the entire lifting of them, carefully preserving them in a moist state meanwhile, and preserving all healthy roots, never minding the mere fibres, these dying anyhow in great numbers every year. Raise the bottom of the border 1½ foot at the back, and at least 1 foot at the front, which will give a 6-inch fall in the 11 feet of width, or a trifle more than 1 in 12—quite enough, if you have a good drain at the bottom of the slope. It may not be necessary to make the entire border anew, but that will depend on the extent of the roots; and perhaps some of the longest of these may be advantageously shortened, so as to admit of a narrow border accommodating them all.

INSECTS: *Lowfold, Lake Road, Ambleside.* The insect attacking the stems of Dendrobium is Xyleborus morigerus, Blandf., described by me in *Insect Life*, vol. v., ii. The insect has been more than once before the Scientific Committee of the Royal Horticultural Society, and I have had it this year from other sources. *W. F. H. B.*

INSECT ON POPLARS: *Poplar.* One of the Hawk Moths. We cannot suggest a remedy beyond hand-picking and encouraging birds. Probably Sphinx populi, but the colour is a little different from ordinary.

INSECT ON DENDROBIUM: *C. W.* The insect feeding on Dendrobium is a kind of locust, an Orthopteron, of the family Locustidæ, allied to Conocephalus, and in all probability introduced with Orchids. The same, or a similar insect, has often been found in Orchid houses.

LARVÆ OF INSECT: *C. Beck.* Fœnus jaculator, a hymenopterous parasite on the larvæ of certain wild bees that form their nests in decaying wood.

NAMES OF FRUIT: *D. Cowan.* Your Peach is no doubt Grosse Mignonne.—*Dartnell & Co.* We cannot name your Apples, quite undeveloped.

NAMES OF PLANTS: *W. H. M.* 1, common Spruce, Picea excelsa; 2, Redwood, Taxodium distichum; 3, Abies numidica.—*A Constant Reader.* 1, Lysimachia vulgaris; 2, Campanula glomerata; 3, Echinops sphærocephalus; 4, Eryngium campestre; 5, Reseda luteola; 6, the cone without foliage is probably that of Cupressus sempervirens. —*No name.* Box packed with Asparagus. 1, Centaurea montana, white variety; 2, Hieracium aurantiacum; 3, Lysimachia vulgaris; 4, Malva moschata, white variety; 5, Alströmeria aurantiaca; 6, Melissa officinalis, var.—*B. & Sons.* Cychorium Intybus, wild Chicory.—*W. S. D.* Argemone mexicana.—*J. D., Elton.* Campanula nobilis. —*S. P. D.* 1, Adiantum; 2, Begonia echinosepala; 4, Centaurea candidissima; 5, Euonymus japonicus variegatus; 6, Campanula pyramidalis; 7, Lamium purpureum, golden-leaved form; 8, Sedum Sieboldi. —*C. H. J.* 1, Echinops sphærocephalus; 2, Stachys lanata; 3, Solidago virga aurea; 4, Justicia carnea; 5, Agrostis vulgaris; 6, Saxifraga sarmentosa.—*J. H., Osterley.* 1, the true Service, Pyrus Sorbus; 2, a variety of the common Elder, not Alder; 3, Pyrus torminalis.—*C. G.* 1, Stachys Betonica; 2, Circeia lutetiana; 3, Symphoricarpus racemosus, Snowberry; 4, Galeopsis Tetrahit; 5, Hordeum murinum.—*H. H.* A hybrid form of Tritonia which we cannot precisely identify.—*A. R.* 1, Bocconia cordata; 2, Galega officinalis alba; 3, Funkia ovata. Thank you for sending good specimens, properly packed.—*Flora.* 1, probably Origanum vulgare, no flower; 2, Eryngium alpinum; 3, Agrimonia Eupatoria; 4, Actæa spicata; 5, Genista tinctoria, double-flowered; 6, Verbascum Lychnitis.—*C. L., Carlisle.* Odontoglossum odoratum (true), and a very light-coloured form of the species, differing from the larger one known in gardens as O. gloriosum.—*J. H. B.* 1, Sedum villosum probably. Is it wild? Send leaves. 2, Valeriana officinalis; 3, Silene, we do not recognise the species; 4, Spiræa Fortunei; 5, Tussilago Farfara, variegated; 6, Echium vulgare.—*Perplexed.* 1, Spiræa ariæfolia; 2, Mahonia nepalensis; 3, Colutea arborescens; 4, Spiræa Lindleyana; 5, Spiræa Douglasi; 6, Spiræa callosia.

NARCISSUS FOR FORCING: *H. W.* Paper White Early, Grand Monarch, Double Roman, Ard Righ Daffodil; Golden Spur, Incomparabilis var. Stella. The Polyanthus varieties Jonquils, viz., single-flowered sweet-scented, Queen Anne and Campernelle.

NEW APPLE: *G. Mayes & Sons.* Send the fruits to a meeting of the Royal Horticultural Society. The next is on Tuesday, August 14. Address care of Mr. Barron, Royal Horticultural Society's Offices, 117, Victoria Street, Westminster, S.W.

ONIONS DISEASED: *E. Riley.* See article on this subject in present issue, p. 160.

ONION GRUB IN GARDEN LAND: HOW TO DESTROY: *Onion.* The first operation in clearing the land consists in taking up with a trowel every portion of the affected bulbs, putting them in a pail, and burning them forthwith. Pulling up in the usual way leaves the base of the bulb and the maggots behind. The pupæ remain in the land over the winter, and the fly comes out to attack the spring-sown Onions. It is advisable, therefore, to grow no Onions for two years. Trench the land three spits deep if it will bear it; this will bury the pupæ, or fly cases, so deep that the insect cannot ascend to the surface. A dressing of gas lime should be turned in with the first spit, and when Onions are grown again on any land in the garden, it should be heavily manured, so as to force the crop along rapidly. Top-dressings of sand or sawdust saturated with petroleum are said to save a crop from attack, if applied when the plants are a few inches high.

SEEDLING CARNATION: *C. W.* Not so fine a flower as many others in commerce. Of course it would do for cutting as you suggest.

SPOT ON GRAPES: *Henwick.* See recent numbers for full information, especially p. 44, July 14, 1894.

TAKING BUDS OF SINGLE-FLOWERED CHRYSANTHEMUMS: *X. Y. Z.* The end of the present month or first week in September is a suitable time for "taking the buds."

TOMATO DISEASED: *Wilkin.* Your Tomatos are affected with the same fungus that attacks the Potato. Spraying with Bordeaux mixture at an early stage will do much to prevent the disease. It is not of much use to do so now.

TOMATO: *W. B.* Scoop out the seeds, wash them in water in a fine hair or wire sieve, rubbing the pulp through the meshes. When sufficiently freed from pulp, spread out on paper, and dry in the shade. If the fruit is partially decayed, the separation is easier performed.

TOMATOS: *J. H. B.* The purple spots on No. 2 are consistent with health; the yellow spots on No. 1 are the result of fungus.

WOOD WOOL: *J. George.* We think there is scarcely any substance which fulfils its purpose as a packing material better than "wood wool." It is elastic, soft, odourless, durable, and cheap.

SPAN-ROOF FORCING HOUSES

Built for brickwork, 3ft. high, of well-seasoned red deal, roof ventilation according to size, all 21oz. glass, suitable for nurserymen, market gardeners, and those who require a cheap, strong house for forcing or growing Cucumbers, Tomatos, Melons, &c. Delivered to any Station in England.

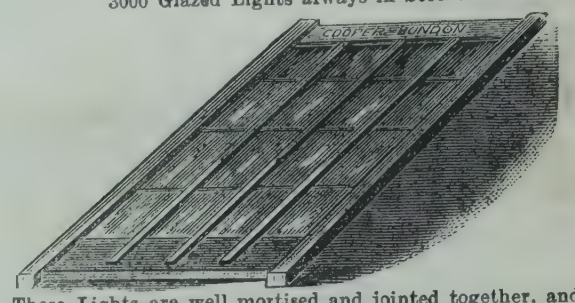
20 × 9, £8.

For Illustrations and Prices of other sizes, see

ILLUSTRATED PRICE LIST FREE.

CUCUMBER FRAMES.

These Frames are 22 in. high at back, 11 in. at front, and are made of 1¼ in. well-seasoned red deal boards. The lights are 2 in. thick, glazed with good 21 oz. glass, nailed and bedded in good oil putty, painted three coats, handles to sashes, and put on rail at the following sizes and prices:—One-light Frames, 4 ft. by 3 ft., 17*s.*; ditto, 6 ft. by 4 ft, £1 8*s.*; Two-light Frames, 6 ft. by 4 ft., £1 10*s.*; ditto, 8 ft. by 6 ft., £2 10*s.*; Three-light Frames, 12 ft. by 6 ft., £3 10*s.* For other sizes and prices see ILLUSTRATED LIST, Post Free.



COOPER'S HYGENIC HEATER.

Burning Parafine or Gas without smoke or smell. These Heaters are constructed as a means of heating by Hot Air without the use of hot water or fires. Its peculiar construction economises the heat generated, so that there is no waste of heat or fuel. There being perfect combustion in this stove, and nothing whatever injurious to plants, but actually everything conducive to their health, it should be observed that plants may be had in full bloom throughout the severest winter. This cannot be obtained in stoves of other systems. The temperature can be regulated to a nicety to suit all requirements, being raised 15 degs. to 40 degs. above that of the outside. From 16*s.* complete. For full particulars, and prices of other sized Heaters, see ILLUSTRATED LIST, post-free on application.

GARDEN LIGHTS.

3000 Glazed Lights always in Stock.

These Lights are well mortised and jointed together, and made in a good workmanlike manner, and are well worthy of inspection. Framework made of 2 in. by 2 in. styles, and properly rabbeted for the glass, with good 2 in. sashbars. The Glazed Lights are nailed and bedded in good oiled putty.

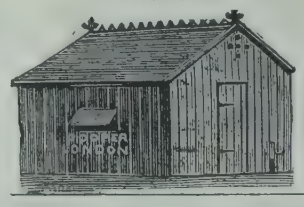
See page 278 in List.

"INVINCIBLE" HOT-WATER APPARATUS.

Most Efficient and Cheapest in Existence.



Made in six sizes: No. 1, to drive 75 ft., £1 15*s*; No. 2, 100 ft., £3; No. 3, 200 ft., £4 10*s.*; No. 4, 275 ft., £7; No. 5, 375 ft., £7 15*s*; No. 6, 500 ft., £9; of 4-in. pipes.

Requires no sunk stokehole, and no brick setting. Will last all night without attention. Will burn house-cinders, therefore costs next to nothing for fuel. Anyone can fix it. A child can stoke it. Success guaranteed.

Cost of complete apparatus for Greenhouse with 4-in. pipes, flow and return along one side, cut and fitted; so that if the internal measurement of the Greenhouse is given, the apparatus will be sent completely ready for fixing, an advantage which will be appreciated by all. Securely and carefully packed on rail at the following respective prices:—7 ft. by 5 ft., £2 15*s.*; 9 ft. by 6 ft., £3; 10 ft. by 7 ft., £3; 12 ft. by 8 ft., £3 5*s.*; 15 ft. by 10 ft., £4 5*s.*; 20 ft. by 10 ft., £5 5*s.*; 25 ft. by 10 ft., £6 5*s.* See page 186 in List.

POULTRY HOUSES.

WANTED, on Long Lease, a PIECE of GROUND suitable for Fruit Growing under Glass, 3 to 4 acres, within easy distance of London. Good loamy soil of good depth, where water can be easily laid on.—Apply to Messrs. SCOTT, SPALDING AND BELL, 15, Queen Street, Cheapside, E.C.

To Fruit and Flower Growers.

FOR SALE, price £10,500, a delightfully situated FREEHOLD PROPERTY, near Reading, comprising 10½ acres of Orchard and Nuttery; large number of new Vineries, Tomato, Cucumber, Mushroom, and other houses; a modern and well-constructed Dwelling-house, 11 rooms, bath-room with hot and cold supply; two Cottages, Stabling, Tennis Lawn, &c. The Orchard and Glasshouses pay well and are easily worked.

Address, B. C., Calcot, Reading.

LONDON, S.E.—A NURSERY for SALE. About 3 Acres: 16 Houses, 2 Lean-to Pits, 2 Span Pits, each about 100 feet long; 2 smaller houses, all well heated, &c.; also Cold Frames, &c., Dwelling-house, Stables, Sheds, &c. About 5 miles from Covent Garden. Open to consider a reasonable offer.

Apply to SHUTTLEWORTH, Limited, Peckham Rye, S.E.

Bocking Nurseries, near Braintree, Essex.
To NURSERYMEN, FLORISTS, and OTHERS.

FOR SALE, in consequence of the death of the Proprietor, the NURSERY, FLORIST, and MARKET-GARDEN BUSINESS, established over 70 years, with Freehold Dwelling House, for heated Glass-houses, several Glass-pits, Potting-shed, &c., and 3 roods and 7 perches of Garden Ground.

Also LEASEHOLD NURSERY, containing 1a. 2r. 35 p.

For further particulars, apply to EDWARD HOLMES, Solicitor, Braintree.

FOR SALE, a Valuable, Long LEASEHOLD NURSERY, 6 miles from Covent Garden. Seven large Greenhouses, well stocked with Vines, Cucumbers, and Plants. Five-roomed Cottage; low ground rent. Lease 87 years to run; 85 feet of Glass facing Main Road.

All particulars of A. B., 11, Dafforne Road, Tooting, Surrey.

FLORIST'S and NURSERYMAN'S BUSINESS for DISPOSAL, situate in a lovely part of Surrey, and almost under the shadows of a Royal residence, consisting of some 16 or 18 acres of rich Land, with a warm aspect, five capital Glass-houses, thoroughly well heated, and will soon require to be increased; several Hot and Cold Frames, splendid Boiler and House, excellent Stabling, large Potting-sheds, Mushroom-house and Pits, good Lofts, and, in fact, everything necessary. Also an excellent Villa Residence of about eight rooms, Bath and every convenience. Only £2000 required for above (part Freehold), including good Horses, Vans, and Plant.—Sole representatives, W. R. HILL AND CO., 5, Adelaide Street, Charing-Cross, W.C.

Guernsey, in the best part of the Island.

TO BE SOLD, a VALUABLE FREEHOLD PROPERTY, consisting of about 40 acres, with good Residence, very extensive Glasshouses for growing Grapes, Melons, and Tomatos, all now in full bearing. Much of the long frontage enjoys fine sea views, and is ripe for building.

Price, 6,000 guineas. Apply to

T. G. WHARTON, Estate Agent, 8, Ironmonger Lane, E.C.

FOR SALE.—NURSERY, 3½ acres; seven miles from Covent Garden; four 100-feet Houses, Pits, Lights, &c., well stocked.—Particulars of—

X. Y., 6, Malta Road, Leyton, Essex.

TO BE SOLD.—BROOK LANE NURSERY, ORMSKIRK, LANCS.—This Old-established Nursery, situate 10 miles from Southport, and 12 miles from Liverpool, consists of 5¼ Acres of Freehold Land, with substantially-built Dwelling-house thereon, containing Kitchen, Scullery, 2 Entertaining-rooms, 4 Bedrooms, Bathroom, &c., and every sanitary convenience; also 3 large Greenhouses, Propagating-pit, a large number of Frames, Stable, Potting-shed, 2 Packing-sheds, &c., &c.

The Stock consists of about 50,000 choice named and Hybrid RHODODENDRONS (including many new varieties not yet sent out), many thousands of AZALEAS, choice Seedling and named varieties; a large stock of HOLLIES of the best kinds, HARDY CONIFERS, 25,000 LILIUM AURATUM; also Greenhouse RHODODENDRONS, sweet-scented and new Hybrid free-blooming kinds, and GENERAL NURSERY STOCK, all in robust health, too numerous to name here.

The Land is very eligible for Building purposes, having 330 yards frontage, with Gas, Water, and Main Sewer passing down the road by which it is for the most part surrounded.

Owing to the very advanced age of the proprietor the whole of the above premises, namely, Land, Dwelling-house, and other Buildings, with Nursery Stock (which may be taken at a valuation if preferred), to be disposed of.

Personal inspection invited, and for full particulars as to price, &c., apply to—

ISAAC DAVIES, Brook Lane Nursery, Ormskirk.

SEED and NURSERY BUSINESS for SALE. —Sound going trade. Good premises and room for a large concern as a branch establishment. Particulars on *bond fide* application, to R. H. POYNTER, Seed Merchant and Nurseryman, &c., Taunton.

TO BE SOLD, the Business of a High-class FRUITERER'S, FLORIST, and NURSERYMAN, situated in the west end of one of the most fashionable Seaside resorts on the South Coast, doing a turnover of nearly £5,000 per annum, and making a handsome profit. The Nursery consists of five houses, well stocked, and all heated, thus affording an opportunity rarely met with of acquiring a well-established and thoroughly genuine concern. Incoming about £1,800. Fullest investigation.—Apply to S. M., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

TO LET.—NURSERY and MARKET GARDEN, 8½ acres, a short distance from a County Town in North Wales. Immediate possession. To a suitable person, if without capital, arrangements can be made with the Owner. —Apply to DAVID ROBERTS AND SON, Corwen.

PROTHEROE AND MORRIS, HORTICULTURAL MARKET GARDEN and ESTATE AUCTIONEERS and VALUERS, 67 and 68, Cheapside, London, E.C., and at Leytonstone, E. Monthly Horticultural Register had on application.

FOR ORCHIDS and GARDENERS to Grow them, apply to SANDER'S, St. Albans. The finest stock of Orchids in the World.—30 minutes from St. Pancras.

CUT FLOWERS.—CUT FLOWERS.

We hold SALES every MONDAY, WEDNESDAY, and FRIDAY EVENING at half-past five o'Clock. These Sales have been continuous, without a week's omission, for over eight years. References to Senders of over eight years' standing.

POPE AND SONS, 6, Phillips Street, Birmingham.

MAIDENHAIR FERNS.—Extra fine plants, in 48's, 5*s.* per doz.; also in 32's, 7*s.* per doz. Packing free. T. BAKER, Manager, Blandford Nurseries, Upper Teddington.

B. S. WILLIAMS AND SON'S IMPROVED MUSHROOM SPAWN, the finest in cultivation for Outdoor and Indoor Culture. Per bushel, 5*s.*; per cake, 6*d.* Per cake, free by Parcel Post, 1*s.*

Victoria and Paradise Nurseries, Upper Holloway, London, N.

FOR SALE, fine SPECIMEN AGAVE AMERICANA. Leaves fully 6 feet in length and striped with yellow. No reasonable offer refused.—For particulars apply to C. BROWN, Gardener, Neasham Hill, Neasham, Darlington, Durham.

MALLER AND SONS beg to offer to the Trade a very extensive and unusually well-grown stock of Ericas (hyemalis and other varieties), Epacris, Solanums, Genistas, Cyclamen, Double White Primulas, Bouvardias of sorts, Adiantum cuneatum and other Ferns; Palms in variety, Gardenias, Stephanotis, Dipladenias, Ficus elastica, Crotons, Genistas, Tea Roses (in pots), Boronias (megastigma and heterophylla), Vines in pots, &c. An inspection is invited.

TRADE CATALOGUE forwarded on application.

The ANNUAL SALE by AUCTION will be held on TUESDAY, September 11.

Burnt Ash Road Nurseries, Lee, S.E.

VIOLA CUTTINGS.—These strike easily now in a shaded cold frame. We offer 100 for 7*s.* 6*d.*, cash; 50 for 4*s.* 3*d.*; 25 for 2*s.* 6*d.* Four cuttings, two cuttings, or one cutting of each of the following 25 grand exhibition sorts: A. Grant, Ardwell Gem, Blue Cloud, Bullion, Countess of Hopetoun, Countess of Kintore, Countess of Wharncliffe, Crimson King, Duchess of Fife, Duchess of Sutherland, Evelyn, Goldfinch, H. W. Stuart, J. B. Riding, Lord Elcho, Lady Dundonald, Mrs. Grant, Mrs. Bellamy, Princess Beatrice, Rob Roy, Sylvia, Wonder, Wm. Neil, White Duchess, and Violetta. 100, in 12 best bedding varieties, 5*s.* 6*d.*; 1000, in 25 varieties, £2. All named, and carriage free.

DOBBIE AND CO., Florists to the Queen, Rothesay.

LATE STRAWBERRIES. Let us sing to the praises of three late Strawberries.

FROGMORE LATE PINE, which is absolutely the flavour of Ripley Queen Pineapple, sturdy in growth, large in size, and an abundant cropper. 7*s.* 6*d.* per 100.

OXONIAN, true, not Eleanor, which it is generally supplied for. It is simply an enormous cropper, rather sharp in taste, and the latest Strawberry on record. 5*s.* per 100.

Now comes lastly, but not leastly, that good old public servant, ELTON LATE PINE, warranted true; no other Strawberry like it for preserving.

All the New Strawberries supplied, all warranted true, and the best plants in the trade.

R. GILBERT, Burghley, Stamford.

SOLANUM CAPSICASTRUM

"CLOTH OF GOLD."

The entire Stock, from a start of one plant, which originated from seed at HARTLAND'S, Ard Cairn, Cork, is offered for Sale to the highest bidder. The leaves are the colour of GOLDEN ELDER, and the berries bright orange-scarlet.

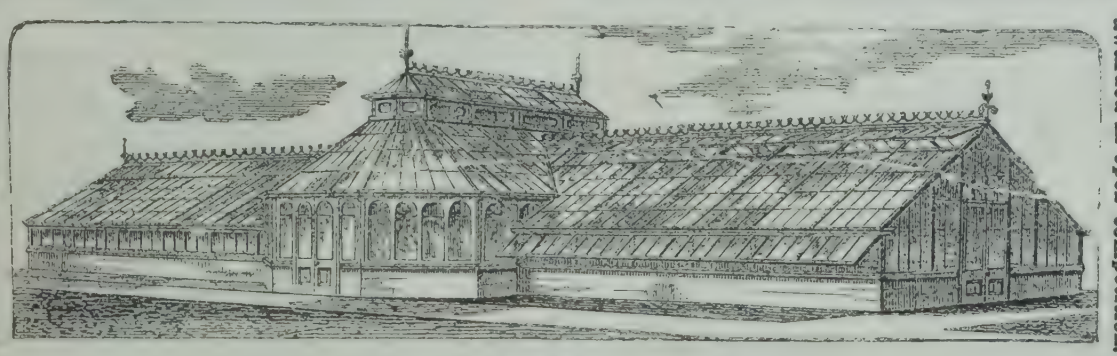
The plant, in habit, GUARANTEED equal to the finest form seen in Covent Garden, but with this difference, that the foliage as stated is golden. It also comes more golden from seed. This I have only tested this season. At night the plants are scarlet and gold.

Apply to—

WM. BAYLOR HARTLAND,
SEEDSMAN, CORK.

NEW CRIMSON PERPETUAL-FLOWERING CARNATION
URIAH PIKE.

This beautiful Carnation, with its powerful clove scent, has been one of the greatest attractions at all the leading Shows, a proof that it is undoubtedly the finest Carnation offered to the Gardening World for many years. Notwithstanding the large quantities sent out, I still have a very large Stock of good strong healthy plants of all sizes to offer.



Plants in 5-inch pots, 5s. each, 50s. per dozen.
Plants in 3½-inch pots, 2s. 6d. each, 24s. per dozen.

TERMS, CASH WITH ORDER. SPECIAL QUOTATIONS TO THE TRADE.

Six First-class Certificates, besides Medals, have been awarded to—

JAMES PIKE, PARK ROAD NURSERIES, SOUTH ACTON, LONDON, W.

Five 1st Prize Medals recently awarded in open competition.

Five 1st Prize Medals recently awarded in open competition.

R. HALLIDAY & CO.,
HOTHOUSE BUILDERS and HOT-WATER ENGINEERS,
ROYAL HORTICULTURAL WORKS, MIDDLETON, MANCHESTER.

Vineries, Stoves, Greenhouses, Peach Houses, Forcing Houses, &c., constructed on our improved plan, are the perfection of growing houses, and for practical utility, economy, and durability cannot be equalled. We only do one class of work, and that THE VERY BEST.

Conservatories and Winter Gardens designed architecturally correct without the assistance of anyone out of our firm, from the smallest to the largest. **Hot-water Heating Apparatus,** with really reliable Boilers, erected, and success guaranteed in all cases. **Melon Frames, Sashes, Hot Bed Boxes, &c.,** always in stock.

Plans, Estimates, and Catalogues Free. Customers waited on in any part of the Kingdom.

Our Maxim is and always has been—

MODERATE CHARGES. FIRST-CLASS WORK. THE BEST MATERIALS.

ALL WHO WORK NEED

in mine or factory, warehouse or field, workroom or foundry,

some refreshing, thirst-allaying, pleasant and invigorating drink. The cheapest, best, and most popular beverage is a glass of

MASON'S NON-INTOXICATING BEER

made from **MASON'S EXTRACT OF HERBS.** Everyone likes it. Try it and save money.

A Nine-gallon Cask of Alcoholic Beer from a Brewery will cost you 10s. 6d., but Eight Gallons of Beer made from Mason's Extract of Herbs can be obtained for 6d., plus a pound or two of Sugar and a little Yeast.

IMITATED BUT NOT EQUALLED.

Of all Chemists and Stores, or a sample bottle sent free for 9 stamps. With every sample bottle we send free a beautifully coloured little story book entitled "How a Railway Accident was averted." Write for a sample to-day.

Inventors and Manufacturers: NEWBALL & MASON, NOTTINGHAM.

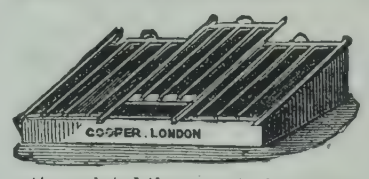
SPAN-ROOF FORCING HOUSES



Built for brickwork, 3ft. high, of well-seasoned red deal, roof ventilation according to size, all 21oz. glass, suitable for nurserymen, market gardeners, and those who require a cheap, strong house for forcing or growing Cucumbers, Tomatos, Melons, &c. Delivered to any Station in England.

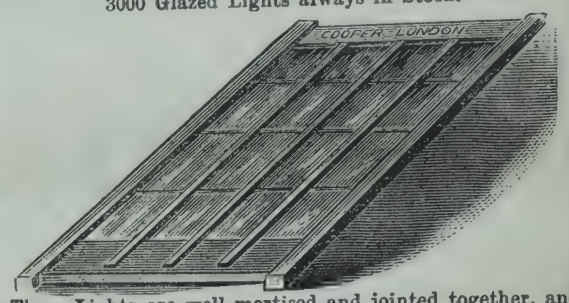
20 × 9, £8.

For Illustrations and Prices of other sizes, see

ILLUSTRATED PRICE LIST FREE.

CUCUMBER FRAMES.

These Frames are 22 in. high at back, 11 in. at front, and are made of 1¼ in. well-seasoned red deal boards. The lights are 2 in. thick, glazed with good 21 oz. glass, nailed and bedded in good oil putty, painted three coats, handles to sashes, and put on rail at the following sizes and prices:—One-light Frames, 4 ft. by 3 ft., 17*s.*; ditto, 6 ft. by 4 ft., £1 8*s.*; Two-light Frames, 6 ft. by 4 ft., £1 10*s.*; ditto, 8 ft. by 6 ft., £2 10*s.*; Three-light Frames, 12 ft. by 6 ft, £3 10*s.* For other sizes and prices see ILLUSTRATED LIST, Post Free.



COOPER'S HYGIENIC HEATER.

Burning Parafine or Gas without smoke or smell. These Heaters are constructed as a means of heating by Hot Air without the use of hot water or fires. Its peculiar construction economises the heat generated, so that there is no waste of heat or fuel. There being perfect combustion in this stove, and nothing whatever injurious to plants, but actually everything conducive to their health, it should be observed that plants may be had in full bloom throughout the severest winter. This cannot be obtained in stoves of other systems. The temperature can be regulated to a nicety to suit all requirements, being raised 15 degs. to 40 degs. above that of the outside. From 16*s.* complete. For full particulars, and prices of other sized Heaters, see ILLUSTRATED LIST, post-free on application.

GARDEN LIGHTS.

3000 Glazed Lights always in Stock.

These Lights are well mortised and jointed together, and made in a good workmanlike manner, and are well worthy of inspection. Framework made of 2 in. by 2 in. styles, and properly rabbeted for the glass, with good 2 in. sashbars. The Glazed Lights are nailed and bedded in good oiled putty.

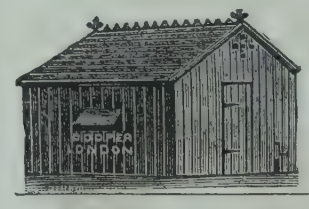
"INVINCIBLE" HOT-WATER APPARATUS.

Most Efficient and Cheapest in Existence.



Made in six sizes: No. 1, to drive 75 ft., £1 15*s*; No. 2, 100 ft., £3; No. 3, 200 ft., £4 10*s.*; No. 4, 275 ft., £7; No. 5, 375 ft., £7 15*s*; No. 6, 500 ft., £9; of 4-in. pipes.

Requires no sunk stokehole, and no brick setting. Will last all night without attention. Will burn house-cinders, therefore costs next to nothing for fuel. Anyone can fix it. A child can stoke it. Success guaranteed.

Cost of complete apparatus for Greenhouse with 4-in. pipes, flow and return along one side, cut and fitted; so that if the internal measurement of the Greenhouse is given, the apparatus will be sent completely ready for fixing, an advantage which will be appreciated by all. Securely and carefully packed on rail at the following respective prices:—7 ft. by 5 ft., £2 15*s.*; 9 ft. by 6 ft., £3; 10 ft. by 7 ft., £3; 12 ft. by 8 ft., £3 5*s.*; 15 ft. by 10 ft., £4 5*s.*; 20 ft. by 10 ft., £5 5*s.*; 25 ft. by 10 ft., £6 5*s.* See page 186 in List.

This House is suitable for SHOOTING BOXES, GAMEKEEPER'S HUT, CRICKET or GOLF GROUNDS, BOTTING-HOUSE, TOOL-HOUSE, COAL-HOUSE, OUT-HOUSE, BICYCLE-HOUSE, and CHILDREN'S PLAY-HOUSE, &c.

CASH PRICE, CARRIAGE PAID.

12 ft. long, 8 ft. wide, 6 ft. 6 in. high at eaves, 9 ft. high to ridge, £10 10s.

If lined with matchboarding inside, £3 10s. extra.

Wood floor, if required, £1 2s. extra.

A CHEAPER PATTERN with one window and one door, £8 10s., lining and floor extra.

Send for ILLUSTRATED CATALOGUE free.

BOULTON & PAUL, NORWICH.

THE IMPROVED GARDEN GULLY

(VINCE'S PATENT).

This useful invention is a great improvement on the ordinary Garden Grating, and is especially suitable for hilly walks and drives. As they never get stopped by rubbish or sand they effectually prevent the washing away of the gravel in heavy storms, and they save half the labour in cleaning out the cesspools. The prices are:—

8-in., 2s.; 10-in., 3s.; 12-in., 6s. 6d.

(*The larger sizes are very strong for Carriage Drives.*)

Full Particulars and Testimonials on application.

CHRYSANTHEMUMS.

All Gardeners who hope to have really fine blooms this autumn will now be beginning to feed their plants. The best of all Manures for this purpose is "PEARSON'S CHEMICAL," as it is a perfect plant food, has no offensive odour, and is always perfectly identical in composition, so that its use once learned there is no further risk or trouble in applying. Some of the finest exhibition blooms shown in the Midlands have been grown by its aid alone, without any other fertiliser. In wet weather a teaspoonful to each plant may be sprinkled on the surface of the soil, but we ourselves prefer to use it as a liquid, our method being to dissolve a 6-inch potful in a 36-gal. tub, this being afterwards used at the rate of 2 gals. in each water-barrow (25 gals.). Gardeners are cordially invited to call and see our plants, and judge of the effect for themselves. Price and all information free on application.

J. R. PEARSON & SONS,
CHILWELL, NOTTS.

DICKSONS' NEW CARNATIONS, 1894.

A series of 6 splendid varieties of BORDER CARNATIONS, distributed for the first time this season.

1. **LORD ROSEBERY.**—Primrose-yellow; bright and effective; very free.
2. **COUNTESS GROSVENOR.**—Deep rosy-pink; compact fine flower.
3. **LADY MARGARET.**—Blush; delicate distinctive tint; very free flowering.
4. **MRS. ROBERT YERBURGH.**—Pale pink; a beautiful flower, compact, and of good habit.
5. **DEAN OF ROCHESTER.**—A showy, brilliant flower; apricot ground, suffused with rich rose-scarlet.
6. **MRS. LEO GRINDON.**—Bright rose-pink; compact habit; neat flower of striking delicacy and beauty.

Price 2s. 6d. each, or 12s. 6d. the set of Six.

DICKSONS NURSERIES, CHESTER.

STRAWBERRIES

LAXTON'S "ROYAL SOVEREIGN."

An earlier higher quality and Improved Sir J. Paxton
Three Medals and Five First-class Certificates awarded.

All must have the finest early Strawberry yet introduced. Fruit of the largest size, brighest glossy scarlet colour, flavour rich (quite equal to British Queen), ripens with Noble; a splendid cropper and grower, and we consider it to be the long-sought EARLY HIGH-FLAVOURED AND IMPROVED SIR J. PAXTON, a splendid forcer, and in every way worthy of its name. Handsome coloured plate, now ready, 6d. (gratis to customers).
12s. per doz., £3 per 100; in pots, 18s. per doz., £4 per 100.

LAXTON'S SENSATION.

First-class Certificate Gardening and Forestry Exhibition, May 10, 1893.

An enormous second early variety of good flavour, and probably the largest Strawberry ever introduced. A remarkably strong grower, and producing fruit in wonderful clusters. Will prove a welcome addition to the list of good sorts. Forces splendidly.
20s. per 100, 4s. per doz.; in pots, 30s. per 100, 6s. per doz.

LAXTON'S SCARLET QUEEN.

(First-class Certificate.)

The best first early—very early. Fine colour and shape, and the richest flavour. Habit strong, a very prolific variety, a splendid early table and market fruit.
10s per 100, 3s. per doz.; in pots, 18s. per 100, 4s per doz.

LAXTON'S LATEST OF ALL.

The best late Strawberry, and the largest and best late variety. A seedling from British Queen, but much later. Flavour grand.
8s. per 100, 2s. per doz.; in pots, 16s. per 100, 3s. per doz.

The following best varieties for forcing or early planting can be supplied STRONG in pots at once:—

	Per 100.		Per 100.
A. F. Barron	15s.	King of Earlies	15s.
Nicaise	15s.	Grosse Sucrée	16s.
British Queen	15s.	Latest of All	16s.
Dr. Hogg	16s.	Noble	16s.
Jas. Veitch	15s.	President...	15s.
Ruskin	16s.	Napier	15s.
Commander	16s.	Paxton	15s.
Competitor	16s.	Viscountess	15s.
Keen's Seedling	15s.	Waterloo...	16s.

Also, strong Open Ground Runners can now be supplied at usual prices, of—
Nicaise, Sucrée, Vicomtesse, British Queen, Paxton, President, Albert, Captain, King of Earlies, Marguerite, Dr. Morère, Dr. Hogg, Stirling Castle, Sharpless, A. F. Barron, Waterloo, Countess, Jas. Veitch, Unser Fritz, Elton Pine, Lucas, Filbert Pine, and all other best sorts, English and Foreign (about 200 varieties in stock). Full LIST on application to—

LAXTON BROTHERS, BEDFORD.

FERNS. — GREAT ANNUAL SALE. — SURPLUS STOCK (TRADE):—Ferns, in 2½-inch pots, Stove and Greenhouse, 30 best selling sorts, 10s. per 100; 200 out of pots, 16s.; large ditto, in 48's, 10 best selling sorts, 6s. per dozen, Adiantum cuneatum, in 48's, for cutting (value in fronde), 6s. and 8s. per dozen; ditto, for making large plants quickly (bushy), 16s. and 20s. per 100. Aralias, Grevilleas, Rhodanthe, Cyperus, in 48's, 6s. per dozen. Ficus, Palms, Dracænas, 1s. each. Pelargoniums and Hydrangeas, 9d. each. Packed free. Cash with Order. List free.—J. SMITH, London Fern Nurseries, Loughborough Junction, London, S.W.

Bougainvillea glabra var. Sanderiana.

HUGH LOW AND CO. offer fine Plants of this free-flowering and brilliantly-coloured variety of the old Bougainvillea glabra, as exhibited by them, and Certificated by the Royal Botanic Society, Regent's Park, May 30, 1894. Price, 5s. each.
HUGH LOW AND CO., Clapton Nursery, N.E.

LILIUM LOWII. (First-class Certificate Royal Hort. Soc., July 11, 1893.)—Several plants of this rare and beautiful Lily are now flowering at the Clapton Nursery.
HUGH LOW AND CO., Clapton Nursery, N.E.

CROTON RUSSELLII. (First-class Certificate, Royal Hort. Soc., November 14, 1893.) Most distinct novelty, excelling any other variety in brilliancy of colour. Price, 21s. each.
HUGH LOW AND CO., Clapton Nursery, N.E.

DICHORIZANDRA MUSAICA GIGANTEA (First-class Certificate at Temple Show, 1894).—A very handsome improvement on the type. Price, 21s. each.
HUGH LOW AND CO., Clapton Nursery, N.E.

NEW, SINGLE, SCARLET CLEMATIS, Madame Edouard André. Fine plants, 3s. 6d. each.
HUGH LOW AND CO., Clapton Nursery, N.E.

CARNATIONS.

JAMES DOUGLAS, F.R.H.S., begs to announce that his Catalogue for Autumn, 1894, and Spring, 1895, is Now Ready, and will be sent post-free to all intending purchasers. It contains full Descriptive Lists of the New Malmaison Carnations, and the New Border Carnations produced by Martin R. Smith, Esq., in his garden at Hayes. There is also a full Descriptive List of the New Yellow-ground Picotees, which obtained First-class Certificates and Awards of Merit at Newcastle-on-Tyne, London, Southampton, Oxford, and elsewhere during the past season. James Douglas obtained the unprecedented number of twenty-nine First-class Certificates and Awards of Merit in 1894.
Early Orders are solicited, as the stock of plants is limited. Orders will be executed in rotation as received.
EDENSIDE, GREAT BOOKHAM, SURREY.

PTERIS CRISTATA AND TREMULA,

In 48's, at 4s. 6d. per dozen.
A large quantity of the above: strong, healthy, young stuff. Packed free for cash with order.

B. PRIMROSE, Blackheath Nursery,
ST. JOHN'S PARK, BLACKHEATH, S.E.

PALMS, FICUS, FERNS, &c.—KENTIAS, fine, in 48's, 12s. per doz.; six sorts of PALMS, in 48's, 9s. and 12s. per doz.; Large KENTIAS, in 60's, 5s. and 6s. per doz.; eight sorts of PALMS, in 60's, 4s. and 5s. per doz.; do. in large thumbs, 3s. per doz., 20s. per 100; ARALIAS, in 48's, 5s. and 6s. per doz.; FICUS, in 48's, 12s. per doz.; CYPERUS NATALENSIS and ALTERNIFOLIUS, in 48's, 5s. per dozen; twelve best sorts of FERNS, 12s. per 100; ASPARAGUS PLUMOSUS NANUS, 6s. per doz.; variety of FERNS in 48's, 5s. & 6s. doz. Free on rail. Cash with order.—ALFRED MARTIN (late Lane & Martin), 5, Bramah Road, Brixton, London, S.W.

THE
Gardeners' Chronicle.
SATURDAY, AUGUST 18, 1894.

A SUBURBAN GARDEN.

THE garden I have in view is nothing more than a parallelogram, say of 50 feet wide and long, surrounded on three sides with walls 5 feet high, and on the fourth by the wall of the house, that is to say, a suburban garden of the back-yard type a little extended. Looking out from the upper windows of my house I catch glimpses of a score or two precisely similar in size and shape, half of them running parallel with mine, and the other half belonging to the folks in the next road, whose domiciles overlook us in a straight uniform row as far as the eye can reach. Now, it is very curious to note the diversity shown in the laying out of these areas. With some they are merely gravelled or grassed to form a play-ground for the children and dogs, or diversified with a path running round a square grass-plot, with maybe a narrow bed between the path and the walls. In others, trees form a feature, Poplars, Maple, and fruit-trees of various kinds, with here and there a Hawthorn. The large majority, however, especially in the winter, are bare of all attractiveness, and even in the summer are occupied by so many dozens of Pelargoniums, Calceolarias, and so on, which, however pretty individually, become monotonous by repetition. Looking down into my own, however, I find an altogether different state of things existing, and although it does not get a tithe of the care and attention it merits, yet it is so peopled with hardy herbaceous perennials and bulbs of all sorts that at all seasons it is worth walking round. In such a limited space, winding walks were hardly practicable, and therefore I adopted straight ones. Two rock-bordered beds have also a tile edging, within which the rockwork begins, consisting merely of a single row of burrs so placed as to support the extra six inches of soil behind them, while a number of species of alpine Saxifrages, Sedums, Campanulas, Dianthus, &c., find a congenial home in these interstices, and fill up the space between them and the tiled edge, so as to form a varied perennial border of green. This in the summer is scarcely ever out of bloom, and in spring a number of Saxifraga ligulata and cotyledon threw up their yard-long rockets of a thousand starlike blossoms, which annually form a feature of peculiar beauty. In the little isolated well-drained nooks which can be thus formed, a host of charming alpine species find a congenial home, and can be easily kept within their own bounds or from the encroachment of other species which would otherwise overrun them. The beds round the walls are elevated banks some 15 or 18 inches high, fronted with burrs and level on top, accommodating at once hundreds of the smaller-growing alpines in the rocky crevices, while in the level bed next the wall, Pæonies sweet-scented and ordinary, Phloxes, Delphiniums, Japanese Anemones, Iris, &c., hold their own from year to year, and are diversified in the

spring by a host of bulbs, Scilla sibirica, bifolia, and nutans; Chionodoxa Luciliæ, Triteleia uniflora (a gem deserving to be wider spread), Narcissi, Tulips, Fritillarias, Lilies of various sorts, &c. Lily of the Valley and Solomon's Seal have the run of two of the corners, the former including varieties with striped leaves and pinkish blooms. In the flatter beds the Queen of Flowers is represented by bushes in most of the corners; but, alas! though they hold their own year after year, they are too near the London smoke to be good representatives of her floral Majesty. Lilium Brownii, once introduced, has spread and multiplied for years, blooming well every season; L. auratum dies out persistently after a few years, sometimes thriving splendidly for two or three, and then ceasing altogether to put in an appearance. Three forms of Anemone japonica, the pink and white Honorine Jobert, and the original multipetalled red, are veritable weeds, and every spring have to be thinned out ruthlessly, the creeping bulbiferous roots developing all over the place, even invading the gravel. Harpalium rigidum is even a worse offender, and would soon oust everything. Fuchsias do splendid service, both as foliage and blooming plants, the long spikes of slender blossoms being extremely pretty. Alpine Auriculas take care of themselves almost entirely, and every spring make a fine show, far and away beyond their winter promise, when they look very wobegone. In the early days of spring, however, they start growing like Cabbages, and throw up their trusses in bunches in profusion. I have said they take care of themselves "almost" entirely, because in course of time they develop long fleshy stalks, which are apt to rot in the winter; it is therefore necessary from time to time to part the plants, and bury these stalks, bringing the centre of growth flush with the soil again. The Campanulas do good service; C. turbinata hybrida fills many a chink with its broad, shallow, light blue bells, for a long period in the summer; C. pulla, C. garganica, C. persicifolia, and a number of others, creep about, and yield crowds of blossoms, white and blue, of various shades, and of equally varied shapes and habits. A dozen bulbs of the Horsfieldii Narcissus, put in some years back, are now represented by a dozen huge clumps, the result of one removal last year, when a number were given away, so greatly had it multiplied. In this connection, and with reference to the luxuriant growth of some of the other plants named, I may mention that when, as has frequently been the case, I have thinned them out, and given plants of these to my neighbours, they have, as a rule, died out with them, and in no case that I know of have they flourished in like fashion, even though in careful hands. In seeking for the cause I am led to think it is due to an extra supply of lime in my subsoil. When my garden was laid out, it was done by contract to my plans; forty loads of soil from the neighbouring fields were introduced, and the beds duly banked up in readiness for the rockwork, which I did myself.

The following spring, before I had stocked the garden with bulbs, &c., I decided to give it a good digging, and started with a strong fork on that mission. Down went the fork about a foot, when it came against a hard immovable stone. I started a bit further on with same result, and to cut a long story short, found the stone everywhere at same depth. Inspecting the fork I found it white, and thus ascertained the cause. My garden had been the spot upon which an enormous bed of mortar had been mixed for all the surrounding buildings, and the conscientious gardener who carried out my plans had simply spread the imported mould over this deposit, which I eventually found was pretty evenly distributed, some 4 or 5 inches thick. This was eventually broken up, and is of course liberally mixed with the subsoil, providing an element therein which on 20 feet of gravel is entirely absent in the gardens around. Antennaria tomentosa, introduced about that time, became such a terrible weed that a couple of barrowloads had to be removed and burnt. Now it scarcely grows at all. Lilium candidum presumably objects to lime. I cannot get it to bloom at all, though close by L. Brownii thrives as I have described. Narcissus poeticus, single and double, is not a success, most bloom buds being blind; N. incomparabilis dies out in a year or two, but N. Horsfieldii, as I have said, grows as freely as a weed. I have omitted to mention that the brick walls and an 18-inch wooden trellis on top are covered all round with Ampelopsis Veitchii; this hides in the summer both wall and trellis almost entirely, and materially redeems its prosaic appearance. Of the pleasing and interesting fernery, and of the frames, I will say nothing, except that they house a unique collection of British varieties some 400 or 500 in number, with the merits of which it is not my fault if your columns, if not your readers, are not already familiar. On the rockwork under the shadow of the Fernery is an outdoor group of the sturdier varieties, and here and there in the garden itself a congenial home has been contrived. The Parsley Fern (Allosorus crispus) has nestled for many years under the north side of a big burr in one of the triangular beds; and actually the mountain Bladder Fern (Cystopteris montana), reputed a very difficult Fern to grow, and at any rate very rarely seen, has survived a three years' struggle for existence with its neighbour, Aster alpinus, in one of the rocky northerly nooks close by it; so much at home, indeed, do even Ferns appear amid this compound of rockwork and formality, that numerous self-sown seedlings have appeared in the chinks and established themselves robustly—all this, be it remembered, in dry Essex, and within a mile of Stratford's smoke and fumes.

During the summer, and when the foliage of the bulbous plants has died down sufficiently to be removed without detriment to next year's growth, I vary the scene with a few orthodox bedding plants, inserting them carefully myself where I know there is space. In such a garden, obviously the jobbing gardener can only be employed to do the rough work of sweeping up, grass-cutting and so on. Give him a free hand, supply him with spade and fork, and good-bye to all hopes of the perennial pleasures inherent in such a heterogeneous collection as this! Neatness, however, can be secured, even though it be impracticable to dig up and sort the garden so thoroughly as is generally done at the opening of the year. In the spring all the plants are in evidence, the clumps of perennials are showing life, and the bulbs are well to the fore. At this time, therefore, a little judicious hoeing, and even digging, can be done, and tidiness maintained, but later on, digging of any sort must be tabooed, or damage is sure to be done, and repentance ensue. *Chas. T. Druery.*

New or Noteworthy Plants.

LILIUM BROWNI VAR LEUCANTHUM, *Baker.*

This is a very distinct-looking Lily, the bulbs of which were received at Kew from Western China at the same time as those of Lilium Henryi and L. Browni var. chloraster. They were collected by Dr. Henry, and forwarded through Mr. Chas. Ford, of Hong-Kong. It differs from the other varieties of L. Browni by the perianth being without any tinge of red-brown outside, not being narrowed so gradually to the base, and tinged with pale yellow in the lower half inside. In the shape of the flower it much resembles L. formosum, Franchet, which is known only from dried specimens; but this is said to have erect flowers, petioled leaves, and yellow anthers. Perhaps our plant may prove to be a new species, but at present I only venture to describe it as a variety of L. Browni.

Stem 3 to 4 feet long, stiffly erect, green, glabrous. Leaves very numerous, spreading, linear, sessile, bright green, glabrous, distinctly three-nerved, the central ones the longest, 3 to 4 inches long, under an inch broad, the upper ones growing gradually smaller till the bracts are almost ovate. Flowers three to five in a close corymb, deflexed; pedicels erecto-patent, 1½ to 3 inches long; bracts ovate, similar to the leaves in texture. Perianth funnel-shaped, 6 inches long, 1½ inch in diameter at the middle, 3 inches at throat, rather rounded to the pedicel, the segments reflexing at the tip only, milk-white, slightly tinged with green towards the base and on the keel towards the tip on the outside, tinged with pale yellow in the lower half inside; nectarial groove long and green; segments permanently much imbricated, the outer 1¼ to 1½ inch broad, the inner nearly twice as broad, with the keel outside square and grooved down the middle downwards. Filaments 4 inches long, densely pubescent in the lower half; anthers oblong, ⅓ inch long; pollen bright brown. Ovary green, cylindrical, deeply six-sulcate, above 1½ inch long; style curved, above 3½ inches long, much overtopping the stamens, densely pubescent in the lower part.

It flowered at Kew this year in the open ground in the first fortnight of August. *J. G. Baker, Herbarium, Royal Gardens, Kew.*

Orchid Notes and Gleanings.

CYCNOCHES PENTADACTYLON.

This remarkable species is now flowering very profusely in the collection of W. W. Mann, Esq., Ravenswood, Bexley. It is carrying 152 male and female flowers. The wonderful contrast in the colouring of the male and female flowers makes the plant look most striking, and one can hardly imagine that they could be produced on the same plant. Mr. Simon, the gardener, is quite an expert in the growing and flowering of this Orchid, although it is one of the most difficult in cultivation to grow and flower successfully. *John Carvill.*

Orchid Anomalies.

Professor Penzig, of Genoa, has published in the *Mémoires de la Société Nationale des Sciences Naturelles de Cherbourg* (1894) an article on "Monstrosities in Orchids," in which he reviews the principal structural deviations that occur in this order.

Cattleya labiata alba.

The above extremely rare form of Cattleya labiata is in bloom at Mr. McArthur's Nursery, 4, Maida Vale, London, W. The flower measures 7 inches across; the petals are very broad; the lamina of the lip is much undulated; and the whole flower is pure white, with the exception of a pale yellow blotch in the throat.

Cattleya Rex at Stand Hall, Whitefield, near Manchester.

Mr. Thomas Statter and his gardener are to be congratulated that at this season of the year, when Orchid flowers are, even in very large collections, somewhat scarce, they should have such an abundance of beautiful flowers in the Orchid-houses. He is the fortunate possessor of ten fine plants of Cattleya Rex, all in fine health, and every plant is now in full flower, bearing respectively from one to four flower-spikes, with from two to five fine blooms, making a

total of forty-seven. It is a species which does not vary much, but one of the plants has flowers with a lip of rich amethyst, the throat ochre-yellow with radiating lines of claret-brown, terminating with a white fringed band.

In a house devoted to Lælias on the one side and Cypripediums on the other, there are in flower Lælio-Cattleya Amesiana, a specimen with eight flowers; Lælia crispa superba, the plant which last year was awarded a First-class Certificate by the Royal Horticultural Society, is finer than ever, having three strong flower-spikes, each bearing six flowers; L. elegans Oweniana is another gem. Other varieties of L. elegans in bloom were the beautiful L. e. excellens; L. e. Luciana, which is represented by a fine specimen carrying a spike with nine well-developed flowers; L. e. prasiata, another fine plant, carrying fourteen of its lovely flowers; L. e. Bluntii is represented by a plant with a spike of five fine large flowers.

The general health and condition of the collection is admirable. High temperatures are not the rule at this place, and sturdy growths are observable on plants usually grown in very high temperatures. The Dendrobium-house never exceeds 65° when artificial means are employed to heat the structure. *I. I.*

REMARKS ON THE FRUIT CROPS OF 1894.

[*For Tabulated Summary, see p.* 119]

(*Continued from p.* 151.)

3. ENGLAND, E.

Cambridgeshire.—The fruit crop in this district has been very indifferent. Pears of some varieties are extra good: Beurré Hardy, Williams' Bon Chrétien, Hessle, Beurré d'Amanlis, are very good crops on standard trees. Strawberries were very much damaged by hail. Bush fruit is a good crop here; but near to Wisbech they are light, and old bushes are much infested with red spider. The varieties of Plums, Early Rivers and Victoria, are good crops on young trees; but other varieties are a failure. *W. C. Smythe, Upwell House, Wisbech.*

—— The crops vary very much in this parish in quantity and quality. The frosts of the nights of the 27th and 28th of May did not cause very much injury, except to Strawberries and Nuts; but what we have to contend against are red spider and the caterpillar of the winter moth. The "spider" appears even before the leaves expand, and if not persistently followed up with a suitable insecticide, the bushes look as though scorched with fire. The winter-moth caterpillar is, if possible, still more to be fought against with another insecticide, and this must be done as soon as they are seen, or an almost total loss of crop will follow; but if taken in time very good results follow. *Andrew Grant, The Vineries, Willingham.*

Essex.—On April 21st I registered 9° of frost, 22nd 11°, and 23rd 10°, which made havoc amongst fruits, reducing the Pear crop to an average one, destroying almost all Apples and Plums, and three-fourths of the Strawberries. Gooseberries are a good crop generally in this district, but Currants suffered very much through blight. Morello Cherries and Raspberries are very good. All wall fruits escaped. *James Vert, Audsley End Gardens.*

Lincolnshire.—Up to the time of the frosts in May, fruit prospects were very good, Apples, Pears, and Plums having set a heavy crop of fruits, also all small fruits; but the frosts on that date and the 20th and 21st May cleared off all fruits—Apples, Pears and Plums fell off, also all small fruit. Wall fruit trees where protected have excellent crops, quite up to our usual average, particularly Peaches, Apricots, and Plums. *David Lumsden, Bloxholm Hall.*

Suffolk.—The fruit crop in this district, with two exceptions, Apples and Strawberries, is a good and plentiful one. Apples are partial and poor in quality. All the early bloom on Strawberries was destroyed by the frosts in May, consequently the crop is thin. Apricots are above the average, and promise to be very good. The same remark applies to Pears. Peaches, Nectarines, and Plums are fairly good, but Cherries, both dessert and Morellos, are thin. All kinds of small fruits are plentiful, particularly Raspberries. I do not remember having the latter so clean and fine in quality as this season. *H. Fisher, Flixton Hall Gardens, Bungay.*

Suffolk.—Apples erratic, in many districts good, especially on bush trees and cordons. Pears are emphatically the crop of the season, the frosts of May that wrecked so many Apples in bloom doing the Pears little or no harm. Cherries have also been plentiful. Plums variable, and about an average. Gooseberries fine crop, and the bushes in good health. *D. T. Fish, Bury St. Edmunds.*

—— Caterpillars were prevalent on Apple trees, and greatly disfigured the leaves; but Apples and all other fruit trees are making healthy clean growth. The Strawberry crop has perhaps proved the most disappointing. Apricot trees are heavily laden with fruit, as are also Filbert and other Nut trees. *J. Wallis, Orwell Park, Ipswich.*

—— I never saw a more promising year for fruit than 1894. Apples, Pears, bush fruit, &c., previous to the frost of May 20 and 21, when we registered 10° and 6° respectively—All fruit in the open was destroyed, but on the walls, Pears, Plums, and Cherries escaped, and in many cases the trees were so injured that they had the appearance of having been burnt, and many of them still bear marks of the injury. I may add that I have not one bushel of Apples left in the garden. *H. Coster, Ickworth Park Gardens.*

4. MIDLAND COUNTIES.

Bedfordshire.—The early spring pointed very favourably to abundant supplies of fruit until the night of May 20, when we had 9° of frost, but the foliage having got well advanced it took but very little effect on any, except Strawberries, and they have done really better than I at first thought was likely. *R. Calvert, Froxfield Gardens, Woburn.*

—— Apples are best on young trees and early sorts, although Kings are a fairly good crop, and Bismarcks are good. Early varieties of Plums are a slight crop, but the late ones are heavy. Cherries were a full crop, but the fruits much damaged by rain; and Strawberries were badly damaged by frost and mildew. The canes of Raspberries, owing to last summer's drought, are weak, and the crop is a short one. *F. Smith, Loddington.*

Bucks.—Of orchard trees the following are bearing good crops:—Devonshire Quarrenden, Blenheim Pippin, Wellington, King of the Pippins, Old Russet, Claygate Pearman. Our best Apples are on pyramid trees worked on the Paradise stock. Pears are an unusually good crop, nearly all varieties having to be severely thinned, both on wall trees and pyramids. Three kinds bearing indifferently are—Thompson's, Pitmaston Duchess, and Marie Louise. Peaches and Nectarines are a fair average crop, but green-fly was unusually troublesome during April and May. Cherries are a good crop, so also are Plums and Apricots. Strawberries suffered from May frosts, and are not half a crop, the worst being Noble, Sir J. Paxton, and President. Oxonian and Elton Pine are good, the latter especially bearing a heavy crop of fine fruits. Cob-nuts and Filberts are plentiful and good. *Chas. Herrin, Dropmore.*

—— On the whole the fruit crop is much below the average; Apples are bad and blighted. Amongst Strawberries there were many barren plants, and those in bloom suffered from frost in May, and the Raspberry bloom set badly. The bushes of Currants are very much blighted, and the Gooseberry bushes almost devoured by the saw-fly caterpillar. The Plum trees carry good crops, but the foliage is eaten up with aphis. The Peach, Apricot, and Cherry do not succeed on our sandy land. *G. Bloxham, Brickhill Manor, Bletchley.*

Bucks.—Apples in this district a poor crop; fruit generally small, owing to the effect of fly, which has dreadfully infested many trees. Pears are very abundant, and promise to be good. On Peaches and Nectarines the red-spider is proving very troublesome in many places. Plums will be a partial crop in low-lying districts; the whole crop was destroyed by frost in May, and in some places the foliage of the trees was completely cut off. Strawberries suffered from the same effect. All kinds of Currants materially damaged by the fly. Cherries fine, and most plentiful. Raspberries first-rate. *G. T. Miles, Wycombe Abbey Gardens.*

—— Here in the wet, low district we suffered badly from the severe May frosts, and but little fruit is left. Red and Black Currants are very thin, with hardly a whole bunch to be found, while from Strawberries not a fruit has been gathered. Warrington Gooseberry withstood the frost better than others, whose fruits lay under the trees by the bushel. Of Apples barely a fruit is left, whether sheltered or not. Part of the crop of Prune Damsons escaped (in places) with some of the coarser Plums; the Victoria suffered most, several years' growth being also killed. Of Walnuts there are none; some of the trees lost all their foliage. *J. W. Shrimpton, Aston Clinton.*

—— Up to May 21 we had every prospect of a grand crop of all kinds of hardy fruit. On that morning we had 8° of frost, which destroyed all the fruit, and cut the leaves off the trees. Many of our Plum trees are so much damaged, that it will take years for them to recover. *J. Smith, Mentmore Gardens.*

Cheshire.—Fruit blossoms were very abundant, early sorts promising till the night of May 20, when the thermometer at 2 feet from the ground showed 8° of frost, followed by bright sunshine. On the 21st there were 9°, and the 22nd 7°, and the temperature at night showed from freezing point to 6° from that date till the 30th. The greater part of the fruit-blossom was destroyed with a few exceptions. Protected Nectarines, Peaches, and Apricots on walls are good crops. For many years such a severe and late frost has not been experienced in this district. *Wm. Whitaker, Crewe Hall.*

—— Pears were well advanced before the frost came, and are a good crop; but the fruits will be rather small. Apples suffered very much, not only in loss of fruit but in the severe check received to growth, and blight has attacked them badly. Strawberries never looked better than in the early part of May, but the frosts on the 19th, 20th, and 21st completely spoiled all the early fruits. With the exception of Black Currants and Gooseberries, the bush fruit crop is a very good one, but is infested with the fly. *N. F. Barnes, Eaton Hall, Chester.*

Derbyshire.—There had never been a more magnificent prospect of an abundant fruit crop than was the case here up to May 20 and 21, when, in addition to very severe frosts, we experienced a terrific easterly gale, which completely ruined Apples, Pears, Plums, and Cherries, with the exception of a very thin sprinkling of Morellos, so that of Apples we have not a single fruit left, and Pears only a few on the walls. Small fruits, with the single exception of Gooseberries, which are a grand crop, were all seriously crippled, and are very poor indeed. *B. Ashton, Glossop Hall Gardens.*

—— A very poor show of fruit all round, except Pears, which are a fair crop and healthy. No bloom on Apples, or, rather, very little, no doubt owing to the long-continued drought (on a dry subsoil) of last summer. Black Currants quite spoiled with the green-fly. Damson Plums, of which a great quantity is grown in this neighbourhood, are almost a failure. *E. Wilson, Hardwick Hall Gardens.*

Hertfordshire.—There is a fair display of fruit in this district, some of which is remarkably good. Trees of the following varieties of Pears, Marie Louise, Brockworth Park, Duchesse d'Angoulême, and Glou Morceau, are carrying capital crops. Many

*

of the small fruits were much damaged by the May frosts, Strawberries particularly; moreover, Red and Black Currants have been badly infested with green and black-fly, and their injurious effects upon the foliage have, in some places, spoilt the crops, and killed the trees. *C. E. Martin, The Hoo Gardens, Welwyn.*

Hertfordshire.—The frost of May 20 completely destroyed our Apple, Pear, and Plum crops where exposed. Pears on walls, and where protected, were above average, and required much thinning. Plums similarly situated are about half a crop. Strawberries and bush fruits suffered severely, although in the case of Currants and Gooseberries sufficient were left for a good average crop; the former are much blighted. Sweet Cherries were all destroyed, and Morellos are a poor crop. *E. Hill, Tring Park.*

—— Fruit crops were very promising till the severe frosts the latter end of May played such havoc amongst them. Nearly all the best Strawberries were cut off, and although the Peaches and Nectarines did not suffer so much here, in many cases in the neighbourhood the trees look nearly dead. Apples, Black Currants, Strawberries, and Walnuts, suffered most here. I do not think we could get a peck of Walnuts from about a dozen trees, and before the frost they were covered with them. Pears and Filberts are the most promising crops, Woodnuts are plentiful. *Thomas Nutting, Childwickbury.*

Leicestershire.—We have here quite an average crop of all kinds of fruit, with the exception of Apples and Pears on standards. Pyramidal trees of the following are carrying good crops:—Apples: The Queen, New Hawthornden, Wellington, Blenheim Orange, Newton Wonder, Prince Albert, Duchess of Oldenburgh, Domino, Stirling Castle, Frogmore Prolific, Bramley Seedling, Braddick's Nonpareil, Pike's Pearmain, Lord Lennox, and Sturmer Pippin. Pears: Beurré Superfin, B. Brown, B. Rance, B. d'Amanlis, B. d'Anjou, B. Diel, Doyenné du Comice, D. Boussoch, Souvenir du Congress, Williams' Bon Chrétien, Knight's Monarch, Louise Bonne de Jersey, Marie Louise, and Marie Louise d'Uccle. *A. Hamshere, Beaumanor Park Gardens, Loughborough.*

—— Apples flowered but sparingly, and since May 20 have been very much blighted, doubtless owing in some measure to exhaustion after the very heavy crop last season. Pears are very full of fruit, and in good health. Plums were much blighted, but are now improving. Cherries set well, and afterwards got much infested with black-fly. Peaches are promising well. Apricots very heavily laden, making two heavy crops in succession. Black Currants almost disappeared after the frost on May 20 and 21. Gooseberries were also much thinned at that time, and the largest flowers on Strawberries were killed. *W. H. Divers, Belvoir Castle Gardens.*

—— The 9° of frost of May 21 and 22 destroyed the Apple crop in this neighbourhood, and very much reduced that of Strawberries, Raspberries, and bush-fruit. Of Pears on pyramids there are none, but on walls there is a large crop of clean fruit. Peaches and Apricots are better than we have had them for some years. *D. Roberts, Prestwold Gardens, Loughborough.*

Nottinghamshire.—On May 20 we registered 9° of frost, and on the 21st 6°, completely destroying the Apple and Pear bloom, which looked very promising. Peach, Nectarine, and Apricot trees were well protected with two thicknesses of fish-nets, and Cherry bloom not being forward, they escaped. Strawberries were nearly in full bloom, and the crop was nearly destroyed. *S. A. Woods, Osberton Gardens, Worksop.*

Oxfordshire.—Apples were at one time a very promising crop, but blighted badly, especially the older standards. Pears are wonderfully good in all forms of culture. In the case of heavily laden trees many fell naturally; in addition to this it has been necessary to take off at least a third of the crop. Peaches and Nectarines are excellent crops, others healthy; frost did not hurt fruit crops here. Cherries good, but much troubled with black-fly, especially Morellos. Plums are a heavy crop on all trees; immense crops of Gooseberries, and not a caterpillar here. Red Currants blighted badly. Strawberries here, especially President and James Veitch, are very fine. *George Stanton, Park Place, Henley-on-Thames.*

Oxfordshire.—The failure of the Strawberry crop must be put down to the great heat of 1893. Walnuts failed by reason of spring frost destroying the bloom and young shoots; and the partial failure of Apples is due to the same cause. *A. Long, Wyfold Court Gardens.*

—— Of Apples I don't think we shall gather one bushel. Pears escaped on the walls in some places, and some standards or orchard trees have a fair crop. Plums are a fair crop on walls, but there is none on standards. I gathered a fruit of Alexander Peach from a south wall on July 11th. Strawberries were all killed. *W. M. Geddes, Shirburn Castle.*

—— Apples are a partial crop, but good in quality; our best are on young standard trees four years planted. Those fruiting the most freely are Alfriston, Stirling Castle, Lord Suffield, Warner's King, Ecklinville, Tower of Glamis, Mère de Ménage, Beauty of Kent, and Lane's Prince Albert among culinary varieties; and Irish Kerry, Keddleston, Sturmer and Blenheim Pippin among dessert fruits. The best Pears are Beurré Diel, B. Bachelier, Easter Beurré, Duchesse d'Angoulême, Conseiller de la Cour, and Glou Morceau. *A. G. Nichols, Nuneham Park Gardens, Abingdon.*

Shropshire.—Such Apples as King of the Pippins, Stirling Castle, and a few of the older sorts are carrying full crops; but, taking Apples as a whole, they are decidedly under average. Strawberries are a grand crop in every way. *James Louden, The Quinta, Chirk.*

Staffordshire.—The frost (May 20 and 21) no doubt did much damage, still I am of opinion that the superabundant bloom being so great a tax upon the trees, and the want of moisture in the subsoil, were more directly the causes of the failure of the Apple and Pear crops. In some gardens near here Plums had dropped wholesale before the frost. Strawberries badly injured by frost. Apricots and small fruits more protected by foliage escaped. *Arthur Coombes, Himley, Dudley.*

Warwickshire.—Apples are a complete failure, owing to the May frosts; on the contrary, trees of Pears on walls and espaliers are heavily cropped, and Plums and Damsons are a thin crop in orchards, and on walls a heavy one. Peaches are a full crop, and promise to be of fine quality. Apricots are again an extraordinary crop, and the trees are clean and healthy. *J. Rodger, Charlecote Park Gardens.*

—— The only real failure among fruit crops this year is with Strawberries; the severe frosts in May utterly ruined the prospects, which were then good. In a few instances plantations are almost uninjured, and have yielded excellent crops of very fine fruits; such exceptions are, however, extremely rare. Apples set a very heavy crop, but most of the fruit dropped in a young state through injury by frost. Pears, on the other hand, were quite uninjured, and are plentiful and good in every way. Plums were at one time a very heavy crop, but severe attacks of green and white aphides so weakened the trees that they resorted to Nature's remedy of casting their fruit to restore the balance. *H. Dunkin, Castle Gardens, Warwick.*

(To be continued.)

THE ROSARY.

CLEMATIS AND ROSES.

We seldom see other beautiful flowering plants growing together with Roses, except it be more or less of an accidental arrangement over some cottage wall or door. When we admit at once how harmonious the two are, is it not strange we fail to copy the same as far as possible? In scarcely any form of Rose culture, except that where a few grand exhibition blooms are needed, will the Clematis be out of place. A few old and strong-growing Roses, rambling at will over an outhouse here, have been exceedingly pretty all through the early part of summer. Even now there are several expanded blooms, and more to follow. But what forms the chief feature of present attraction is undoubtedly a grand specimen of Clematis Jackmanii. Again, a rough pergola in a neighbour's garden is beautifully covered with various Clematises and Honeysuckles. Roses were the feature a short time back, but would make a sorry show now in comparison to the gorgeous Clematis. I will quote one more example in favour of these mixture. A bed of pegged-down Roses surrounding a large Cydonia japonica is also planted with a few Clematis. Early in spring the deep scarlet of this Japanese Quince is very effective, and at a time when little else is showy. The Roses soon follow, and are in their turn succeeded by the Clematis, which not only converts them into a beautiful bed, but also rambles among the Cydonia and around the taller and stouter growths of the Roses.

Nothing could be more simple to grow than these flowers, and few harm one another less. Each spring the Roses are pruned, and pegged down after a fairly good mulching. By this time we can see where the Clematises are, and so avoid any undue injury. For that matter, we need have little fear if the Jackmanii section or type are used, these being more or less herbaceous perennials, and blooming upon the present season's growth. A few of the roughest shoots are pulled out of the Cydonia at the same time, when it only remains for each to come on in due season, and we secure three distinct and pleasing changes with no more trouble. We do not find them harm one another when accidentally placed or allowed to grow together, and yet so many fear to form these delightful mixtures. *P.*

WILD BIRDS.

I cannot put my hand on the schedule of the Wild Birds' Protection Act just now, but so far as my memory carries me, the owl is catalogued only as an owl. Does that include the whole family, from the noble eagle down to the lesser or common barn owl? Why I select the owl in the first instance is, that this district is getting pested with the brown field-mouse, as well as the shrew-mice. Every bank is honeycombed with their runs. The destruction last season was great, but to all appearance it will be more so this season. Those who have watched the barn-owl in the twilight of a summer evening, as it silently glides in search of its legitimate prey, rats and mice, and those who have visited their nests and counted the numbers carried there, especially during the breeding season, would be convinced of its value. It is no uncommon thing to find from twenty to thirty brought in during the night, including rats, mice, sparrows, robins, to say nothing about what the owl needed for its own consumption. Useful as these birds are, there are few land birds that suffer more on account of their beauty. Bird-stuffers especially destroy scores of them, as they always command a ready sale when stuffed and put into glass cases; their wings are much used for fans, fire-screens, and are worn in ladies' hats and bonnets. Formerly these birds were much cared for in Sussex and Kent. Holes were always made in the barns, granaries, and often in the roofing of old farmhouses for the ingress and egress of barn-owls.

Rooks.—These birds have the credit of destroying a large percentage of corn. If any patches are to be found in the fields, the farmers always say it is the rooks, but if they were to watch them minutely, and open the crop of those that fall to the gun (which is often the case), they would find chiefly wireworm, grubs, and maggots, showing at once that they do an enormous amount of good when procurable they feed almost entirely on worms. Anyone can easily learn for himself that worms destroy the fertility of the soil, if he tries to grow plants in mould formed

entirely of worm-casts. Rooks do an enormous amount of good also by eating the grubs of the cockchafer, this has been proved frequently; where rooks are colonised, there the chafer is rare, they seem to detect their whereabouts by the sound of their "teeth" at work on the grass roots, and then pecking a hole with wonderful rapidity they drag out the grub.

The Starling.—This valuable bird is not in the schedule. I look on starlings as among the best friends I have, more particularly in districts where rooks are not colonised and seldom seen. The presence of the starling is not appreciated near Cherry orchards during the time of ripening; but apart from that, they do an incredible amount of good. They feed almost entirely on worms and grubs, particularly the grub of the Daddy-longlegs (Tipula oleracea). Grass often suffers considerably from these grubs; the yellow cabbage-butterfly and grubs also do not escape the starlings when they have young. In meadows that are infested with the cockchafer, you will see a whole pack cleaning them off by the myriad.

It is delightful to watch the tactics of these birds in a meadow, and note how curiously they feed, the hind ones continually flying to the front, by which means they can observe the holes of the insects in the ground, and hear the gnawing of others, from which their sharp-pointed beaks quickly draw forth the occupant.

The Kestrel.—This is another bird of great service for destroying mice, young rats, and nearly all large insects, such as cockchafers, &c., but this useful species is getting rare, for no sooner does it appear, than every endeavour is made to trap and shoot it. If they do have a young partridge, pheasant, or chicken occasionally, they well compensate for it. I reflect that the majority of these and many others would not possibly have had existence had it not been for the searching eye for vermin, and I trust the former-named bird, and the latter, will find more friends in the future than in the past, for without them we shall be in a sore plight in a short time. *A. Evans, Lythe Hill.*

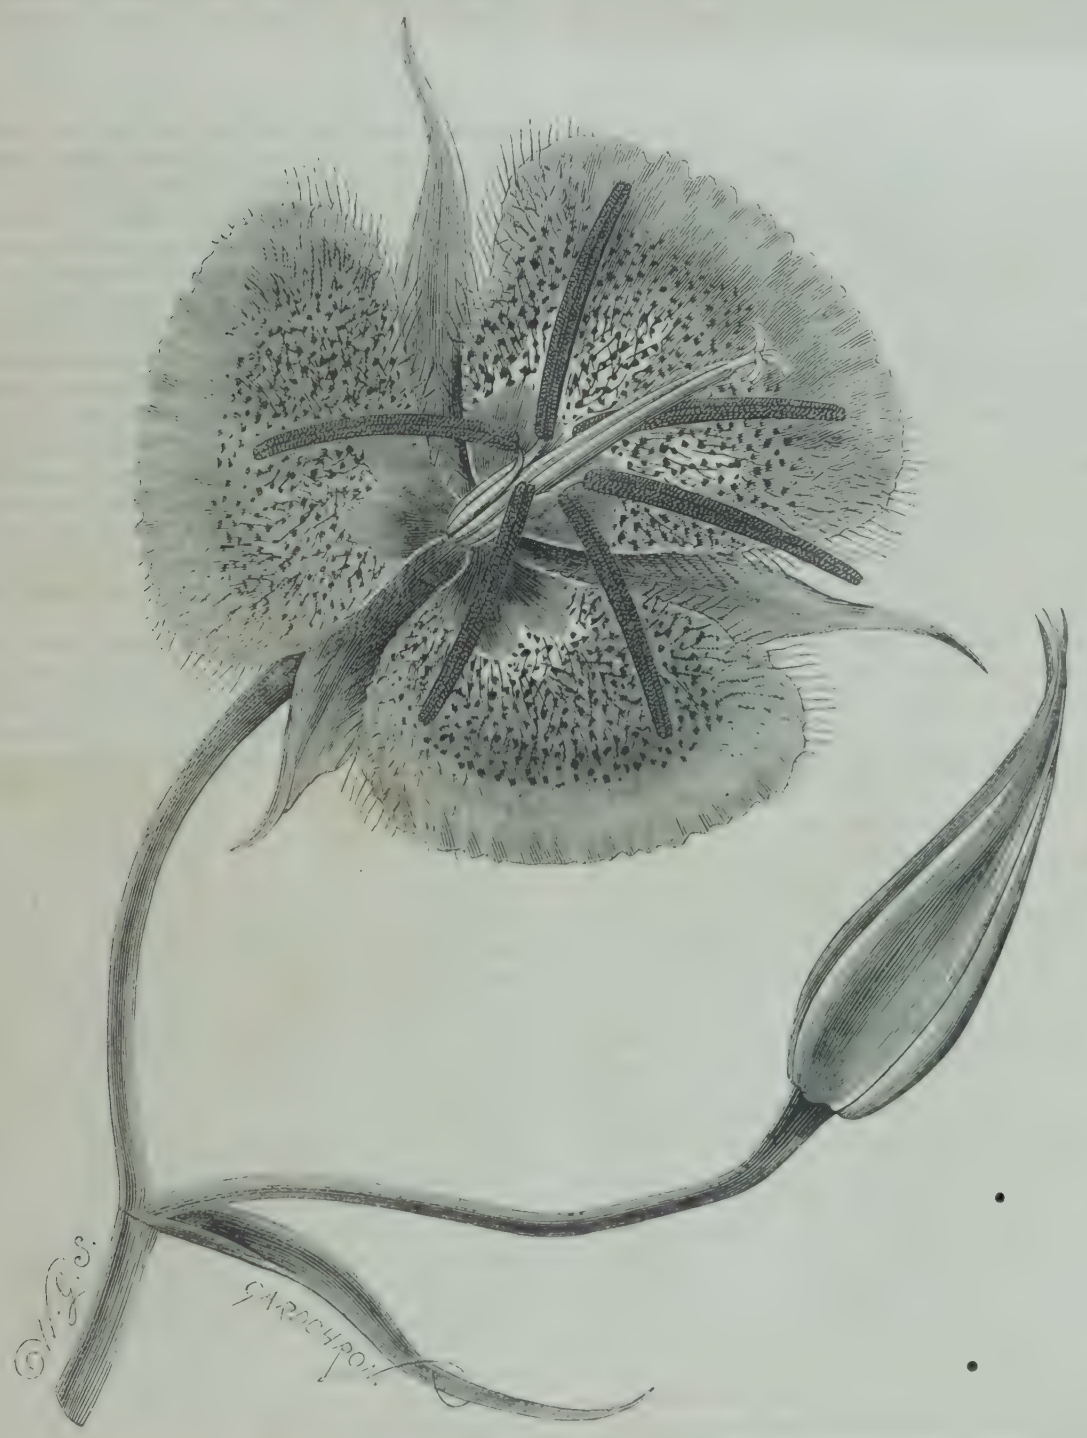

FIG. 27.—CALOCHORTUS WEEDII: FLOWERS YELLOW.

CALOCHORTUS WEEDII.*

THIS is a yellow-flowered Californian species, lately exhibited before the Royal Horticultural Society by Messrs. Wallace & Co. of Colchester, to whom we are indebted for the opportunity of figuring the plant. The rich yellow self-colour affords a contrast to the many-hued flowers of other species. It has also been called C. citrinus. Mr. Baker considers the present plant to be a variety of C. luteus, differing in the circumstance that the petals are not spotted, whilst their whole surface, not a part only, is covered with long brownish hairs. The flowers are described as "saturate aurantiaca," but as shown the colour was pure yellow (flava).

* C. Weedii, Wood, *Proc. Acad. Phil.*, 1869, p. 189; C. luteus, Douglas, var. Weedii, Baker, in *Journ. Linn. Soc.*, vol. xiv., p. 309.

TREES AND SHRUBS.

SPIRÆA BUMALDA.

THIS is a very dwarf shrub, not more than 18 to 23 inches in height. The flowers, which are rosy-pink, are produced in great profusion, and last a considerable time. Planted in open spots in mixed shrubberies at a suitable distance from the edge of the border, or if used as a flowering plant for groundwork amongst neatly-kept ornamental shrubs, the effect is very pleasing. Cuttings of young shoots may be rooted under a close handlight, and will soon grow into nice-sized plants. [The variety of this species called Anthony Waterer is much better.—ED.]

SPIRÆA CALLOSA ALBA

also grows to about the same in height, but the flowers are pure white, making it a suitable companion to the above-named. The flowers of both are produced with large flat heads, and might be used in several ways with good effect.

SPIRÆA NOBLEANA

is a much taller and stronger-growing shrub, and when planted in a suitable spot, produces a very fine effect. The flowers, which are produced at the ends of the shoots in large-branched heads, are of a rosy-red colour, and the plant may be said to be one of the best of its kind.

RHUS COTINUS (COB-WEB OR WIG TREE).

We have a nice shrub of this now smothered with its purplish feathery inflorescence, which is now a striking feature in the shrubberies. It is growing in a somewhat poor light shallow soil. To see this shrub in its full beauty, it should stand well clear of its neighbours, and never be allowed to get over-crowded. *H. Markham, Merewort[illegible] Cast[illegible].*

FRUIT-WINES.

THERE has recently been published, in a large volume of 462 pages, the report of the thirteenth meeting, at Breslau, of the German pomologists and fruit growers, and of the German Pomological Society. Two reports, devoted to the present condition of the wine-making industry in Germany, are of considerable interest. After many experiments, it is now possible to make, with proper materials, a good, pure, palatable beverage. There are a great many kinds of barms or yeasts (Saccharomyces), but not all give a good result. The Saccharomyces apiculatus, which is formed in the fruit-juice, is not sufficient to ferment the juice thoroughly. Therefore it was necessary to find varieties of barm which would answer the purpose better. Experiments showed that there are better barms, and moreover, that if the juice ferments by means of these in a few days, the above-named apiculate barm is not formed. The experiments proved further that the different species of barm have biological peculiarities, viz., that different varieties impart varying flavours to the beverage. So it is possible to give to the same juice a different bouquet or flavour, according to the kind of yeast with which it is fermented. The next problem was to raise pure specimens of the different varieties of barm, and to test these in the juice. That was done, and now fruit-juices are fermented by barm obtained from Grape-wine. To suppress the original apiculate barm, which is chiefly formed in the fruit-juice during the first few days, whilst the quantity of alcohol is still small, a small quantity of ammonia tartrate (20 grammes per hectolitre) is added to the juice (1 gramme = 15 grains, 1 hectolitre = 22 gals.). Besides this, the quantity of

barm added to the juice is of great importance. The same quantity of Gooseberry juice during twenty-four hours gives the following results :—

Quantity of Barm.	Quantity of Carbonic Acid.	Quantity of Barm.	Quantity of Carbonic Acid.
	Grammes.		Grammes.
Spontaneous fermentation ...	16·20	Spontaneous fermentation ...	17·00
25 cub. cent. barm	24·00	25 cub. cent. barm	25·30
50 ,, ,,	30·40	50 ,, ,,	34 50
75 ,, ,,	35·80	75 ,, ,,	40·90
100 ,, ,,	42·00	100 ,, ,,	44·80
125 ,, ,,	50·90	125 ,, ,,	53·50
150 ,, ,,	58·00	150 ,, ,,	60·00
200 ,, ,,	64·20	200 ,, ,,	66·60
250 ,,	68·50	250 ,, ,,	73·20
300 ,, ,,	78·20	300 ,, ,,	81·70

As soon as the juice has 5 or 6 per cent. of alcohol, the greatest difficulty is surmounted. Experiments have shown that it is very advantageous to add to the juice at the beginning 2 per cent. of alcohol, or still better 10 to 15 per cent. of Grape wine. Then the fermentation by pure barm raised from Grape wine goes on very well, whilst spontaneous fermentation ceases, because the original apiculate barm is killed. As the juice of fruits, especially that of Gooseberries and Currants, contains a great quantity of acid, it is necessary to dilute it with water. Now the experiments proved that, the more water is given, the worse grows the barm. The following table demonstrates this :—

Juice of Gooseberry with—	Amount of Carbonic Acid after 70 days without Barm.	Amount with Barm.
	Grammes.	Grammes.
6 per cent. acid	174·0	297·3
8 ,, ,,	161·3	279·5
10 ,, ,,	137·1	262·9
12 ,, ,,	104·2	237·0
14 ,, ,,	94·8	193·9
16 ,, ,,	90·2	184·7
18 ,, ,,	80·8	168·9
20 ,, ,,	74·0	153·3

But if the concentration of the juice increases in proportion to the quantity of acid, this promotes fermentation, as the following table explains :—

Concentration of the Juice.	Acidity.	After Fermentation.	
		Total Amount of Carbonic Acid.	Total Amount of Alcohol.
	Percent.	Grammes.	Per cent.
36 parts juice ... ... 64 parts dilution of sugar and water	4	154·1	7·30
48 parts juice ... ... 52 parts sugar and water	5·1	173 3	8 40
68 parts juice ... ... 32 parts sugar and water	6·5	193 9	9·45
72 parts juice ... ... 28 parts sugar and water	8·1	213 1	10·34

For practical purposes these results are of much importance. The juice is fermented by pure cultivated barm and by the proportion of water which is necessary to reduce the acidity. Afterwards the remainder of the water is added. From all these experiments, Mr. Nathan, Inspector at Rottweil, deduces the following rules for the making of wine. Of the first fruits which are obtainable, 3 to 4 kilogrammes (1 kilo. = 2¼ lb.) are thoroughly washed in cold water, pressed, and the juice mixed with fresh pure cultivated barm. Fermentation is allowed to begin in a glass bottle of 3 to 4 litres (1 litre = 1½ pint). Some days afterwards 2 to 3 litres of fresh juice are mixed with the fermenting juice, and the mixture enclosed in different glass bottles. This process is repeated several times, till a sufficient quantity of barm is obtained. Then begins the wine-making proper. The fruit is pressed or crushed, the whole mass together; with the skins of the fruit is mixed half the quantity of barm, and it is then placed in large vats with sieve-bottoms. Some days afterwards the juice is pressed out, and mixed with the second half of the barm. Now begins a very active fermentation. Some three or four days afterwards the must is brought in another barrel, and mixed with the necessary quantity of water, sugar, and ammonia tartrate. The succeeding crop of fruit is brought in the first barrel, where is still a good proportion of the barm. Shortly after the first must is fermented, the wine is put into another barrel, and this in an underground cellar. The remaining barm is used for the succeeding crops. Presently such a large quantity of barm is raised that it is sufficient for a great deal of juice. The first crops are the white Currants, then follow the red ones, and after these the American Gooseberries. By this method it is possible to complete the whole wine-making four weeks after beginning in the underground cellar. The barm from the last barrels is used for the fermentation of the Apple-juice. It is necessary to bring the wine, as soon as all sugar is fermented, from the warmer fermentation cellar into the cooler underground chamber, where the clearing process begins.

The best Gooseberry for wine production is the American Mountain Gooseberry (a variety of the common Gooseberry). A plantation, three years old, gives per hectare (1 hectare=2½ acres) 8254 kilogrammes berries, that yield, by a mixture of 2·7 litres water with 1 litre juice, 234 hectolitres wine per hectare. This species is no new one, but known here in Germany, as was remarked at the Congress, over twenty years ago. It is proof against disease. The importance of the fruit and berry wine industry is considerable in Germany. Besides the cider, the Currant wine production is increasing immensely and the latter is now often given by physicians in a great many hospitals instead of the much more expensive Tokay wine. *U. D.*

NURSERY NOTES.

MESSRS. PAUL AND SON.

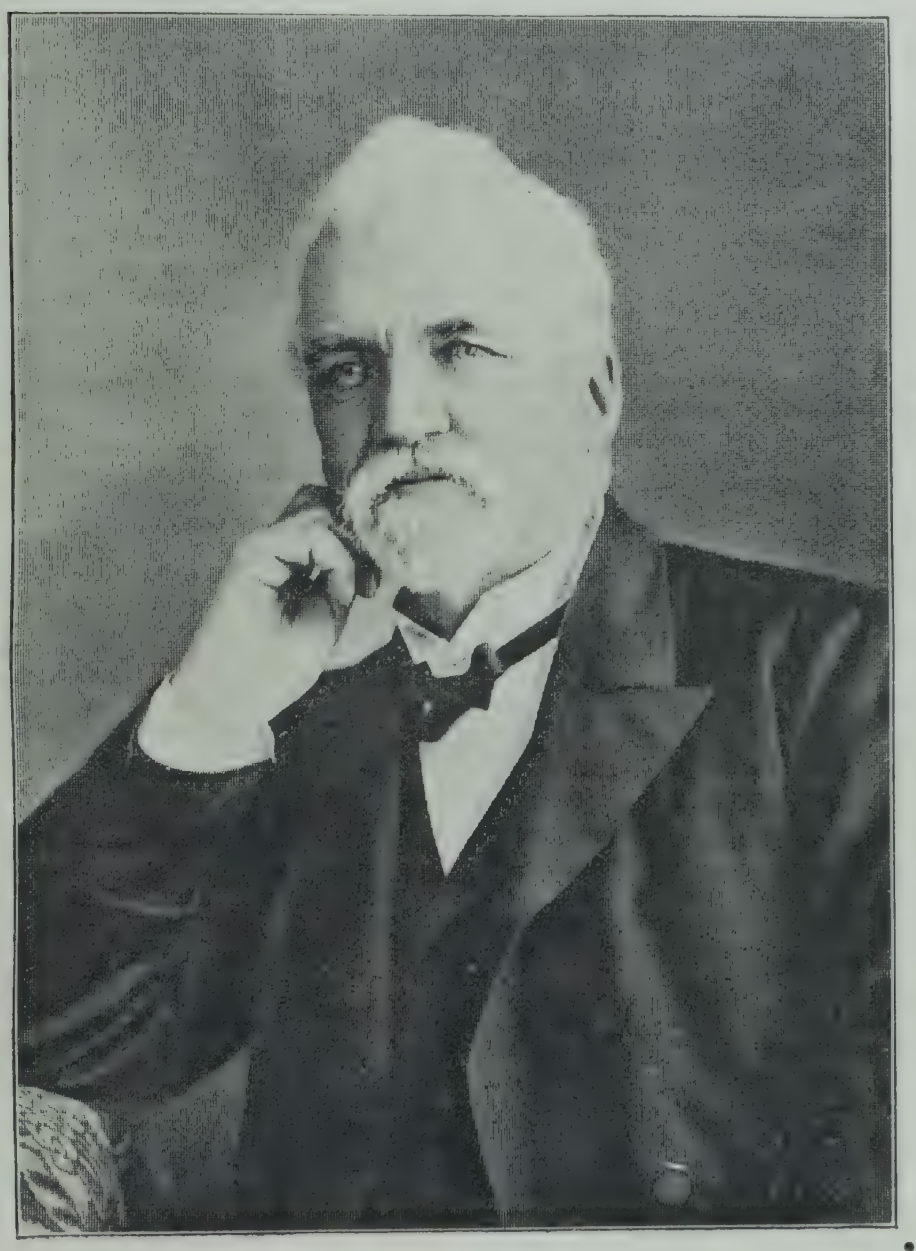
The Roses in the Cheshunt Nursery were for the most part in full flower recently, and there is a fine promise of an autumn display this year, the plants being in vigorous health, and full of plump buds. Roses are as enjoyable in autumn as in summer, the flowers often better in colour, because less affected by bursts of a long-continued hot sun.

It is needless to write that every variety in every class of any merit at all is grown. To enter into details about old varieties is unnecessary, and therefore the remarks are confined almost exclusively to new kinds, either raised by the firm, or by other rosarians. Of those specially identified with Messrs. Paul & Son, the most famous is Carmine Pillar. The name is not altogether happy, though fairly descriptive. It is a Rose that will no doubt be grown largely in the future, as we have none too many really fine climbers. The growth is remarkably robust, some plants over 10 feet high, being earlier in the season, wreathed with the large, rich carmine crimson-coloured flowers, which last well for a single Rose. They are also sweetly scented, and the plant when in bloom is splendid. Flowers of it have been shown on many occasions by the firm, but one cannot judge from these of the effect produced by a plant in the open. Charles Gater is a very promising hybrid-perpetual variety, given an Award of Merit by the Royal Horticultural Society in 1891. The plant is a strong grower, with broad robust leafage, and the brilliant scarlet flowers are well-formed and very sweetly scented. It will make a thoroughly good garden Rose. Another raised by the firm is Paul's Early Blush, which is possibly a sport from Heinrich Schultheis, but much lighter in colour. The fragrant flowers appear very early in the season, and are produced far into the autumn, the light silvery pink colour being very pleasing. We should think that it will be grown largely for market, because of its earliness and adaptability for forcing. Caroline Testout is in all probability a seedling from La France. It is one of the finest of recent new flowers, the growth of the plant very strong, and the flowers full, fragrant, and delicate salmon-pink in colour.

A very promising variety of the H.P. class is T. B. Haywood, a welcome dark Rose, the flowers best described as scarlet-crimson shaded black, a superb depth of colour, in addition to which they are of full form and very sweet; the plant, too, of strong sturdy growth. Duke of Fife, a deep-coloured Etienne Levet, will be in time a distinct gain, the flowers very rich in colour, crimson, touched with maroon. Violet Queen is promising, and is very distinct, the flowers of excellent form, and rich crimson colour, touched with quite a violet tone. Captain Haywood, the late Henry Bennett's last Rose, is a brilliant flower for colour, bright carmine scarlet, the growth of the plant strong and free.

Perhaps the finest Rose raised of recent years by Messrs. Paul & Son is the Bourbon Mrs. Paul; it is superb everywhere in this Nursery, being good as standards and in other forms, whilst it may be also treated as a climber. One standard of it had, not long since, twenty-five flowers of perfect form open at one time, showing that it is at once free and vigorous. The flowers are of quite Camellia-like form, the stout petals composing a full handsome bloom, bluish-white, touched with a delicate peach shade, of the fine Bourbon character, sweet, and continuing long in beauty; it is in every way a thoroughly fine garden Rose. La Fraicheur is a charming hybrid Tea Rose, but, unfortunately, is a very poor grower, this being of course a great drawback; but the plant is worth growing to get even a few flowers, as they are so fresh and clear in colour—a lovely bright shade of rose, quite distinct from anything else in cultivation.

The Teas were of much interest, the plants flowering remarkably well, amongst the newer kinds Beauté Inconstante being very distinct in colour, variable, and most pleasing when of an orange-red shade, the plant being strong in growth. This, we think, will be much grown in the future, the flowers, so variable in colour, passing sometimes to white, yet not commonplace, reminding one of L'Idéale more than any other kind. Elise Fougier is a fine true Tea, the flowers very pretty in form and colour, being not unlike those of Niphetos, and delicate lemon in shade. Bridesmaid has been written of lately; it is a sport from Catherine Mermet, but deeper in colour, and does not lose its distinctive shade so quickly as that variety, whilst the growth is more vigorous. Naman Cochet is a Rose that will in time, we think, get popular. It blooms abundantly, and the flowers are of pretty colour, salmon-pink, touched with yellow.



Amongst hybrid perpetuals, Marchioness of Londonderry must not be omitted. It is a very handsome Rose, sweet, and with stout petals, ivory-white, tinted with delicate pink in the full, firm centre. The flowers are produced freely on the stout, vigorous shoots, and either for the garden or exhibition it will prove valuable. We do not care greatly for the colour, because rather a dirty-white, but it is free, vigorous, and in other ways distinct and attractive.

A few more Hybrid Teas may be mentioned, one of the brightest being Marquis of Salisbury, which is at once apparent by its dark purplish leaf, dwarf growth, and brilliant crimson flowers, which are as bright as anything amongst Roses. It is a free, brilliant, and useful variety, likely to be much grown in the future. Augustine Guinoisseau is now fairly well known. It will never make an exhibition Rose, but is very beautiful in the autumn, the compact, strong-growing plants bearing a wealth of very fragrant flowers, white-tinted pink in the centre, and popularly called the White La France. Kaiserin Augusta Victoria is a hybrid Tea, like a fine form of The Bride, and will probably supersede that variety. The flowers are large and long, the colour a very soft lemon shade. Grand Duc de Luxembourg is the counterpart of Viscountess Folkestone, except in the colour of the loose, delightful, informal flowers, which are rose. It is a strong grower, free, and a variety

that will be popular for beds. Of Viscountess Folkestone it is not necessary to say more than that no Rose is more beautiful. One cannot get tired of its lovely flowers. A new Rose of great beauty, and recently given an Award of Merit, is a seedling raised by Mr. A. H. Gray, of Bath, and called Alister Stella Gray. It blooms like a Noisette, in clusters, and both early and late; the flowers very pretty in the bud, the centre of a lovely Apricot shade, passing to white when fully expanded. It will be found valuable for cutting, the long pretty buds being of great use for button-holes, and whether under glass or in the open it is very fine, the growth robust, quite of climbing character, and the flowers produced with much freedom.

Besides the beautiful climbing single Rose, Carmine Pillar, already described, several Noisettes or hybrid forms, very much like true Teas, are of note, as this Nursery is rich in such types. Gustave Regis is one of the best known. It has exquisite buds, long-pointed, and yellow-orange in the centre, the colour getting lighter as the flowers expand. Madame Pernet Ducher is delicately scented and coloured; and then we have such kinds as the Climbing La France, and Oakmont, an American climbing Rose, the flowers brilliant rose in colour, and very pretty. It is reputed excellent for under glass in winter. A new hybrid, with much of the China character about it, is Frances Bloxam, a charming pillar Rose, flowering freely in summer and autumn, the colour salmon-rose, a distinct and clear shade.

As those who visit exhibitions well know, Messrs. Paul have a fine collection of garden Roses, such as Janet's Pride, the Sweet Briar variety shown by them so well at the last Temple show; the flowers are semi-double, touched with crimson, and striped with a brighter shade. It will make a good hedge Rose. The Polyantha varieties were in full bloom. Two splendid plants of the Prairie Rose, Rosa setigera, were very beautiful on stout stakes, over which the growth had rambled; an abundance of flowers were produced, displaying various shades of rose—a fine garden Rose, such as one would like to see more of. Also in flower was a Rose called Rasanlich, from which the otto of Roses is procured in Bulgaria, a double, very sweet-scented form. All the Rugosas are grown; one, the American form, with very large crimson fragrant flowers. One might, however, write a volume on the fine old garden Roses grown in this Nursery. *Visitor.*

CHARLES MOORE, OF SYDNEY.

CHARLES MOORE.

There must be some occult co-relation between the name of Moore and the study of botany and horticulture. There was David Moore of Glasnevin, and he was succeeded by his son "Fred," who presides over the garden in a fashion worthy of his lineage. There was Thomas Moore of Chelsea, and of the *Gardeners' Chronicle*, of Fern repute, but an indefatigable worker in most branches of horticulture. There is Spencer Le Marchant Moore, well known in botanical circles; and afar off, but often brought to mind, is Charles Moore, of the Sydney Botanic Garden. Of him and his work we had occasion to speak when chronicling the awards of the Veitch medals, but we were not able at the time to present his portrait with those of the other medallists. We are now, however, in a position to do this. We may refer to our previous notice for some details as to the career of Mr. Charles Moore, who is a brother of the late Dr. David Moore of Glasnevin. It must suffice here to recall the fact that Mr. Moore has had the direction of the Sydney Botanic Garden for forty-six years, and is now the only public servant in any of the Australian colonies appointed by the Imperial Government. Mr. Moore was recommended for the post in 1847 by the late Dr. Lindley, Editor of this Journal, to Earl Grey. Mr. Moore is, we are glad to know, in the enjoyment of good health, and visitors to the Sydney Garden return to sound the praises of the Garden and its energetic director. The recently-published *Handbook of the Flora of New South Wales* will serve to keep Mr. Moore in touch with the botanists of this side of the world, and add to the chaplet of honour which, as we have seen, is connected with the name of Moore.

COLONIAL NOTES.

QU'APPELLE, NORTH-WEST PROVINCE, CANADA.

The very pretty Sage Brush is to be met with in a greater or less degree all over the seemingly interminable prairie of the North-west Territory of Canada. You may meet with it round about the edges of the bluffs intermingled with other subjects, such as the red and black Cherry, the Saskatoon, and different varieties of Willow, and you will come across it in large or small patches right away in the open, where no other shrub or tree are within sight, though the line of vision may extend for miles in any direction, and the further south the more abundant does this said Sage shrub become. Thousands of travellers by the Canadian Pacific Railway will doubtless have noticed its greenish-grey-silvery and seemingly dust-covered foliage. The plant (a species of Artemisia) does not appear to be particular as to soil, though it is more profuse where light, sandy, or stony soils obtain. The plant bears close-set clusters of small cup-shaped yellow flowers, which smell like honey. The flowers are succeeded by berries [?], which at first are pale green, but when ripe, the seed, which is exceedingly hard, is enclosed within a pure white pulpy substance, the skin of which is smooth and bright. The berry [?], when fully ripe, is about the size of a very fine Black Currant. I do not remember having seen this shrub in the Old Country. Though generally supposed to be a mere shrub, the *New York Sun* says so high an authority as the *Encyclopædia Britannica* refers to it as growing in "treeless valleys and slopes." It will astonish most persons to know that it sometimes grows to such proportions as to provide a section of country with trees of its own wood, producing groves of thick-trunked and comparatively tall trees, instead of mere weeds. Professor Elwood Mead, the State engineer of Wyoming, while exploring the northern end of central parts of that State last summer, came upon a district where the Sage Brush thrived thus gigantically. Many of the Sage trees that he saw were 18 feet high, with trunks at least a foot in diameter. This was in the Big Horn Basin, east of the National Yellowstone Park, and north-east of the Wind River Indian Reservation, where the No Wood River joins the Big Horn. Prairie chicks and bluff partridges feed upon the young leaves and berries of the Sage Brush. *T. S. J.* [We are at a loss to know what is meant. Ed.].

New South Wales.

Australian Sandarach.—In the *Agricultural Gazette* of New South Wales for May, Mr. Maiden calls attention to this product, which is not utilised in

Australia, though Algerian Sandarach is imported in considerable quantities at a high price. Australian Sandarach, it appears, is identical, chemically and physically, with the African product, and is yielded by various species of "Cypress Pines," or Callitris, of which twelve species exist in Australia, C. verrucosa and C. calcarata being the most important from an economic point of view. The collection of the resin is one of those minor industries which could be undertaken by a family of children. Sandarach is used medicinally, but chiefly as a varnish. The "pounce" used for drying ink before the introduction of blotting-paper was made of this substance. The price varies according to quality, from 41*s.* to 56*s.*, and even to 125*s.* per cwt.

Brisbane.

Rice Growing for Market.—A recent bulletin of the Department of Agriculture, Brisbane, Queensland, gives an excellent summary of the history of Rice, together with methods of cultivation and of preparation of the grain.

Jamaica.

Mr. Jenman continues in the *Bulletin of the Botanic Department, Jamaica,* his synoptical list of the Ferns of this island, which doubtless he will reprint later on in some more accessible form.

St. Kitts.

Mr. C. A. Barber has published, in the form of a supplement to the *Leeward Islands Gazette,* a paper on the "Cultivation of Sugar-cane," with especial reference to the diseases which attack it. Of these the most important is the rind fungus, determined by Mr. Massee to be Trichosphæria sacchari, whose mischievous nature was first pointed out by Mr. Hart, of Trinidad. The disease is now universally distributed in countries where the cane is grown. Mr. Barber concludes that the fungus has been in the West Indies for many years. The fungus is the greatest enemy, and the moth-borer is its greatest ally. The fungus rots the cane, and the caterpillar of the moth-borer opens the door for it. The general remedial principles are therefore, says Mr. Barber, (1) to destroy the moth-borer, (2) to render the cane capable of resisting the fungus, (3) to replace the diseased canes by healthy ones. Mr. Barber proceeds at some length to indicate the means of carrying out these measures.

Antigua.

In connection with this cane disease, Mr. Watts, in the previously-named publication, details the measures taken in Antigua to circumvent the dread disease. The Bourbon cane has been shown to be specially liable to be attacked, and hence Mr. Watts and others are now experimenting with other varieties, in the hope of finding one equally productive, but less liable to disease.

Mr. Tillson has issued his report on the condition of the Botanical Station, Antigua. The rainfall for the year amounted to 41·23 inches, the greatest amount in any one month being in September, when 7·84 inches fell; the smallest quantity was in February, when 1·74 inches were measured. In the wet season rain falls on as many as twenty days in the month. In the dry season rain falls on from three to six days. Much activity in the introduction and cultivation of useful plants has been manifested.

The Week's Work.

THE ORCHID HOUSES.

By W. H. White, *Orchid Grower, Burford, Dorking.*

DENDROBIUMS.—The season is now approaching when many plants of the deciduous section of Dendrobium will be completing their growth, and when this has been fully made it is necessary to remove the plants to a cooler and drier atmosphere, where they may receive the benefit of full sunshine, so as to fully consolidate and thoroughly bring the newly-made growths to maturity. But I do not advise their removal from their growing quarters immediately the terminal leaf at the extremity of the bulbs is completed, for it is better where practicable to select a position on one side of this house, where more light and air can be admitted, and less moisture given them. They should also be gradually exposed to the sun earlier in the morning, and the blinds pulled up before the usual time in the afternoon. Should showery weather continue there is no necessity for using the shading at every outburst of sunshine, as these plants will stand a considerable amount of solar light at this period. It is, however, a great mistake to entirely withhold water so soon as the growths are made up, because at this stage, if the plants receive a check through keeping them too dry, they frequently make fresh breaks, and the plants are considerably weakened. I have lately visited several collections, and have seen much injury from such treatment. In order to retain a vigorous and healthy constitution, everything appertaining to the drying and the resting of these plants must be gradual. At the present time those few plants that have completed their growth are sending out freely from the earlier made roots a quantity of young rootlets; these should be encouraged, for upon them no doubt depends very greatly the quality of the future blooms. Until they have made considerable progress, therefore, water must be carefully applied, and when they have obtained a firm hold of the compost, or around the sides of the pot, place the plants where little or no shading is used, such as is afforded by an ordinary greenhouse or vinery, taking care to select a position where they will be free from draught or cold winds. When fully exposed to clear sunshine, the leaves soon turn yellow, but although unsightly, they should not be pulled or cut off, but allowed to fall away naturally. Careful judgment should be exercised in watering the plants when at rest; it is only the grower who studiously attends to their requirements in this respect who knows when they are really dry and when not, because oftentimes, after a hot sunny day, the sphagnum on the surface appears dry, while underneath it is the reverse, and if the plants are watered again the following day, the roots are kept in a constantly saturated condition. Therefore, when once a thorough watering has been given, the plants should receive no more until the whole compost has become dry. Up to the time of writing we have removed a few of each of the following varieties:—D. Wardianum, D. nobile, D. crassinode, D splendidissimum grandiflorum × D. lituiflorum, D. heterocarpum, D. crystallinum, and D. Aspasia ×; also several hybrids of D. Ainsworthii × and D. Findleyanum parentage, viz., D. melanodiscus ×, D. chrysodiscus ×, &c. There are still many plants of the deciduous species, also those of the evergreen section that have not yet completed their growth, which should receive encouragement, regularly supplying them with heat and moisture until they are so far matured that they may be gradually dried and hardened off. Another heat-loving species is D. chrysanthum, and it is of easy cultivation, and a free flowering plant. It also makes one of the best basket plants that can be grown. Suspended from the roof the numerous wax-like golden flowers are seen to the best advantage. This well-known Dendrobium has no particular season of flowering, but will bloom either spring, summer, or autumn, according to the treatment afforded it. A large specimen here has just flowered, and will at once be subjected to the ordinary resting treatment.

MORMODES, CYCNOCHES, CATASETUMS, ETC.—The different species of Mormodes, Cycnoches, and Catasetum being deciduous, will also require a season of rest, and immediately each plant has completed its growth, it should be removed to the Mexican house, where they may receive all the sunlight obtainable. This is an important point towards success, and unless the pseudobulbs are thoroughly ripened by the sun, it is next to impossible to prevent their deterioration. Could we but get sufficient bright sunshine when the bulbs are approaching maturity, we should be better able to give the plants an increased supply of water; the plants would then be able to take up sufficient nourishment to sustain them throughout the resting season. It is best, however, to give just enough water to keep the compost moist, but later on as the leaves commence to turn yellow and fall off, water must be nearly discontinued. Bletia hyacinthina, like the above-mentioned species also requires a rest. At the present time our plants are standing out-of-doors fully exposed to the sun but sheltered from the north and east winds, where they will remain until cold nights arrive.

THE HARDY FRUIT GARDEN.

By T. Turton, *Gardener, Maiden Erlegh, Reading.*

THE MORELLO CHERRY.—As soon as the trees on walls have been cleared of fruit, cut out all the superfluous shoots and those which have fruited this season, tying in as many shoots as may be necessary for securing a crop of fruit next year. Bush and standard trees may be treated similarly, cutting out some of the weaker shoots and those which have fruited, but the operation may be less severe than in the case of wall trees. Dip the tips of any shoots infested with black aphis in tobacco liquor or other insecticide, and in bad cases syringe well the whole of the tree with soap-suds after it has been nailed, which will be more effectual if some tobacco liquor or petroleum is added.

STRAWBERRIES.—It is good practice to make provision for obtaining early runners next season by planting out at this time from fifty to one hundred plants, according to the number of runners that will be required; the flower-stems should be removed as soon as they show themselves in the spring, and strong runners will be ready for layering soon after the middle of June. Fifty plants can be depended upon to produce from 400 to 500 runners by the time mentioned. If such method is adopted, it will be unnecessary to draw from the fruiting plantations, which for many reasons is an advantage. Where Onions are ripe enough to be cleared off the land, no more suitable ground can be got for them, and it will only require to be cleaned by hoeing and raking. The plants should be put out at a distance of 3 feet from row to row, and 15 to 18 inches apart in the row, the latter distance being preferable if the plants are strong. Go over the plantations again for runners, and repeat this as often as they may require it. In some land the plants begin to die off when they are one year old, and any gaps caused in this way should be made good with the strongest of the layered plants, or, better still, from the plants prepared for forcing. We make it a practice to pot a few extra for this purpose. If the forced plants of Vicomtesse H. de Thury were planted out they will have set some fruit by this time, and some litter should be placed under them, or Grass trimmings which do not contain seeds are even more suitable, and this season are easy to obtain.

APPLES AND PEARS.—In gardens where blackbirds and thrushes abound, and where they attack the softer-fruited kinds of Apples and Pears, much attention will now be demanded from the gardener to protect the crop, unless some steps are taken to trap or in other ways lessen their number. We trap large numbers in the netting over the Gooseberry quarter. After gathering all the finest fruits, sufficient are left as bait for them; the net being lifted up at one end to allow the birds to enter, is well secured at the other parts. The net is also made to project at one end for a few feet, and about the size of a sack, thus making a double trap, by which they are the more easily caught. If the trees are too large to be netted over, any particularly fine specimens may be effectually protected from the blue-headed tom-tit by placing a collar of stout paper over the base of the fruit, and the aperture made to pass the stalk through, closing by pinning it up, and placing small nets under the fruits to protect them in the event of their falling.

NUTS.—Cobs and Filberts are exceedingly plentiful this season, but if the squirrels be unchecked they will quickly clear off all the finest nuts, so that a sharp look out must now be kept for them, and resort had to the gun in the event of their finding them out.

PLANTS UNDER GLASS.

By J. F. McLeod, *Gardener, Dover House, Roehampton, S.W.*

ZONAL PELARGONIUMS.—Plants which have been grown for autumn display will under favourable conditions have filled their pots with roots, and with a view to sustaining the essential vigour of the plants, recourse must be had to feeding, which may be done by liquids or solids, preferably the latter in a season such as the present. Give them a top-dressing with a reliable artificial manure, say Clay's Fertiliser, or Thomson's Vine and Plant Manure, either of which may be applied, at the rate of a dessert spoonful to a 5-inch pot of rich loam, which, when well mixed, will be a safe and efficient tonic. Freely expose the plants to the sun, that a hard and well-ripened condition be the result, and when the weather permits, remove the lights from the frames in which they are growing. The double and semi-

double forms should be more numerous than the single varieties, as the former are so much more useful in a cut state. Amongst the best of these are Aglaia, Charles Lalande, F. V. Raspail, Germania, Toulouse, Circe, and Triomphe de France. Single-flowered varieties may include Agnes, Duchess of Portland, Hecla, Jubilee, Etna, Puritan, and Clara Palethorpe. The show and fancy varieties should now be cut back somewhat closely, keeping the roots dry until such time as satisfactory growths have formed, when they may be shaken out and repotted into rich loamy soil, into which has been well mixed a good proportion of sand. Stand them near the glass in pits, and moisten the foliage twice daily.

FUCHSIAS.—Prolong the flowering season of partly exhausted plants by a regular application of farmyard-drainings, where this can be done without giving offence; but in other cases a less pungent fertiliser should be substituted. Young stock for late autumn service needing potting should be attended to at once, that the wood can be sufficiently ripened before cold weather sets in. A little pinching of the shoots, in order to obtain a pleasing shape, may be done, but anything approaching formality should be strictly avoided.

AURICULAS.—The show varieties should now be overhauled, potting those which require it into fibry loam and sand, with a slight addition of dried cow-dung; the soil, which should be fairly dry, must be pressed firmly about the roots, removing all offsets, which may afterwards be placed singly into thumb-pots, or three in a 3-inch pot, to avoid handling again at a future date. The frame or pit into which they are to be placed should be thoroughly cleaned, the woodwork and glass with soft-soap, rain-water, and a little paraffin, and the walls should be coated over with lime, into which has been added a little paraffin.

TREE CARNATIONS.—Remove all flower-buds as they appear, pinching off at the same time a portion of the growths. Encourage young stock for flowering next season by repotting any that require it, and attend to watering. In hot weather the plants may be syringed over in the afternoon and evening.

THE WARM FERN HOUSE.—Early removal of the decayed fronds will be necessary in maintaining a fresh and clean appearance. The potting of any particular sort may still be carried out, but the season is too far advanced for this work to be done generally with advantage. A fresh batch of pots and pans of the various Selaginellas should be put in the warmer end of the house, until fully established; the annual autumn overhauling may well be deferred for some time. Begonias of the Rex type usually outgrow their quarters, and should be removed and smaller plants substituted; the large leaves will, however, prove useful, for if treated as advised in a previous issue, they will readily form plants. Panicums, Fittonias, Sonerilas, and such subjects should also be replaced by younger stock, the varied colours of these latter contrasting well with the fresh green colour of the Ferns. A few Caladiums may also be introduced; and another subject having a good effect in the house, though it does not last so long as some others, is the Globe Amaranth.

THE FLOWER GARDEN.

By JOHN LAMBERT, *Gardener, Powis Castle, Welshpool.*

ROSES.—Continue to bud these at every favourable opportunity, and if there should come dry weather, afford them plenty of water. Cuttings of China and Teas may be put in as soon as the growths become sufficiently firm. Where it is wished to have a supply of autumn blooms, the plants should be pinched back and every encouragement given to induce fresh growths, which must be kept free from insects by frequent syringing, both with clear water and with insecticides. Beds of Roses will need constant attention in regard to keeping removed all dead blooms, and all superfluous shoots. Should the surface-soil become caked, it should be lightly forked over, and then given a good soaking of manure-water.

CREEPERS.—Plants of Tropæolum canariense, T. Ball of Fire, Cobœa scandens, Nasturtiums, Lathyrus, &c., will need attention every few days. Thin out the shoots a little, and give a tie in places where wind may prove disastrous to them.

SHRUBS.—Many of the deciduous shrubs, such as Cratægus, Chestnuts, Lilacs, Maples, and Prunus, may now be budded. When it is wished to bud trees of any size with another variety, as may be the case with Cratægus, which have been unsatisfactory, they should be cut well back during the previous season, and young growths encouraged, the best placed of which may be chosen for operating on. In selecting the buds, let that portion of the young growths next to the older wood be chosen, provided the buds are plump, and not injured by frost. Care must be taken to ascertain that the bark may be easily lifted before commencing operations.

VERBENAS.—Beds of these will require to be gone over and the seed pods removed, if it is desired to obtain the best results, and they should be kept well-thinned by having a portion of the weaker shoots removed to let plenty of sun and air in amongst the plants, which will do much to prevent mildew; a pest certain to attack them when they are allowed to become weakly through over-crowding. Cuttings taken now, will soon root if placed in a cold frame with a very slight bottom heat, and these will form a good stock to propagate from in the spring.

AZALEA MOLLIS, ETC.—Beds of these which were cut by severe frosts in the spring, and were therefore late in making growths, should be given a good soaking of manure-water as soon as the weather permits. Plants of the Ghent section which should ere now have had all the seed-pods removed may be treated similarly, also any plants which, having been forced, were afterwards planted out in the reserve garden. Seedlings in boxes should be pricked-off as soon as they can be conveniently handled, and kept close for a few days to enable them to obtain a fresh root-hold.

SPRING BEDDING PLANTS.—Where spring bedding is employed, the various plants which have, as previously advised, been planted out in the reserve garden, or on a north border, must be looked over, and if necessary the stock may be increased either by cuttings or division. Alyssum and Iberis of the different varieties may be propagated by cuttings of the young growths, choosing those of the firmest texture, which if a frame or handlight be not available, may be dibbled firmly into a bed composed of rather light soil on a north border, where they will soon root, if ordinary attention be given as regards water, &c. When they have taken root the tops should be pinched out, to induce bushy growth. Saxifrages are also useful for this purpose, the common umbrosa, granulata, and several others being amongst the best; these may still be propagated by carefully dividing the growths with roots attached, which should then be planted out as advised. Aubrietias and Arabis may also be propagated by division, which, if carefully done, will ensure a few roots being attached to each particle.

FRUITS UNDER GLASS.

By BAILEY WADDS, *Gardener, Birdsall Gardens, York.*

KEEPING GRAPES.—Ripe fruit will require considerable attention and protection at this season from flies, wasps, and other enemies. Muslin bags will keep off flies and wasps, but they encourage mould and decay in the berries, and are not to be recommended. Wasps are not so troublesome this season as they were last, and unless a sudden invasion of them should take place, it is better not to use netting or any other covering over the ventilators, or to stop the free circulation of fresh air in any way. Keep plenty of Tomato plants growing in pots, and place them about the vineries. Look carefully over the bunches, and remove all decayed berries. During damp weather give a little fire-heat about every other day, with abundance of air, leaving the top ventilators of the house open all night. If there are not many bunches left on the Vines, the better plan is to remove them as soon as possible, and they will keep in good condition for some time if cut with a good portion of wood and foliage, and placed in bottles of water in the fruit or Grape-room. Attention may then be given to the thorough cleaning of Vines that are infested in any way with insect pests; and before the season is far advanced the Grape-room should be well cleaned throughout, and white-washing, painting, &c., attended to. One of these useful rooms should be in every garden where there are many Grapes grown, as very little expense is required in fitting them with strong wood and iron racks, fixed against the wall about 18 inches apart. I find the ordinary claret bottle with a wide mouth the most useful for holding the Grapes; they hold a good supply of water, and will admit a strong Vine shoot well into the bottle, which is an advantage. Abundant ventilation should be provided back and front, and these ventilators should be covered with perforated zinc or small-mesh wire netting, to keep out wasps and flies. A flow-and-return 4-inch hot-water pipe should run round the room, for reducing excessive moisture when required. The most convenient situation for this room is that adjoining the fruit-room, and a good position for both is against the north wall, and as near the vineries as possible.

APRICOTS.—Apricots in glass sheds or houses, or those growing in pots, that have carried heavy crops of fruit will need careful attention to root-watering, and as soon as the crop is all gathered, a thorough washing of the trees with the hose-pipe or garden-engine should be given to clean them from insect pests. In cold districts where the outside crops of these useful fruits are uncertain, the glass-shed system should be adopted. These glass-sheds rest on one side on a low wall, and the other on iron pillars and are left quite open. The trees are planted against the open side, the roots running into an outside border, and the trees are trained to a trellis under the glass. It is quite an old plan, but it is just what the trees and fruit require, protection from rough weather, with abundance of air at all times. Afford care to young trees, tieing and training them as soon as they require it, and see that the early ties are not too tight; it is often the forerunner of canker and decay in the trees. Where new plantations are in contemplation, sheds should be built and new borders made during the autumn months, so that the trees may be planted at the fall of the leaf, which is a great advantage.

THE KITCHEN GARDEN.

By ARTHUR COOMBES, *Gardener, Himley Hall, Dudley.*

CAULIFLOWERS.—It is now time to commence the sowing of these, which are to stand over the winter under frames or other protection. No variety succeeds better than Early London. The small early kinds of Cauliflowers are more satisfactory when sown in heat in January; they come in quite as early as if sown in autumn, and but few of them head in prematurely, whereas if sown now a large percentage of them are liable to do so. Where the garden lies very low, and is subject to much fog and damp, I would prefer sowing all varieties in heat in January to doing so now. Where autumn sowings are likely to succeed, an open sunny position away from shade of any kind must be chosen for the seed-bed, and after digging or forking the ground, which should be well broken up, sow the seed thinly in shallow drills 6 inches apart, after which cover the beds over, and protect from birds.

LETTUCES.—Sowings should be made forthwith of such hardy kinds as Black-seeded Bath, Hick's Hardy Cos, All the Year Round, and Stanstead Park Cabbage varieties. An open position should be chosen, and if the ground be at all pasty, add dry soil about the seeds. Transplant in quantity from the previous sowings, so as to have plenty to lift and place in frames later on.

BASIL.—Sow now in boxes or pans for a supply of green leaves during winter, using a light free soil, and avoid crowding the seeds. Place for the present in a cold frame, and when the young plants appear, attend carefully to the watering.

CHERVIL.—If green Chervil is in much request, it is advisable to sow now on a warm border, subsequently planting a portion of the thinnings in a cold frame to furnish leaves in the winter, when that outside may be frozen or covered with snow. A light soil, not over rich, is most suited to its requirements, and the drills should be about 6 inches apart. If a few seeds are scattered at the foot of a south or west wall, they will afford plants which will be useful in the spring.

GENERAL WORK.—The planting out of Broccoli and Borecoles should now be brought to a close as speedily as possible, and every part of the garden should be cropped to its utmost capacity; there should not be any vacant land now. Runner Beans that have reached the top of the sticks should be topped, and when gathering, care should be taken that none are left to become old, or they will grow on, forming seed at the expense of others that are forming. The frequent showers of late have made it difficult to ply the hoe, and weeds are again in the ascendant; where any are advanced, hand-weeding should be resorted to without delay, so that seeding may be positively prevented.

APPOINTMENTS FOR THE ENSUING WEEK.

SHOWS.

WEDNESDAY, Aug. 22 — Shrewsbury Great Floral Fête (two days). Kingswood, St. George's, and West Gloucestershire Horticultural Society, at Kingswood, near Bristol.

SALES.

MONDAY, Aug. 20 — Special Trade Sale of Dutch Bulbs and Lilium Harrisi at Protheroe & Morris' Rooms at 12.

THURSDAY, Aug. 23 — Special Trade Sale of Dutch Bulbs at Protheroe & Morris' Rooms at 12.

FRIDAY, Aug. 24 — Orchids at Protheroe & Morris' Rooms at 12.30,

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—61°·4.

The British Association.

The Oxford meeting has been a great success. Lord Salisbury's judicial address gave satisfaction to most folk. His reminder of the extent of our ignorance was wholesome, though the sting was partly removed at the very same meeting by two evidences of progress, the announcement of the discovery of a probably new element, and by the exhibition of the prothallia of a Lycopodium. An address like Lord Salisbury's would not have been possible a quarter of a century ago, when Bishop Wilberforce uttered futile fulminations on matters he did not understand, and indulged in personalities for which he was well and deservedly trounced by Professor Huxley. Since then the principle of evolution has triumphed all along the line, and in spite of the acknowledged deficiencies in our knowledge Lord Salisbury could but bless what his forbears condemned as false. Section D, Biology, was presided over by Professor Bayley Balfour, who, after alluding to the death of Professor Romanes, and to the changed conditions under which botany is now studied, devoted the greater part of his address to the subject of Forestry. We greatly rejoice at this as a sign that some day we may expect the Association and the University to recognise the claims of cultural science, including the principles of Agriculture, Horticulture, and Forestry, and their application to practice far more fully than they do now. Prof. Balfour sketched the present state of forestry in this country, and enforced the necessity for placing its study on a proper footing. The establishment of teaching stations in state-forests is one of the essentials for forestry in Great Britain, because the true solution for the Forestry question is to be found in the diffusion of accurate knowledge of forest science. Prof. Balfour went on to show that the practical aspects of Botany were not sufficiently considered now-a-days, that whilst chemistry and physics were turned to utilitarian purposes, botanists confined their attention too exclusively to matters of pure science—"To botanists we must look in the first instance for the propagation of the scientific knowledge upon which this large industry must rest. They must be the apostles of forestry. And Forestry in turn will react upon their treatment of Botany. Botany cannot thrive in a purely introspective atmosphere. It can only live by keeping in touch with the national life, and the path by which it may at the present time best do this is offered by forestry." If to forestry be added gardening, market-gardening, and agriculture, including vegetable pathology, we fully concur with the Professor.

The part which Horticulture plays in promoting the welfare of the nation in many ways is only partially appreciated by the public, owing to the notion, fostered unintentionally by flower-shows, that gardening is an amusement only. The scientific aspects of horticulture were thoroughly appreciated by the late Charles Darwin, who found countless instances among cultivated plants to support his views of progressive development and of retrogression, and yet up till now we do not remember that the subject has ever been taken up by the Association.

Among the foreign botanical members present at the meeting, we note the names of Professor Douglas H. Campbell of the University of California, Errera of Brussels, Focke of Bremen (Hybrids), Kny, Pfeffer and Pringsheim of Berlin, Riley (late Government Entomologist, U.S.A.), and Strassburger, the latter of whom we are delighted to see received the academic distinction of D.C.L. from the University. The botanists were mostly housed in Magdalen College, in close proximity to the Botanic Garden and Library; but the way in which their meeting-place was changed from day to day was anything but pleasant.

Some botanical papers of much interest were read, and Professor Strassburger exhibited the prothallia of a Lycopodium, which possessed great attraction for the members from its intrinsic interest and the rarity of its occurrence; but on the whole the character of the papers amply bore out the President's remarks. Miss Benson's paper extending the researches of Treub by showing that the ovules of some of the Amentiferæ are fertilised through the chalaza instead of through the micropyle, is, of course, most interesting and suggestive to botanists; but the facts are too new and too isolated at present to enable us to take them, as some have already done, as the basis of a scheme of classification. To found a classification on such a small number of ascertained facts is to court failure. In the meantime, what will the outsider make out of the title of this paper, "On the Phylogenetic Position of the Chalazogamic Amentiferæ?"

To-day, Thursday, parties of the Association are to visit Windsor and Reading, at which latter place they are to visit the establishment of Messrs. Sutton.

Magnolia Watsoni.*—This is a comparatively new Japanese, deciduous Magnolia, named by Sir Joseph Hooker in compliment to Mr. Watson of Kew. It forms a small tree, which produces leaves and flowers at the same time. The margins of the leaves are edged with a narrow yellow band. The flowers are cream-coloured, the filaments of the stamens crimson. For the rest, our illustration (fig. 29) gives a good idea of the plant, for a full botanical description of which we refer to t. 7157 of the *Botanical Magazine*. Mr. W. G. Smith's drawing was taken from a plant exhibited in the course of this summer at the Royal Horticultural Society by Messrs. James Veitch & Sons.

Monthly Meeting at Ghent.—At the August meeting of the Chambre Syndicale des Horticulteurs Belges and la Société Royale d'Agriculture et de Botanique of Ghent the following awards were made:—Certificates of Merit for Ceratolobus concolor, for Zalacca nitida (*à l'unanimité*), and for a hybrid Cypripedium (insigne Chantini × Lawrencianum), all three staged by M. Em. De Cock. Other Certificates were awarded for Alocasia Watsonii (*par rappel*) and for a seedling Croton, both from M. Ch. Petrick; also for Cypripedium Charlesworthi (*par acclamation*), from M. Ed. Pynaert; for Begonia striata, from M. Aug. Toeffaert; for a Cochin-Chinese species of Cycas, from la Société Horticole of Ghent; and for Dracæna indivisa, variegata, from M. Millet-Richard. M. Jules Hye was awarded a Botanical Certificate for a species of Catasetum. Certificates of Merit for cultivation and blooming were awarded to Philodendrum Corsinianum (*à l'unanimité*), shown by the Ghent Société Horticole; Agave albicans, from M. C. Bedinghaus; Aralia elegantissima, from M. E. De Smet-Duvivier; Eucharis amazonica (*à l'unanimité*), from the Ghent Société Horticole; and for Miltonia Morelliana, Odontoglossum brevifolium, and Vanda Wallichi, all three from M. J. Hye; also for Curculigo recurvata, fol. var, from the Société Horticole of Ghent. An Honourable Mention was awarded to M. Trangot Sweczick, for his collection of cut flowers of double-blooming tuberous Begonias.

* Magnolia Watsoni, J. D. Hooker in *Bot. Mag.* (1891), t. 7157.

Bananas and Plantains.—A very complete and exhaustive paper on these plants forms the August number of the *Kew Bulletin*. It is in reality a monograph of the genus Musa, though entitled "A Summary of Information relating to Bananas and Plantains, with Descriptions of the Species and principal Varieties of Musa grown for Ornament." The history, botany, geographical distribution, cultivation, marketing, the diseases to which they are subject, the uses to which they may be put, the chemical composition, are all dealt with at some length. Advantage has been taken of the publications of Baker and others as to the botany, of Professor Church's researches as to the chemistry, and, as it would seem, of everything of importance that has been published upon the subject. Numerous illustrations are supplied, but one defect remains to be noted—there is neither a general summary of contents nor an index. Both these might be supplied in the next number of the *Bulletin*.

Mr. G. Woodgate.—This well-known gardener, who served the late Lord and Lady Wolverton at Coombe Warren House, Kingston, for fifteen years, has just been appointed Head Gardener to Sir Oswald Mosley, Bart., Rolleston Hall, Burton-on-Trent. Mr. Woodgate, who was for eight years Secretary to the Kingston Chrysanthemum Society, retired from office last spring because of the contingency that has now arisen. His term has been one of peculiar prosperity to the Society, as during that time subscribers have greatly increased.

Mr. Weathers has established at Silver Hall Nursery, Isleworth, an Orchid exchange or medium, through which duplicate Orchids of all kinds may be exchanged, bought, or sold.

Horticultural Shows.—We have received reports of shows held at Headington (Oxfordshire), Nuneham Courtney (Oxfordshire), Carshalton (Surrey), and others.

Gratifying Recognition of Services.—Dr. and Mrs. Izod have presented to Mr. George Holden, who has been in charge of the gardens at their residence, The Lammas, Esher, Surrey, over ten years, a handsome silver drinking cup, on which his initials and the date of the presentation are engraved, together with the monograms of the donors. When handing the gift over, Dr. Izod expressed the hope that Mr. Holden might continue in his service as long as he was spared to require a gardener. Not only is Mr. Holden appreciated for his devotion to the interests of those whom he serves, but the way in which he discharges the duties of Secretary to the Esher Cottage Garden Society is watched with interest by Dr. and Mrs. Izod. He has been in that office six years, and the Society bids fair to become a firmly-rooted local institution.

Royal Purveyors of Implements and Cutlery.—The Standard Manufacturing Company, St. Alkmund's Churchyard, Derby, who are makers of horticultural, agricultural and arboricultural implements and cutlery, &c., have been appointed as purveyors of horticultural implements and appliances to Her Majesty the Queen.

FIG. 29.—MAGNOLIA WATSONI: FLOWERS CREAM-COLOURED, WITH A CRIMSON CENTRE. (SEE P. 188.)

Widdringtonia Whytei.—We are indebted to Mr. Medley Wood, of the Natal Botanic Gardens, for specimens in the seedling stage of the interesting Widdringtonia Whytei, recently described in the *Transactions of the Linnean Society*. The tree is a Conifer, inhabiting the mountains of Nyassaland in East Central Africa, and is closely allied to similar forms in South Africa and Natal, and more remotely to Australian forms. The leaves in the specimen before us are in four vertical ranks, but spirally rather than decussately arranged. Each leaf is about 2 centimetres long, spreading horizontally, greyish-green, linear apiculate, with the midrib on the under surface prominent between two glaucous stomatic bands. Upper surface convex, green, midrib prominent at the base only.

Patriotism. — The *Bulletin d'Arboriculture* pokes a little fun at us as a nation, on account of our insular conceit. Here is the story told by our Belgian friend. "Who was the first man?" asked an English teacher of his pupil. To which the answer came immediately, "The Duke of Wellington." "Oh!" said the tutor, "have you never heard of Adam?" "Certainly," was the reply, "but he was a foreigner!"

Scottish Horticultural Association.—The following specimens were exhibited by Mr. Chapman, Easter Duddingston Lodge, at the meeting of the above Society held in Edinburgh on Wednesday, the 8th inst.:—Sprays of Rose Crimson Rambler, cut from the original plant introduced from Japan in the year 1879; well-flowered specimens of Ligustrum sinense, Olearia Haastii, Mutisia decurrens, Desfontainea spinosa, Spiræa japonica, S. Lindleyana, and Podophyllum Emodi in fruit.

"Willows and their Cultivation."—This is the title of a paper in the *Journal of the Royal Agricultural Society* for June last, by Mr. E. J Baillie, of Chester. In this paper the author deals with the botanical characteristics and classification of Willows, their trade uses, method of cultivation, and other matters to which we must recur when our columns are less crowded.

Mr. Michael Barker, who till now has been Assistant-Superintendent of the Harvard Botanic Garden, Cambridge, Mass., writes us that he has been appointed Superintendent of the Cornell University Experimental Gardens, Ithaca, N.Y.

Seedless Fruits. — We are familiar with "Currants," those seedless Corinth Grapes which form so large a constituent of our Christmas puddings. We know also of Sultanas, of Black Monukkas, of stoneless Berberries, of Bananas, of Poires sans pepins, and other cases where the fruit swells, but wherein the ovules are either not formed, or remain unfertilised. What is it then that causes the ovary to ripen into the fruit in such cases? The answer, according to M. Muller, is that the swelling up of the ovary is due to the stimulus set up by the germination of the pollen-tubes on the stigma, even in cases where, from whatever cause, the ovule itself, or rather the germ cell within it, is not and cannot be fertilised. There is, according to M. Muller, whose paper in some Swiss publication is analysed in the *Annales Agronomiques*, July 25, a particular variety of Grape known as "Aspirant," the ovules of which can never be fertilised, as they are always monstrous and contain no germ cell (oosphere). If access of pollen be prevented the ovaries of these Grapes do not swell, but if the pollen is allowed to come in contact with the stigma, the ovary ripens even though it has no contents. The action of the pollen on the ovary thus receives another illustration.

Stock-taking: July. — The failure of the American Legislature to pass the Wilson Tariff Bill into law has had a markedly depressing effect on the output and purchase of British and Irish manufactures, and the quantity and value of the imports during the past month have shown "sympathy" by curtailment. "'Tis true, 'tis pity, and pity 'tis 'tis true." No forcing of markets is possible with war in the East and party and labour strife in the West. We can only hope for peace, strive after and deserve success. From the "summary" table of the imports of foreign and colonial produce during July, we find the deficit amounting to £1,447,638; but there is still a balance in our favour for the seven months of £11,913,069, as compared with the same period last year. Noticing an increase in the value of hemp imports, we are reminded that Queensland to the new industry of silk production has added that of hemp, samples of which sent on to Dundee for trial have been most satisfactorily reported upon. China being at present in evidence, we may note that the import of tea from that old land does not increase, but 12 per cent. of the huge annual total of Tea of all descriptions came from the Celestial Empire, the remainder reaches this market from British Possessions, grown by British capitalists. Surely the disease of the Coffee plant in Ceylon was a blessing in disguise. The following figures are extracted from the monthly summary in the "Returns":—

Imports—July.	1893.	1894.	Difference.
	£.	£.	£.
Total value of imports	33,293,191	31,845,553	—1,447,638
(A.) Articles of food and drink—duty free	13,499,803	12,267,448	—1,232,355
(B.) Articles of food and drink, dutiable	2,029,041	2,020,405	—8,636
Raw materials for textile manufactures	3,385,030	2,772,042	—612,988
Raw materials for sundry industries and manufactures	4,282,287	4,063,668	—218,619
(A.) Miscellaneous articles	1,127,084	1,078,003	—49,081
(B.)—Parcel Post ...	38,503	49,602	+11,096

Very interesting are the figures relating to the imports of fruits, &c., during the past month it would be of value could we get an approximate idea of the Continental supplies during the autumn and winter; Mr. Gardner, of the Board of Agriculture, might interest himself in this. Our usual excerpt is as follows:—

Imports—July.	1893.	1894.	Difference.
Fruit, raw:—			
Apples ... ... bush.	114,939	55,362	—59,607
Cherries ... ... ,,	53,188	99,917	+46,729
Plums ... ... ,,	355,725	165,134	—190,591
Pears ... ... ,,	229,821	154,082	—75,739
Grapes ... ... ,,	34,054	6,500	—27,554
Unenumerated ... ,,	219,240	301,771	+82,531
Onions ... ... ,,	297,253	283,286	+13,967
Potatos ... ... cwt.	253,309	570,773	+317,464
Vegetables, raw, unenumerated ... ... value	£ 146,549	£ 156,172	£ +9,623

We have now to place on record the falling off in our

Exports.

But before doing so, we call attention to a serious oversight by our merchants. At the commencement of the Tariff War between Russia and Germany we noted the possible opening for British manufactures in the Russian market presented by the "falling-out" of the two nations. The suggestion was unnoticed, the quarrel has been settled; and it will be years before we can make up for lost ground. Our Consuls on the spot have just now drawn attention to the facts of the case. Coming to the exports for July there is a deficiency of some £1,252,838 as compared with July, 1893, and a loss in value of £2,147,303 for the seven months of 1894 as compared with the same period last year. The comparison is a fair one for the month, for there were the same number of working days in each case. The falling off in the American business is the principal cause of the decline. It was recently noticed here that in Honduras the shrewd agriculturist with some capital might find a paying field for his enterprise and skill. It may here be stated, that there is a new opening for the viticulturist much nearer home—Andalusia. An Australian agricultural expert has been touring through the province, and finds there everything necessary for successful culture—good and cheap land and labour, a fine climate, a market close at hand. A large amount of English money is now advantageously "placed" in Spain—perhaps the area of operations may be extended as suggested by our Australian friend. [Since the above has been in type, an arrangement has been arrived at between the American Senate and House of Representatives, which permits of a new tariff arrangement coming into force. Ed.]

Royal Scottish Arboricultural Society.—We have received a report of the Annual Meeting of this Society, held in Edinburgh on the 6th, and of the subsequent excursions, but are unable to publish same until our next issue.

The British Pteridological Society.—On Monday, August 6, the annual meeting of this society was held at the Institute, Bowness, Windermere. Prior to the formal business of the meeting, some interesting exhibits were displayed of fronds of new varieties found or raised by the members. Amongst those of special interest were several exhibited by Dr. F. W. Stansfield, the President, one evoking much admiration, consisting as it did of a frond from Col. Jones' wonderful plumoso-densum Polystichum, well known at all prominent exhibitions, in which the delicately-cut foliage is profusely sprinkled with a pure white variegation, forming a singularly beautiful combination. Another distinct advance was evidenced in an improved A. F.-f. Kalothrix, named A. F.-f. K. foliosum, of which the parent has hitherto been deemed the acme of perfection in its way. Some fine examples of the pulcherrimum section of shield Ferns also far eclipsed their progenitors, so that abundant evidence was forthcoming of progress, and that in the right direction. In this connection it was remarked that the old catalogues extant describing the varieties of thirty years ago, when British Ferns first became popular, scarcely contain 1 per cent. of forms now recognised as first class, so great has been the improvement and consequent weeding-out which has taken place in the interim. Mr. W. H. Phillips exhibited a large number of fronds, representing Irish finds, and many of great beauty, and some singularly similar to marked, and for a long time unique, plants found in the South of England. The whole of the officers were re-elected, and votes of thanks duly passed. The President then gave an address, in which he dwelt mainly upon the vexed question of nomenclature. This, he said, has hitherto been effected in three ways, viz, the descriptive, the commemorative, and the nondescript, the first involving a description of the main varietal characteristics in Latin; the second simply giving the name of locality where found, or finder, such as Cambricum, Axminsterense, or Smithiesii; and the third involving many absurdities, such as complimentary personal names having no reference to the finder, or merely would-be descriptive ones, which are simply misleading. Of these three he strongly advocated the first as being the most rational, adding the finder's name in English where the variety was not sufficiently distinct to justify further specialising. These views found general acceptance, and it was felt that any approach to the floral method of naming, *i.e.*, to give purely complimentary personal names, would be distinctly wrong and absurd. Mr. Chas. T. Druery then followed with a paper on "Selective Culture of British Ferns," in which, while giving illustrations of happily combined forms by crossing, and indicating his ideas of the lines to be pursued to improve existing good types, and eliminate inferior ones, he impressed upon the members the great importance of this latter process, since there is no question that British Ferns have largely suffered in popularity, and the difficulties of nomenclature are greatly enhanced by cultivators growing on a legion of inferior forms, which simply swamp the better ones. Mr. W. H. Phillips, Belfast, then read a paper on "Fern Hunting in Ireland," which he illustrated by the collection of

fronds above alluded to, in an interesting fashion. Some new plants were then produced for naming—one a new and extremely fine form of Blechnum Spicant, shown by Mr. Forster, and named plumoso-cruentum, being quite a new departure in the species. A very curious small Athyrium, named grandidens Mrs. Wilson, was also much appreciated; this was found in Troutbeck. Finally, it was resolved that the annual meeting of 1895 should be held at Kendal. The next day a trip was made by the majority of members present to the lovely district of Langdale, under the shadow of whose gloomy Pikes several pleasant hours were spent in Fern hunting. One or two good things were bagged, among them a very neatly crested form of L. montana, a beautifully variegated form of some species, and a singularly distinct lineal variety of Pteris aquilina, of which species a grand "revolvens" form had previously been found by Mr. Druery in the very heart of Windermere town itself. Fern lovers are requested to communicate with the Secretary, Mr. G. Whitwell, Serpentine Cottage, Kendal; or with Mr. C. T. Druery, Fernholme, Forest Gate, with a view to its extension.

Publications Received.—*The Wild Garden.* By W. Robinson; illustrated by Alfred Parsons. (John Murray.)—*Talks about the Soil in its relation to Plants and Business*, by Charles Barnard.—*Talks about the Weather in its relation to Plants and Animals*, by Charles Barnard.—*Talks about our Useful Plants*, by the same. The three books just mentioned are published by Funk & Wagnall's Company, 44, Fleet Street, and will require further notice on another occasion.—*Pflanzen Teratologie, zweiter Band*, von Dr. O. Penzig, Genoa. This important work also necessitates detailed notice later on.

PLANT PORTRAITS.

Apple, Tolman's Sweet, *Canadian Horticulturist*, July, chiefly useful as food for stock.

Clematis, Madame van Houtte, and 2, Lady Caroline Nevill, *Revue de l'Horticulture Belge*, August.

Cypripedium Leysenianum C. barbatum Crossianum ♀ × C. bellatulum ♂, *Revue de l'Horticulture Belge*, August.

Cypripedium Peteri, *Reich. Wiener Illustrirte Zeitung*, June.

Deutzia discolor, var. purpurascens, *Garden and Forest*, July 18.

Peach, Early Alexander, *Bulletin d'Arboriculture, &c.*, July.

BELGIUM.

ANTWERP EXHIBITION.

Our Belgian contemporaries are loud in their praises of the special exhibition got together a short time since as a compliment to their Majesties the King and Queen of the Belgians. The "salon royal" was decorated with ornamental and flowering plants, objects of art, &c., according to the plans of M. Guillaume de Bosschère, and the effect was admirable, as is indeed shown in some photographs before us, some of which we may hereafter reproduce. Belgian amateurs and nurserymen freely lent their Palms, Tree Ferns, and Orchids, &c., and left the designer, M. de Bosschère, to group them as he pleased. No awards were made, and not even the name of the exhibitor was displayed on the groups, so that the horrid ticket nuisance was non-existent. It will be remembered that this was not a commercial display, but a tribute of the horticulturists of the kingdom to their King and Queen. Unfortunately, the terrible catastrophe of the death of M. Carnot prevented the King from being present. The initiative of this unique and splendidly-successful exhibition is due to our colleague, M. Charles de Bosschère, to whom the horticultural press pay handsome and well-merited tribute. When we can get a flower show on like conditions, we, too, may be able to produce something better than the muddled, crowded, label-bespattered stages we call a flower-show.

TOURNAI.

A great horticultural exhibition is to be held at Tournai from September 9 to 12 next. There are 171 classes in the schedule. Foreign competitors are invited, but should make known their wishes before the 25th inst. All communications should be addressed to the secretary, 4, Rue Catrice, Tournai, Belgium.

NEW TENNIS MARKER.

Messrs. W. Reid & Leys, of Aberdeen, send us a photograph of a new tennis marker, which is intended to supersede the ordinary machine in which whiting is used. The drum at the top is made of steel, and is filled with sawdust, which is conveyed down the square shaft. At the bottom is a steel spindle, into which flat plates of steel are inserted.

Fig. 30.—A new tennis-marker.

The revolution of these plates causes the sawdust to be ejected in a continuous stream of uniform width. When the court is being marked, a line is laid down, and the machine run along the line, as shown in the illustration, fig. 30.

HOME CORRESPONDENCE.
